Trade-Mark Registrations Canceled

69,928. Glass tubes. Schott & Gen., Jena, Germany. Registered July 21, 1908. Canceled July 9, 1946.

359,049. Certain named clothing. Princess Junior, Inc., New York, N. Y. Registered Aug. 2, 1938. Canceled July 9, 1946.

382,794. Certain named toilet preparations. Martin de Botelho, New York, N. Y. Registered Nov. 12, 1940. Canceled Aug. 13, 1946.

382,987. Certain named toilet preparations. Martin de Botelho, New York, N. Y. Registered Nov. 19, 1940. Canceled Aug. 13, 1946.

382,988. Certain named toilet preparations. Martin de Botelho, New York, N. Y. Registered Nov. 19, 1940. Canceled Aug. 13, 1946.

395,610. Vehicle wheel aligning devices for shop service. Thompson Products, Incorporated, Cleveland, Ohio. Registered June 2, 1942. Canceled Aug. 7, 1946.

413,375. Fabric covers for buttons, etc. Walter P. Taylor, New York, N. Y. Registered Apr. 17, 1945. Canceled July 9, 1946.

Disclaimers

2,277,941.—*Richard Almy*, Lancaster Township, Lancaster County, Pa. Manufacture of Shoes. Patent dated Mar. 31, 1942. Disclaimer filed Aug. 26, 1946, by the assignee, *Armstrong Cork Company*.

Hereby disclaims the subject matter of claims 25 and 31; from claims 1, 2, 7, 8, 22, 32, and 33 the use of phenol aldehyde resin; from the scope of claims 9, 15, 16, 17, 18, 20, 26, 27, 28, 29, and 30 phenol aldehyde resin; from the specification of said Letters Patent, page 3, column 1, lines 11 and 12 the words "or phenol aldehyde resins"; the descriptive matter commencing at page 4, column 1, line 48 and extending through page 4, column 2, line 29.

2,381,079.—*Charles A. Pittman, Jr.*, Sellersville, Pa. Variable Speed Phonograph Drive. Patent dated Aug. 7, 1945. Disclaimer filed Aug. 15, 1946, by the assignee, *Philco Corporation*.

Hereby enters this disclaimer to claims 1 and 2 of the said Letters Patent.

2,388,599.—*John C. Cleaver* and *Jules Verne Resek*, Whitefish Bay, Wis. Distillation Unit. Patent dated Nov. 6, 1945. Disclaimer filed Aug. 28, 1946, by the assignee, *Cleaver-Brooks Company*.

Hereby enters this disclaimer to claim 4 of said Letters Patent.

Notice of Cancellation

U. S. Patent Office, *Richmond, Va., Sept. 12, 1946.*

William Albert Fitzsimmons, his assigns or legal representatives, take notice:

A petition for cancellation having been filed in this Office by Anna-Jean Yuill, 1 N. La Salle St., Chicago, Ill., to effect the cancellation of trade-mark registration of William Albert Fitzsimmons, 226 W. 11th St., Newport, Ky., No. 263,008, dated October 29, 1929, and the notice of such proceeding sent by registered mail to the said Fitzsimmons at the said address having been returned by the post office undeliverable, notice is hereby given that unless said Fitzsimmons, his assigns or legal representatives, shall enter an appearance therein within thirty days from the first publication of this order the cancellation will be proceeded with as in the case of default. This notice will be published in the Official Gazette for three consecutive weeks.

LESLIE FRAZER,
First Assistant Commissioner.

Condition of Applications Under Examination at Close of Business September 13, 1946

(Total number of applications awaiting action, excluding Trade-Mark Division, 123,433; Trade-Mark Division, 10,385. Oldest new case, March 31, 1945; oldest amended, March 21, 1945.)
(The dates given are 1945 except where † indicates 1946.)

Divisions, Examiners, and Subjects of Inventions	Oldest new application awaiting office action	Oldest amended application awaiting office action	No. of applications awaiting action
1. GOLDBERG, A. J., Food Apparatus; Closure Operators; Fences; Gates; Planters; Plows; Harrows and Diggers; Plant Husbandry; Scattering Unloaders; Baths, Closets, Sinks, and Spittoons; Sewerage.	May 12	June 25	2261
2. HERRMANN, D., Fishing, Trapping and Vermin Destroying; Bee Culture; Dairy; Animal Husbandry; Presses; Tobacco; Textile Wringers; Butchering.	June 1	June 5	2716
3. SCHIMMEL, J., Metal Founding; Metallurgy; Metal Treatment; Compositions (part)	May 23	May 19	1932
4. BISHOP, WALTER C., Conveyors; Hoists; Handling Apparatus; Excavating; Elevators; Fire Escapes; Ladders; Scaffolds; Package and Article Carriers; Pneumatic Dispatch; Store Service; Mining, Quarrying and Ice Harvesting.	Aug. 2	Aug. 24	2187
5. ROBINSON, C. W., Glass; Harvesters; Music; Acoustics; Sound Recording; Knotters; Buckles, Buttons, Clasps.	Apr. 12	May 1	3451
6. GENIESSE, E. W., Carbon Chemistry (part)	Oct. 10	Oct. 16	1694
7. JARBOE, C. G., Optics, Photography	June 30	Oct. 16	2009
8. IMUS, A. E., Furniture; Kitchen and Table Articles; Racks and Cabinets	July 18	July 26	2941
9. BENSON, R. B., Pumps and Fans; Fluid and Fluid-Current Motors	Apr. 18	Apr. 19	2031
10. ANDRUS, L. M., Radiant Energy (part, e. g., Portable Radio Sets, Radio Accessories, Detectors, Oscillation Generators, Wave Meters, Tuners); Modulators.	July 21	July 14	1491
11. BENHAM, E. V., Boots, Shoes, and Leggings; Button, Eyelet, and Rivet Setting; Harness; Leather Manufactures; Nailing and Stapling; Whip Apparatus.	Nov. 16	Feb. 15	662
12. SPINTMAN, S., Machine Elements (part); Engine Starters; Clutches and Power Stop Control	June 6	June 21	2406
13. BEALL, T. E., Gear Cutting, Milling, Planing, Metal Working (part); Needle and Pin Making; Turning	June 13	June 28	1955
14. HANLIN, GEORGE, Metal Working (Bending; Sheet-Metal; Wire; Misc. Processes); Wire Fabrics; Farriery	Sept. 25	Sept. 21	1382
15. HENKIN, B., Natural Resins, Rubber (part); Proteins, Carbohydrates and Derivatives; Heterocyclic Compounds (part); Plastics.	May 25	Aug. 12	1209
16. LOVEWELL, N. N., Telegraphy; Telephony	Aug. 24	Aug. 19	1193
17. HABECKER, LEON B., Paper Manufactures; Printing; Type Casting; Sheet Material Associating or Folding; Sheet or Web Feeding; Type Setting.	Apr. 10	Mar. 21	1103
18. KURZ, J. A., Motors, Expansible-Chamber Type; Power Plants; Speed Responsive Devices; Rotary Internal Combustion Engines.	June 29	July 6	1716
19. PATRICK, P. L., Liquid and Gaseous Fuel Burners; Stoves and Furnaces	Sept. 30	Sept. 29	1545
20. BROWN L. M., Miscellaneous Hardware; Closure Fasteners; Locks; Undertaking; Bread, Pastry, and Confection Making; Laminated Fabrics (part); Bank Protection; Safes.	June 9	June 9	1754
21. THOMPSON, T. J., Textiles	Nov. 1	Jan. 16	733
22. CARPENTER, B. H., Aeronautics; Firearms; Ordnance	Aug. 27	June 29	1803
23. LEWIS, J. B., Cash Registers; Calculators (part)	June 11	July 27	234
24. LUSBY, CHARLES, Apparel; Apparel Apparatus; Sewing Machines	Jan. 14	Jan. 8	1075
25. BLAKELY, C. F., Classifying Solids; Centrifugal-Bowl Separators; Mills; Threshing; Vegetable and Meat Cutters and Comminutors; Distillation.	July 14	Aug. 9	1463
26. YOUNG, R. R., Electricity—Generation and Motive Power	June 20	June 14	1806
27. CLARK, W. N., Brush, Broom, and Mop Making; Brushing, Scrubbing and General Cleaning; Cleaning and Liquid Contact with Solids; Textiles, Fluid Treating Apparatus; Ironing; Washing Apparatus.	May 31	June 5	1910
28. SOLYOM, H. L., Heating; Metallurgical Apparatus; Internal-Combustion Engines (part); Cylinders; Pistons	May 24	Apr. 3	1349
29. SHKLARIN, J. B., Baggage; Cloth, Leather, and Rubber Receptacles; Button Making; Woodworking; Tools	July 9	June 30	2061
30. BISHOFF, A., Automatic Temperature and Humidity Regulation; Illumination; Thermostats and Humidostats; Heating Systems; Ammunition and Explosive Devices.	July 9	July 16	2216
31. DUNCOMBE, C. S., Hydrocarbons; Mineral Oils	Feb. 27	Feb. 27	935
32. LESH, KARL R., Gas and Liquid Contact Apparatus; Heat Exchange; Gas Separation; Agitating; Wells; Earth Boring.	Sept. 5	Sept. 7	1886
33. KAUFFMAN, H. E., Bridges; Hydraulic and Earth Engineering; Building Structures; Roads and Pavements; Plastic Block and Earthenware Apparatus.	July 27	July 25	2679
34. SAPERSTEIN, S., Electricity—Transmission to Vehicles; Railways; Track Sanders; Signals and Indicators	Aug. 17	Sept. 15	1146
35. BROMLEY, E. D., Card and Sign Exhibiting; Dispensing; Filling and Closing Portable Receptacles; Ammunition and Explosive Charge Making.	July 18	Sept. 6	1794
36. McFADYEN, A. D., Automatic Weighers; Measuring and Testing; Force Measuring	June 6	June 6	1546
37. WEAVER, M. E., Electricity, Circuit Makers and Breakers	July 14	May 3	1320
38. KRAFFT, C. F., Coating Processes; Coating or Plastic Compositions (part); Rubber (part); Ornamentation	Aug. 9	Aug. 18	1227
39. WHITNEY, F. I., Fluid-Pressure Regulators; Valves; Water Distribution	May 1	May 1	2311
40. DRUMMOND, E. J., Receptacles (part); Packages	Aug. 10	Oct. 2	2265
41. HERTZ, M., Coin Handling; Recorders; Deposit Receptacles; Counters and Calculators (part); Typewriting Machines; Check-Controlled Apparatus.	Apr. 24	July 3	832
42. MARANS, H., Electric Signaling; Electricity, Galvanometers and Meters	Sept. 27	Sept. 21	955

DECISIONS IN PATENT AND TRADE-MARK CASES

U. S. Court of Appeals for the District of Columbia

International Standard Electric Corporation

v.

Ooms, Commissioner of Patents

Nos. 9,111, 9,112 and 9,113. Decided June 28, 1946

[— F.(2d) —; 70 USPQ 32]

1. Application—Disclosure—Evidence.

Where a witness stated positively that a person skilled in the automatic-telephone art and not also in the calculating-machine art could make calculating devices from the disclosures of appellant's applications, but that witness was an automatic-telephone expert who had substantial experience in the calculating-machine art, was associated with the development of appellant's device long before the applications were prepared, and was employed by a corporation affiliated with appellant, *Held* that the district court was under no obligation to accept his untested opinion as conclusive, and that the record supported the court's finding that the ability of automatic-telephone men to use the disclosures was not established.

2. Same—Same—Section 4888 R. S. — "Art."

In construing the reference in section 4888 R. S. to "art" *Held* that ordinary usage contradicts the assumption that the "art" to which an invention pertains must depend upon similarity of ends and cannot depend upon similarity of means, methods, or techniques.

3. Same—Same—Same—"Science."

In weighing the word "science" in the statutory phrase "the art or science," *Held* that "In ordinary thought, one science is differentiated from another quite as much by special knowledge and techniques as by special intentions and results."

4. Same—Same—Same—"The Art or Science."

Held that unless the purpose of the patent law requires a narrower construction, the phrase "the art or science," as used in section 4888 R. S., is broad enough to connote processes as well as products, and that the reasons for the statutory requirement of disclosure do not suggest that Congress intended "the art or science" to be determined, contrary to ordinary usage, by reference to products or results alone.

5. Same—Same—Same.

"The present question of law comes to this. When a technique previously used for one purpose (the construction of automatic-telephone equipment) is applied to a second purpose (the construction of calculating equipment), must the innovator describe the technique so that it can be used by men who know nothing about it but are skilled in applying different techniques to the second purpose? Such a description may not be possible and, we think, is not required."

6. Same—Same—Same.

"We think 'the art or science to which [an invention] appertains, or with which it is most nearly connected' is the most relevant art or science, i. e., the one whose adepts have the best chance of being 'enable[d] . . . to make, construct, compound, and use' the invention."

7. Appeal—Remand.

"Though appellant did not, in the district court, discharge its burden of proving that a man skilled in the most relevant art or science could build appellant's devices from the disclosures, we think the ends of justice will be best served by remanding the case to the district court with instructions to hold it until the Patent Office decides whether in its opinion that is the case."

Appeals from the District Court of the United States for the District of Columbia. Remanded.

Mr. Paul Kolisch (*Mr. Ralph B. Stewart* of counsel) for International Standard Electric Corporation.

Mr. W. W. Cochran (*Mr. E. L. Reynolds* of counsel) for the Commissioner of Patents.

Before Edgerton, Wilbur K. Miller, and Prettyman, *Associate Justices*.

Edgerton, *J.*:

These appeals are from judgments of the district court dismissing complaints under R. S. § 4915, 35 U. S. C. § 63, to obtain patents. The Patent Office and district court have held that the disclosures (descriptions) in appellant's applications are not sufficient. The statute provides that "Before any inventor or discoverer shall receive a patent for his invention or discovery he . . . shall file in the Patent Office a written description of the same, and of the manner and process of making, constructing, compounding, and using it, in such full, clear, concise, and exact terms as to enable any person skilled in the art or science to which it appertains, or with which it is mostly nearly connected, to make, construct, compound, and use the same . . ."[1]

The alleged inventions are calculating devices. They are not composed of usual calculating-machine parts, but of relays, switches and other parts which, in the words of the applications, are "of types used widely in telephone exchange systems," viz. automatic-telephone systems. A Patent Office Examiner, expert in the calculating-machine art but not in the automatic-telephone art, could not make head or tail of the descriptions. He thought they were therefore insufficient. The Board of Appeals of the Patent Office agreed with him. It left undecided, as immaterial, the question whether the descriptions would enable an automatic-telephone man to make and use the inventions.

[1] The district court found that the inventions "appertain" to the calculating-machine art and are not "most nearly connected" with the automatic-telephone art; that the disclosures would not enable persons skilled in the calculating-machine art to make and use the inventions; and that it had "not been established" that they would enable persons skilled in the automatic-telephone art to make and use the inventions. There was no evidence that any person skilled in the automatic-telephone art and not also in the calculating-machine art had ever shown, or said, that he could make the devices from the disclosures. Though a witness stated positively that such a person could do so, the court was under no obligation to accept this untested opinion as conclusive. The witness was an automatic-telephone expert who had substantial experience in the calculating-machine art; he was associated with the

[1] R. S. § 4888, 35 U. S. C. § 33.

development of appellant's device long before the applications were prepared; and he was employed by a corporation affiliated with appellant.[2] Accordingly the record supports the court's finding that the ability of automatic-telephone men to use the disclosures was not established.

[2][3][4] Appellant contends that an automatic-telephone man could use the disclosures and that they are therefore sufficient. The Commissioner's theory, on the other hand, is that a device the purpose of which is calculation or computation necessarily "appertains to" the calculating-machine art and cannot be "most nearly connected with" any other art. This theory apparently rests on the assumption that the "art" to which an invention pertains must depend upon similarity of ends and cannot depend upon similarity of means, methods, or techniques. Ordinary usage contradicts this assumption. The Century Dictionary has among its definitions of art "1. . . . the employment of given means to effect a purpose . . . 4. A system of rules and traditional methods for facilitating the performance of certain actions." The Oxford Dictionary has among its definitions "I. Skill; its display or application . . . II. Anything wherein skill may be attained or displayed." All this suggests means quite as much as ends. Moreover, the Commissioner's theory regarding "art" ignores the word "science" in the statutory phrase "the art or science." In ordinary thought, one science is differentiated from another quite as much by special knowledge and techniques as by special intentions and results. Unless the purpose of the patent law requires a narrower construction, the phrase "the art or science" is broad enough to connote processes as well as products.

"The limits of a patent must be known for the protection of the patentee, the encouragement of the inventive genius of others and the assurance that the subject of the patent will be dedicated ultimately to the public."[3] These reasons for the statutory requirement of disclosure do not suggest that Congress intended "the art or science" to be determined, contrary to ordinary usage, by reference to products or results alone.

[5][6] The present question of law comes to this. When a technique previously used for one purpose (the construction of automatic-telephone equipment) is applied to a second purpose (the construction of calculating equipment), must the innovator describe the technique so that it can be used by men who know nothing about it but are skilled in applying different techniques to the second purpose? Such a description may not be possible and, we think, is not required. "The specification of a patent is not addressed to people who are ignorant about the subject-matter. It is addressed to people who know something about it."[4] We cannot reconcile the Commissioner's theory with that principle. If his theory is correct, the invention of the steamboat involved nothing patentable. No description of the mechanism of a steamboat would be likely to enable an ordinary skilled builder of sail-boats or row-boats to make it, and if, as appellee's present theory implies, the only "art" concerned was the making of boats, a description which taught builders of stationary engines to make the mechanism of a steamboat was not sufficient. We think "the art or science to which [an invention] appertains, or with which it is most nearly connected" is the most relevant art or science, i. e., the one whose adepts have the best chance of being "enable[d] . . . to make, construct, compound, and use" the invention.

[7] Though appellant did not, in the district court, discharge its burden of proving that a man skilled in the most relevant art or science could build appellant's devices from the disclosures, we think the ends of justice will be best served by remanding the case to the district court with instructions to hold it until the Patent Office decides whether in its opinion that is the case.[5]

So ordered.

U. S. Court of Customs and Patent Appeals

VITAL FOODS CORPORATION
v.
MILES LABORATORIES, INC.

No. 5,150. Decided June 11, 1946

[— F.(2d) —; 70 USPQ 191]

1. TRADE-MARKS—CONFUSING SIMILARITY.
Upon consideration of the question of confusing similarity between appellant's mark "VitaMight," in which the letters V and M are capitalized and printed in boldface type, and the remaining letters are printed in small type, and appellee's registered trade-mark "Vitamiles," in which the letters are all capital in form, uniform in size, and plain in character, *Held* that there is "a certain difference in the appearance of the marks when compared side by side, but a mere difference in appearance is not of itself controlling"; and *Held* that the alleged difference in the significance of the words of the marks is not controlling.

2. SAME—SAME—DOMINANT PORTION.
In the marks "Vitamiles" and "VitaMight," "miles" and "Might" *Held* to constitute the dominant features.

3. SAME—SAME.
The mark "VitaMight," applied to a concentrate of essential vitamins and minerals, *Held* confusingly similar to the registered trade-mark "Vitamiles," applied to vitamin tablets.

APPEAL from the Patent Office. Affirmed.

Mr. Earle D. Crammond and *Mr. Almon S. Nelson* for Vital Foods Corporation.

Mr. Edward S. Rogers, *Mr. William T. Woodson*, *Mr. James H. Rogers*, and *Mr. Thomas L. Mead, Jr.*, for Miles Laboratories, Inc.

GARRETT, *P. J.*:

This is an appeal from the decision of the Commissioner of Patents (speaking through the Assistant Commissioner), 63 USPQ 303, affirming the decision of the Examiner of Trade-Mark Interferences sustaining the opposition of appellee to appellant's application for registration of the word "VitaMight," arranged in somewhat fanciful form, as a trade-mark for use on a concentrate of essential vitamins and minerals, the opposition being based upon appellee's alleged prior use and registration of the term "Vitamiles" for vitamin tablets.

The reasons of appeal before us raise no question as to the goods of the respective parties being of the same descriptive properties, nor does the brief for appellant suggest that they are not of the same descriptive properties. Appellant rests its case upon the difference between the marks, and the issue for our determination is narrowed to consideration of the resemblance of the marks.

The Trade-Mark Registration Act of February 20, 1905, under which appellant seeks the registration directs, inter alia, that "trade-marks * * * which so nearly resemble a registered or known trade-mark owned and in use by another and appropriated to merchandise of the same descriptive properties as to be likely to cause confusion or mistake in the mind of the public or to deceive purchasers shall not be registered" (Sec. 5 U. S. C., Title 15, § 85 (b)).

Considerable testimony was taken on behalf of appellant, but it is of no practical aid in passing upon the question of resemblance, the only issue here involved. The marks speak for themselves.

As has been stated, appellant's mark is arranged in somewhat fanciful form, the V and M being capitalized and printed in bold-faced type, and the remaining letters in small type. The petition for registration states that the drawing is lined to indicate red color. The specimens showing the mark as actually used, as they appear in the record before us, however, are black. We take it to have been anticipated that the term would become known in the trade as the name of the goods and that purchasers usually would call for the concentrate by that name—VitaMight. In the mark of appellee the letters are all capital in form, uniform in size, and plain in character. As in the case of appellant's product it is assumed that the mark is known in the trade as the name of the goods and that purchasers usually call for the tablets by the name—Vitamiles.

[1][2][3] Because of the fanciful form of appellant's letters there is, of course, a certain difference in the appearance of the marks when compared side by side, but a mere difference in appearance is not of itself controlling.

It is noted that both marks are composed of two words, the first word in each being identical as are the first two letters of the second word. Neither mark is hyphenated. When pronounced, there is obviously much similarity in sound.

Appellant contends, however, that there is a difference in the significance of the words "miles" and "Might"; that "miles" stems from appellee's corporate name while "Might" is suggestive of strengthening the body by use of the concentrates (which are in tablet form), and in this connection places great emphasis upon our decision in the case of *Miles Laboratories, Inc.*, v. *Foley & Company*, 32 C. C. P. A. (Patents) 714, 144 F.(2d) 888, 63 USPQ 64, 569 O. G. 359, wherein we held "Vitamiles" and "Vitabuild" not to be confusingly similar.

In the course of our decision there we said:

> We do not think that either party to this controversy could successfully contend that it is entitled to preempt the field with respect to marks having "Vita" as a portion thereof, and thus exclude all others from the use of any mark composed in part of that term, and it seems to us that "miles" and "build," in fact, constitute the dominant features of the marks before us. It further seems to us that the complete marks, when the significance of each is properly considered, are distinctive in character and that confusion is not likely to result from their concurrent use on similar goods.

We adhere, of course, to the view that Miles Laboratories, Inc., is not entitled to preempt the field with respect to marks having "Vita" as a portion thereof, for the reasons fully stated in our decision in that case, and in the instant case we think "miles" and "Might" in fact constitute the dominant features of the marks before us.

We think, however, that there is no such distinction between these dominant features, as existed with respect to "miles" and "build" in the cited case. Nor do we think the alleged difference in the significance of the words of the marks is controlling.

The question of priority of use is not here involved.

We feel constrained to agree with the view of the Commissioner to the effect that confusion and mistake in the mind of the public and deception of purchasers as to origin would be likely to result from concurrent use of the marks on the goods of the respective parties. We think the Commissioner was correct in the statement that "Whatever trade-mark significance the parts "Vita" carried would only increase the likelihood of confusion."

The decision of the Commissioner is affirmed.

Affirmed.

U. S. Court of Customs and Patent Appeals

IN RE FREED

No. 5,168. Decided June 11, 1946

[— F.(2d) —; 70 USPQ 206]

PATENTABILITY—CATALYTIC COMPOSITION.
Certain claims to a catalytically active composition in the form of flakes and to the method of preparing such a composition *Held* unpatentable over the prior art.

APPEAL from the Patent Office. Affirmed.

Mr. A. A. Orlinger for Freed.

Mr. W. W. Cochran for the Commissioner of Patents.

BLAND, *J.*:

Owing to the number of claims and the size of the record and briefs, the issues in this case at first

appear quite formidable, but upon closer approach the real issue determinative of the appeal is not an involved one.

The Primary Examiner of the United States Patent Office rejected all of appellant's claims, 1 to 18, inclusive, in an application for a patent entitled "Catalytic Compositions." Upon appeal to the Board of Appeals claim 18 was allowed and it was indicated that claims 1, 6 and 9 could be allowed over the cited prior art references if "*uniformly* were inserted before 'dispersed'" at certain places in the claims.

From the Board's decision affirming that of the Examiner in rejecting claims 1 to 17, inclusive, appellant has here appealed.

In this court, appellant, "to reduce the issue and expedite consideration of the appeal," moves to withdraw the appeal as to product claims 2 and 3, and process claims 12, 13, and 15, "as if they were cancelled without prejudice." Appellant's motion to withdraw, being considered as a motion to dismiss as to the claims enumerated, will be granted. This leaves for consideration article claims 1, and 4 to 11, inclusive, and method claims 14, 16 and 17.

Of the appealed claims, claim 1 and claim 14 are regarded as representative and follow:

1. A catalytically active composition in the form of flakes comprising a catalytically active inorganic constituent deleteriously affected by the air dispersed in a solidified oleaginous substance as a protective medium.

14. In the method of preparing a solid catalytically active composition in flake form with the ingredients thereof dispersed ther in in homogeneous character, comprising nickel in catalytically active state dispersed in a solidified oil of vegetal origin, the step which comprises distributing over a chilled surface a layer of a liquid suspension comprising said nickel in catalytically active state homogeneously dispersed in said oil in liquid state, to harden the composition.

We think the claimed invention is briefly but best described in the brief of the Solicitor for the Patent Office and we quote:

The application relates to a catalyst to be used in the hyodrogenation of vegetable or animal oils.

Vegetable oils, such as cotton-seed oil, are liquid at ordinary temperatures and are suitable for use in cooking but are not considered as desirable as a white solid product having the appearance of lard. Cotton-seed oil may be converted into such a white solid product by adding hydrogen to it under heat and pressure. This is how "Crisco" is made. In order, however, for the hydrogen to enter into combination with the oil it is necessary that a catalyst be present. This catalyst is usually finely divided nickel. But finely divided nickel, unless protected from the air, will become oxidized and useless as a catalyst. To provide this protection of the nickel it is customary in the art to disperse the nickel in an oil. [Appellant's application so states.] Appellant uses a hydrogenated vegetable or animal oil for this purpose, which oil is solid at ordinary temperatures. All this is recognized by appellant to be old. Appellant states in his specification that it is customary to put up this catalytic material for shipment by running the hot liquid dispersion of nickel into steel drums in which it cools and solidifies. An alleged disadvantage in this procedure is that the particles of nickel being heavier than the oil will settle to some extent toward the bottom of the drum before the oil solidifies with the result that the concentration of nickel at various levels in the drum will vary. As a consequence it is necessary for those who use this material to take samples from various portions of the material in the drum and analyze them to determine the actual nickel content.

To remove this difficulty, appellant stirs the hot liquid continuously to maintain it homogeneous as to nickel content and distributes it continuously in a rather thin film over a chilled drum. The liquid is thus quickly solidified. Following this the material is scraped from the drum to form flakes. In such form the material may be conveniently shipped in bags or fiber containers.

Two advantages residing in this product are apparent. First, the product may be shipped and used more conveniently than the solid mass contained in a 50-gallon drum. Second, the product is uniform in composition.

The Examiner rejected certain of the appealed claims upon the following references: Ellis, 1,329,322, January 27, 1920; Boertlein, 1,740,084, December 17, 1929; and in discussing the application of the references to the claims stated in part:

Claims 1 through 6 and 9 are rejected as unpatentable over Ellis. The flaked product of these claims differs only in degree, if at all, from the "rough fragments" of the patent. In this connection, it has been argued that the art shows only *large* fragments or *large* blocks of nickel-containing solid oils, fats, waxes, etc. However, the term *"large"* has been read into the references by the applicant. At any rate the claimed flaked product differs from *larger rough fragments* only in size and this is not considered of patentable significance. It should be noted that applicant breaks the hardened layer of material into "fragments" without further limitation in claim 15. Furthermore the size of the flakes is not limited in the claims.

The applicant points out the "tremendous" advantage of the flaked product over the prior art in the feasibility of shipping it to the point of use. However, no advantage over the "rough fragments" of the Ellis reference can be seen, since Ellis' product is not fusible at ordinary temperatures and "can be shipped in ordinary cloth bags or slack cooperage." In the specification and later, in the prosecution of the application, the applicant has failed to recognize this aspect of the prior art.

The product claims, i. e., claims 1 through 6 and 9 are also rejected as unpatentable over Ellis taken in view of Boertlein. This patent discloses the flaking of soap, which is a saponified fat or oil. This ties in pretty well with Ellis in which there is a disclosure of saponifying the oil being treated to make soap thereof. Note lines 90 to 102 on page 4 of Ellis. Noting the disclosure on this same page, lines 109 to 116, it is obvious that the some of the colloidal nickel remains in the hydrogenated product since there is an input of 40 pounds of nickel and only 38 pounds are recovered. If this hydrogenated product containing a small amount of nickel be saponified as suggested by Ellis (converted into soap) and then flaked as suggested by Boertlein, applicant's product and process would be produced. The product (and process) also seems uninventive when viewed in this light.

Claims 12 through 18 are rejected as unpatentable over Ellis taken in view of Boertlein. The claims merely recite the flaking steps of Boertlein applied to the catalytic mixtures of Ellis. Ellis provides a *stirrer* to insure the homogeneous character of his product which characteristic is recognized as highly desirable in the art. It is well recognized that a given quantity of material must contain a definite amount of nickel in order to enable the operator to accurately measure the desired amount of the nickel to be added to a batch of oil to be hydrogenated. Note the percentages of nickel in Ellis' product, page 3, paragraph 2, for instance. Hence, it appears obvious that no new problem is encountered and no new process steps are involved in flaking Ellis' composition by Boertlein's process. No adaptation is necessary in conveying Ellis' nickel-containing oil or paraffin wax to Boertlein's flaking apparatus, since Ellis' product is homogeneous at the end of the reduction step due to the action of his stirring apparatus. [Italics quoted.]

It will be noted that of the claims we are here considering claims 1, 4, 5, 6 and 9 were rejected as unpatentable over the patent to Ellis, and they were also rejected as unpatentable over Ellis in view of Boertlein. We will consider these claims first.

The Ellis patent is directed to a new and useful improvement in making powdered metals and reduced metallic compounds and the article so produced. He was concerned with producing a catalytic material, such as nickel which is involved in the instant case, in finely divided form for use in the hydrogenation of fatty oils. He, for the same purposes as those proposed by appellant, suggested concentrating from 20 to 25%, or, in some instances, 60 to 80%, of nickel in oil and then allowing the molten mixture to settle or be centrifuged. The concentrate is then separated from the remainder of the wax.

While Ellis' product may be put up in drums in which the oil and nickel particles would be intermixed, it is obvious a settlement of the heavier particles might result. He also states in his patent the following:

• • • Also it has been proposed to heat organic salts of nickel in an oil vehicle to bring about the formation of finely divided nickel.

Further along he recites that:

Further as noted, paraffin wax or similar mineral wax is well suited as a medium in which the catalyzer is formed and the use of a hard brittle wax free from oleaginous material including freedom from fatty material reactive with nickel on standing (thus changing the physical structure of the catalyzer) affords a product which can be shipped in ordinary cloth bags or slack cooperage. No expensive shipping container is required. The catalyzer may be shipped *in the form of cakes or rough fragments* which for use are simply added to the oil to be hardened or if desired may be melted in a separate container with some oil and pumped to the point of use. By employing a hard wax so that the fragments do not fuse together in shipping, the product is more readily handled for some purposes. [Italics added.]

It is true that Ellis does not state the method in which the liquid is flowed over a chilled surface to cool and solidify it, nor does he explain just how the catalyzer is reduced to the form of cakes or rough fragments, but the Boertlein patent shows how molten liquid is placed in a pan over which a rotating drum operates and the liquid is chilled by water circulating through this drum. The liquid film carried up on the drum solidifies and is scraped off in flakes by a scraper. To aid in the cooling of the film, Boertlein provides means for blowing a current of air against it. This feature is not shown in the present application.

Boertlein is concerned with producing solid materials in the form of flakes, and he was particularly concerned, though not so limited, with flaking such materials as soap. There is nothing new or novel about flaking liquid materials which solidify upon being cooled. One of the most common expedients today in the making of numerous articles, including soap, is to reduce it to flakes. This is done with the purpose of making them more suitable for shipment and readily usable, which is the purpose for which appellant flakes his material. Boertlein states that:

The flaked product possesses the advantages of being homogeneous in composition and, because of its physical form (being in the form of thin, flat pieces of laminae), of presenting a large surface to the action of a solvent. It is easy to handle, and can be readily packaged and removed from containers.

The Board, in affirming the elaborate decision of the Examiner (except as to claim 18, which it allowed), in part said:

Applicant describes his flake product as fairly uniform in thickness, the flake production in individual batches being regularly homogeneous.

Ellis does not show the flake form of the product but the form per se is obvious from Boertlein. Claims 1 to 6 and 9 do not state that the nickel is uniformly distributed in the flake as stated in line 26, page 5 of the specification.

Applicant's process is described at the top of page 5 of the specification but as stated in claims 12 to 17, the process involves not much more than pouring the Ellis molten mixture into a cold barrel. The step of breaking the cold mass into fragments or flakes does not distinguish from Ellis in an inventive sense.

• • • • • • •

Claims 1, 6 and 9 could be allowed over the cited art if *uniformly* were inserted before "dispersed" in line 3, claim 1 and line 2, claim 6. [Italics quoted.]

Applicant contends that the references do not remotely suggest applicant's concept. The same appears to be true of applicant's claims, except claim 18.

The patents submitted with the brief for various forms of phthalic anhydride, including a patent on the flaked form, are not persuasive that we should allow the present rejected claims. Applicant's invention is not in the form but in the uniform distribution of nickel in the flaked form.

The decision of the Examiner is reversed as to claim 18 and is affirmed as to the remaining claims on appeal.

In the absence of pertinent art claims 1, 6 and 9 are considered allowable when amended as suggested.

Upon petition for reconsideration, appellant contended that if claims 1, 6 and 9, when amended to include the word "uniformly" as before stated, and claim 18 were allowable, the Board should also allow claims 12 to 17 for the same reasons as claim 18. The Board undertook to distinguish these claims from claim 18 and we are not sure that they have satisfactorily done so, but in any event we are not privileged to consider the Board's allowance of claims in determining whether appealed claims are patentable. The authorities are so numerous on this question as to not require citation here.

Appellant, after having fully discussed the questions involved in a petition for reconsideration before the Board, has filed two elaborate briefs here and urges, among many other contentions, that his process and article differ from the disclosures of the prior art in that (1) by agitation while cooling he uniformly disperses the nickel particles throughout the solidifying oil; (2) there is no cited prior art disclosing the flaking of materials of this character or any material similar thereto which contains heavier mineral particles, such as nickel. Appellant argues that Boertlein, in flaking his material, was not confronted with the problem of flaking a material containing heavy mineral particles and urges that the composition disclosed in the Boertlein patent did not contain any inorganic solids and that, contrary to the contention of the Solicitor, the soap with which Boertlein was concerned was a single, individual substance not having "any of the distinct constitutional characteristics of the composition appellant used."

Appellant urges that Boertlein's material is a "non-heterogeneous material" and "consists of a single, individual substance." The Solicitor urges that it is more than one substance, and while we think that soap is composed of more than one substance it is obvious that ordinary soap is not composed of substances of such divergent characteristics with respect to settling as is the material of appellant. However, we think this fact is immaterial because one who knew how to flake the Boertlein material would certainly know how to flake appellant's material. The importance of flaking, for all purposes stated, was generally known in the art.

So to recapitulate, we agree with the tribunals below that "agitation while cooling" in the manner described by appellant for the purpose of getting a homogeneous mass into more solid form does not

amount to invention, nor is it inventive to flake a product as appellant has done.

It may be that appellant's process and procedure will expedite the handling of a catalytic material of this character, but we think everything appellant has done which is defined by the appealed claims, in view of the prior art, is within the skill of such art.

As to whether or not the addition of the word "uniformly" as applied to the homogeneous character of the distribution of the nickel in the oil lends patentability to certain claims, we are not here called upon to determine.

In view of the foregoing, we conclude that the Board properly affirmed the action of the Examiner in rejecting the claims here on appeal and its decision so doing is affirmed. As to claims 2, 3, 12, 13 and 15, the appeal is dismissed.

Affirmed.

U. S. Court of Customs and Patent Appeals

IN RE PHILLIPS

No. 5,184. Decided June 11, 1946

[— F.(2d) —; 70 USPQ 217]

PATENTABILITY—PISTON RING.

Claims to a piston ring *Held* unpatentable over the prior art.

APPEAL from the Patent Office. Affirmed.

Messrs. Earl & Chappell (*Mr. Otis A. Earl* and *Mr. Munson H. Lane* of counsel) for Phillips.

Mr. W. W. Cochran (*Mr. E. L. Reynolds* of counsel) for the Commissioner of Patents.

BLAND, *J.*:

This appeal from the decision of the Board of Appeals of the United States Patent Office involves an alleged improvement relating to piston rings. Appellant's device is described by the Examiner as follows:

> The application discloses a three part piston ring comprising two thin cylinder contacting rings and an expander element. Each cylinder contacting ring has an axial extending shoulder formed by an offset circumferentially of the ring. The expander element is the well known polygonal ribbon steel type which reacts from the bottom of the groove. When assembled, the cylinder contacting rings are positioned in the groove with offset portions facing each other. The expander is placed between the groove bottom and shoulders or offset portions. In this position, the expander serves a double purpose. It expands the ring elements by reaction between the groove bottom and the ring shoulders and axially spaces and maintains the ring elements by extending between them to the shoulder. The expander element has the usual cutaway portions in the edge to improve the oil flow.

The appeal claims, 1, 2 and 3 (and they all stand or fall together), were rejected by the Primary Examiner upon the following references: Malpas, 2,229,578, January 21, 1941; Phillips, 2,113,857, April 12, 1938; Teetor, 2,236,721, April 1, 1941; and his decision was affirmed by the Board for the same reasons as those expressed by the Examiner.

Claim 1 is illustrative and follows:

> 1. A piston ring assembly comprising a pair of axially spaced, thin split annular cylinder wall engaging members formed of ribbon-like ductile material, said members being disposed in parallel relation and having the outer portions thereof parallel and axially offset sharply toward one another to define abrupt annular shoulders providing opposite inwardly facing cylindrical axially extending spring abutments located substantially midway between the outer and inner peripheries of the members, an annular split expanding spring crimped at spaced intervals along the length thereof and of ductile metal disposed between said members with the crimps of the spring in axial spacing engagement therewith and in radial expanding engagement with the said annular abutments, said spring having connecting reaches of substantial length connecting said crimps, said reaches having intermediate portions for engaging the bottom of a piston ring groove, said intermediate portions supportingly engageable under substantial compression with the bottom of the piston groove in which the assembly is installed, said crimps of said expanding spring being without axial curvature, whereby said spring exerts a radial expanding action only on said abutments derived from the compression thereof against the groove bottom in installing the assembly.

The Malpas patent, the one chiefly relied upon, in the disclosure of one of the embodiments of the invention, shows a piston ring assembly comprising upper and lower ring elements each comprising flat portions joined by an offset shoulder, and an intermediate spring member, bearing against the shoulders and serving to expand the ring elements radially. The spring member, as disclosed, apparently does not bear against the bottom of the piston groove.

The Phillips patent, the inventor of which is appellant herein, shows an expansion ring substantially identical with that of the present application. The spring bears against the bottom of a piston groove and acts to expand a split ring radially. This ring, however, is not of the form described by the instant claims.

The patent to Teetor, although discussed briefly by both tribunals below, was cited for the reason that it shows a polygonal expander of substantially the same type as appellant's, which serves the same purpose served by appellant's expander element.

The Board, in approving the holding of the Examiner, had the following to say in part:

> Nothing is said in Malpas about the expanders wedging the rings apart or that * * * the inner reaches do not bear against the bottom of the ring groove.
>
> Teeter states that his spacer-expander does not exert any axial pressure against the sides of the rings and has reaches * * * which seat against the bottom of the ring groove.
>
> In our opinion it would be obvious to any skilled mechanic to sharpen the internal shoulders of the Malpas rings * * * to eliminate a wedging action if it developed that there was such a wedging action and to seat the expander against the bottom of the ring groove, if desired, as Teetor does.
>
> Further, we agree with the Examiner that no invention would be involved in using the expander of Teetor with the shouldered rings of Malpas.

The Solicitor for the Patent Office, in this court, urges that claim 1 reads, for the most part, upon the Malpas patent and that the pertinent disclosure in it relates to one of the modifications of the patent.

In applying the claim to the Malpas patent, the Solicitor points out the various limitations of the claim and where it is met by the Malpas patent, and finally, when he comes to the limitation relating to the spring portions "for engaging the bottom of a piston ring groove," he states that it only defines a function but that even if this is not the statement of a function this limitation would be insufficient to render the claims patentable in view of the references cited.

The Solicitor also points out that the limitation, "said crimps of said expanding spring being without axial curvature," is also functional and defines no structure, but submits that if it does define structure the crimps in Malpas are "without axial curvature."

These two limitations above discussed are the most important questions pressed by appellant and we have studied carefully the arguments of appellant's counsel and the references of record, and we conclude that appellant's structure as defined by the claims presents nothing inventive over the references cited by the Examiner.

Other minor questions have been raised by appellant but they are not of sufficient importance to require discussion here because even if it were conceded that there were certain differences between appellant's structure and those of the references, it is our view, as it was that of the Patent Office, that it would not amount to invention over the prior art.

For the reasons stated by the Board we conclude that its decision should be, and it is, affirmed.

Affirmed.

GARRETT, *P. J.*, sat during the arguments of this case, but because of illness took no part in its consideration or in the decision.

U. S. Court of Customs and Patent Appeals

IN RE BART

No. 5,162. Decided June 11, 1946

[— F.(2d) —; 70 USPQ 202]

PATENTABILITY—EXHAUSTED COMBINATION.

The appealed claims *Held* properly rejected as drawn to the old and exhausted combination of a fixture having a supply line, a waste line, a valve and a trap.

APPEAL from the Patent Office. Affirmed.

Mr. Frank Zugelter (*Mr. Donald A. Gardiner* of counsel) for Bart.

Mr. W. W. Cochran for the Commissioner of Patents.

JACKSON, *J.*:

This is an appeal from a decision of the Board of Appeals of the United States Patent Office affirming that of the Primary Examiner rejecting all of the claims, 1, 2, 3, and 10 to 12 inclusive, of an application for a patent on a "Safe Water Dispensing Device." The claims were rejected on the ground that they were drawn to an old and exhausted combination in view of prior art, and further rejected as unpatentable over the prior art.

The references relied upon are: Carroll, 460,557, October 6, 1891; Perkes, 578,024, March 2, 1897; Stubbe, 1,175,836, March 14, 1916; Mueller et al., 1,512,628, October 21, 1924; Woolley, 2,004,455, June 11, 1935.

Claims 1 and 10 are illustrative and read as follows:

> 1. In a device of the class described the combination of a water delivery line, a water supply line, a valve for cooperation with said supply line for controlling a flow of water from said line to said delivery line, said valve providing a drain connection for said delivery line when said valve is in an off position for preventing a flow of water from said supply line whereby said delivery line is gravitationally drained of water after each delivery of water therefrom, and means for precluding contamination of said delivery line by way of said drain connection, said means comprising a clean water trap and an air trap connected in series in said drain connection, whereby the air of said air trap will at all times physically separate the water of said trap from and against the return passage of waste fluid matter from a sewer, ground drain, sump, or the like into which the water drained from said delivery line is normally discharged.
>
> 10. In a device of the class described the combination of a water delivery line, a water supply line, a valve for cooperation with said supply line for controlling a flow of water from said line to said delivery line, said valve providing a drain connection for said delivery line when said valve is in an off position for preventing a flow of water from said supply line whereby said delivery line is gravitationally drained of water after each delivery of water therefrom, and means for precluding contamination of said delivery line by way of said drain connection, said means comprising a clean water trap for the water drained from the delivery line after each use of the fixture and an air trap connected in series with said drain connection, the lower end of said air trap being connected to a sewer line, the air of said air trap physically separating the water in said water trap from and against a return passage of waste fluid matter from said sewer line, and a vent connection to the atmosphere communicating with the lower end of said air trap.

The application relates to a water supply structure typified by an anti-freezing drinking fountain which comprises a water supply pipe, a delivery pipe through which the water is discharged for use, a valve to control the supply of water to the delivery pipe and the return of the water left in the delivery pipe to waste when the supply is cut off, and a trap operated by back pressure of the waste water and air against the entrance of contaminated water into the delivery pipe.

The patent to Mueller et al. relates to "Antifreezing Drinking Fountains," and discloses a hydrant structure, a water supply pipe, a delivery pipe which terminates in the drinking bubbler, a stop and waste valve connected to a waste line, and a water seal trap in the form of the conventional gooseneck.

The Woolley patent relates to an anti-siphonage device for water closets, frost-proof drinking fountains and the like, and shows a supply pipe, a delivery pipe, a stop and waste valve connected with a waste line, and in the waste line a trap designed to oppose back flow to the delivery pipe of water which may be contaminated.

The patent to Carroll is for a sink trap which comprises a cup-shaped outer wall within which and away from the sides and bottom thereof is another cup of the same general formation into which waste liquid flows. From the bottom of the outer cup is attached a drain pipe. The inner cup member is a liquid container, and as the waste water enters from

the bottom of the waste pipe, which is close to the lower portion of the inner cup, any excess over the capacity of that chamber may flow through openings in the top of the inner cup into the space between the two cups. In the event of back pressure through the drain pipe the air between the two cups and the waste water in the inner cup are said to prevent drain water from entering the liquid chamber.

The patents to Perkes and Stubbe disclose traps of the same character as that shown in the Carroll patent, and were cited by the Primary Examiner as showing also such type of traps to be old.

In finally rejecting the claims for the reason that they were drawn to an old and unpatentable combination of a fixture having a supply line, a waste line, a valve and a trap, the Examiner cited the patents to Woolley and Mueller et al.

The Board of Appeals in its decision, in affirming that ground of rejection, pointed out that the structures of those patents disclose a combination of a water supply line, a water delivery line, a valve for controlling flow of water from the supply to the delivery line, and drain connection from the delivery line into the trap.

It will be seen from the description herein of the structures defined in those patents that that rejection by both the Examiner and the Board is clearly correct.

The trap described in the application differs somewhat in shape from those disclosed by the prior art, but even if such difference were inventive it would be improper to grant a patent for the combination.

In our opinion the claims were properly rejected as an exhausted combination, and therefore it is not necessary to discuss the additional reasons for rejecting the claims.

The decision of the Board of Appeals is affirmed. Affirmed.

GARRETT, *P. J.*, sat during the arguments of this case, but because of illness took no part in its consideration or in the decision.

Public Law 517—79th Congress

[CHAPTER 587—2D SESSION]

[H. R. 3424]

AN ACT

To permit renewal of certain trade-mark registrations after expiry thereof, and for other purposes.

Be it enacted by the Senate and House of Representatives of the United States of America in Congress assembled, That whenever the President shall find that foreign proprietors of trade-marks registered in the United States Patent Office who are nationals of countries which accord substantially equal treatment in this respect to trade-mark proprietors who are citizens of the United States are or may have been temporarily unable to comply with the conditions and formalities prescribed with respect to renewal of such registrations by section 12 of an act to authorize the registration of trade-marks used in commerce with foreign nations or among the several States or with Indian tribes, and to protect the same, approved February 20, 1905, as amended (15 U. S. C. 92), because of the disruption or suspension of facilities essential for such compliance because of conditions growing out of World War II, he may by proclamation grant such extension of time as he may deem appropriate for the fulfillment of such conditions or formalities by such foreign proprietors: *Provided*, That the President may at any time terminate any proclamation authorized herein or any part thereof or suspend or extend its operation for such period or periods of time as in his judgment the interests of the United States may require: *Provided further*, That no such extension of time shall permit the filing of applications more than three years after the approval of this act: *And provided further*, That the benefits of this act shall not extend to nationals of any enemy country with which the United States was at war in World War II.

Approved July 17, 1946.

Public Law 690—79th Congress

[CHAPTER 910—2D SESSION]

[H. R. 5223]

AN ACT

To extend temporarily the time for filing applications for patents, for taking action in the United States Patent Office with respect thereto, for preventing proof of acts abroad with respect to the making of an invention, and for other purposes.

Be it enacted by the Senate and House of Representatives of the United States of America in Congress assembled, That the rights of priority provided by section 4887 of the Revised Statutes (U. S. C., title 35, sec. 32), as amended, for the filing of applications for patent for inventions, discoveries, and designs, which rights had not expired on the 8th day of September 1939, or which rights have arisen since the 8th day of September 1939, shall be, and the same are hereby, extended until the expiration of a period of twelve months from the passage of this act in favor of the citizens of the United States and of citizens or subjects of all countries which have extended, or which now extend or which within said period of twelve months shall extend substantially reciprocal privileges to citizens of the United States, and such extension shall apply to applications upon which patents have been granted, as well as to applications now pending or filed within the period specified herein: *Provided*, That no such extension shall apply to any patent unless a request in writing was made therefor during the pendency of the application for such patent in the United States Patent Office, or within twelve months after the passage of this act, which request must be accompanied by (1) a copy of the original foreign application, certified to by the patent office of the country in which it was filed, but if the original foreign application has been destroyed, other evidence pertaining thereto may be accepted; (2) a sworn translation of the same if it is not in the English language; and (3) if the foreign application was not made by the inventor himself, an affidavit by the applicant or patentee stating that such application was filed for his benefit or on his behalf and that such procedure is in accordance with the procedure in the foreign country: *Provided further*, That no patent granted or validated by reason of any such extension shall in any way furnish a basis of claim against the Government of the United States: *Provided further*, That such extension shall in no way abridge or otherwise affect the right of the United States, or of any person, firm, association, company, or corporation, who, before the passage of this act was bona fide in possession of any rights in or under patents or applications for patents conflicting with rights in patents granted or validated by reason of such extensions to exercise such rights by itself or himself personally, or by such agents, or licensees as derived their rights from it or him before the passage of this act, to the extent that they shall not be amenable to any action for infringement of any patent granted or validated by reason of such extension.

A patent shall not be refused on an application coming within the provisions of this section, nor shall a patent granted on such application be held invalid, by reason of the invention having been patented or described in any printed publication or in public use or on sale in the United States more than one year prior to the filing of the application in the United States, unless such patent or publication or such public use or sale was prior to the filing of the foreign application upon which the right of priority is based.

SEC. 2. Whenever, prior to the 8th day of April 1946, an invention, discovery, or a design has been communicated in writing or embodied in any article supplied to the Government of the United States or to any person, firm, or corporation in the United States at the request of said Government, pursuant to and by reason of an agreement or arrangement between the Government of the United States and the government of a foreign country for the supply or mutual exchange of information or articles for use for national defense purposes during the periods of the national emergencies declared by the President of the United States preceding World War II, or for use for war purposes during World War II—

(*a*) A patent based on an application filed by the inventor of the invention, discovery, or design so communicated or supplied shall not be refused or held invalid merely because of the fact that the invention, discovery, or design had been in public use or on sale in the United States, or described in a printed publication, if such public use or sale or publication was in consequence of and attributable to the communication or supply and subsequent to the date of the communication or supply; and

(*b*) For use in any action in a United States court or proceeding in the Patent Office involving a patent for an invention, discovery, or a design, or involving an application for patent for an invention, discovery, or a design so communicated or supplied any court of the United States for any district or Territory thereof, and the Commissioner of Patents shall have the power to call upon any department or agency of the Government of the United States to produce information or papers in its possession relating to the communication or supply or relating to the further communication of the invention, discovery, or design by said department or agency to any person, firm, or corporation in the United States: *Provided, however*, That the head of any department or agency may refuse and omit to comply with any call for information or papers when in his opinion such compliance would jeopardize the national defense.

No benefit under section 2 of this act shall be extended to any person unless (1) an application for patent for the same invention, discovery, or design which was communicated or supplied as aforesaid is filed in the United States Patent Office prior to the expiration of twelve months from the date of this act; and (2) unless sufficient information in writing and under oath as to what was communicated or supplied, the date thereof and to

whom made, is furnished to the Commissioner of Patents by the owner of such application while it is pending, or prior to the expiration of twelve months from the date of this act to enable him to judge of the identity of the invention so communicated or supplied with the invention claimed in such application, which information shall be made a part of the record of such application and shall have no evidentiary value as proof of the facts stated therein; and (3) unless the country of which such person is a national extends substantially reciprocal privileges to citizens of the United States.

SEC. 3. That whenever it shall be shown to the satisfaction of the Commissioner of Patents that the time now fixed by law for the payment of any fee, or for the taking of any other action, with respect to an application for patent for an invention, discovery, or design has lapsed because of conditions growing out of World War II, which time had not expired on the 8th day of September 1939, or which commenced after the 8th day of September 1939, such time may be extended by the Commissioner to a date not later than twelve months after the passage of this act, without the payment of extension fees or other penalty, in favor of citizens of the United States and the citizens or subjects of countries which have extended, now extend, or shall extend prior to the expiration of twelve months after the passage of this act substantially reciprocal privileges to citizens of the United States: *Provided*, That no extension herein shall confer such privileges upon the citizens or subjects of a foreign country for a longer term than the term during which such privileges are conferred by such foreign country upon the citizens of the United States, but nothing in this act shall give any right to reopen interference proceedings where final hearing before the Examiner of Interferences or the Board of Interference Examiners has taken place.

SEC. 4. That no patent granted or validated by reason of any extension of time provided for by sections 1 and 3 of this act shall abridge or otherwise affect the right of the United States, or of any person, firm, association, company, or corporation, or agent or agents, or his successor in business, to continue or to resume any manufacture, use, or sale bona fide commenced by it or him in the United States before the passage of this act, or, in the case of an application claiming the benefits of section 3 hereof, commenced by it or him before the taking of action or the payment of any fee under that section if such action or payment was later than the passage of this act, nor shall the further manufacture, use, or sale by it or him, or its or his agents or successors in business or the use or sale of the devices resulting from such manufacture or use constitute an infringement: *Provided*, That the benefits of this section shall not apply to the manufacture, use, or sale as aforesaid if and to the extent that it is based upon or attributable to a communication of the invention, discovery, or design so manufactured, used, or sold to the United States or to any person, firm, or corporation in the United States at the request of said Government under an agreement or arrangement between the Government of the United States and the government of another country for the supply or mutual exchange of information or articles for use for national defense purposes during the periods of the national emergencies declared by the President of the United States preceding World War II, or for use for war purposes during World War II.

SEC. 5. Notwithstanding the provisions of sections 4885 and 4887 of the Revised Statutes (U. S. C., title 35, secs. 41 and 32, respectively) no patent issued subsequent to July 17, 1945, which was scheduled for issue on that date, or on July 24, July 31, or August 7, 1945, shall be held invalid because of the deferment of the issuance of such patent due to the failure to issue patents on July 17 and July 24, 1945.

SEC. 6. Notwithstanding the provisions of the Act of Congress approved July 1, 1940 (54 Stat. 710; U. S. C., title 35, sec. 42), as amended by the act approved August 21, 1941 (55 Stat. 657; U. S. C., title 35, secs. 42*a*–42*f*), and as further amended by the act of June 16, 1942 (56 Stat. 370), no person shall be debarred from receiving a patent for an invention made in the United States, nor shall any patent issued for such invention be deemed or held invalid under said act, merely because authorization to file an application for patent for such invention in any country foreign to the United States was not first obtained from the Commissioner of Patents: *Provided*, That the Commissioner subsequently authorized the filing of the application in such foreign country.

SEC. 7. That all applications for patents for inventions, discoveries, or designs officially accepted by the Patent Office and given a serial number and date of filing since the 8th day of September 1939, and prior to the passage of this act, which were executed by an agent of the applicant, and in which a duplicate copy of the specification and a new petition and oath, all duly signed and executed by the inventor or his executor or administrator has been or shall have been filed within a period of twelve months from the approval of this act, and the patents granted on such applications, shall have the same force and effect as if the papers signed and executed by the inventor, or his executor or administrator, had been filed on the date on which the papers signed by his agent were deposited in the United States Patent Office.

SEC. 8. That all applications for patents for inventions, discoveries, or designs filed since the 8th day of September 1939, in which the oath was executed before or authenticated by a consular officer, or other representative qualified to administer oaths, of a government acting in the interest of the Government of the United States, shall have the same force and effect as if said oath had been executed by the applicant before a consular officer of the United States.

SEC. 9. That in proceedings in the Patent Office and in the courts of the United States an applicant for a patent for an invention, discovery, or a design, or a patentee, shall not be permitted to establish the date of invention or discovery by reference to knowledge or use thereof, or other activity with respect thereto, in a country foreign to the United States, other than the filing in a foreign country of an application for a patent for the same invention, discovery, or design which, in accordance with the provisions of section 4887 of the Revised Statutes, as amended, or in accordance with and subject to the provisions of this act, is entitled to have the same force and effect as it would have had if filed in the United States on the date on which it was filed in such foreign country: *Provided*, That where an invention was made by a person, civil or military, during the time such person was domiciled in the United States or its possessions and was serving in a foreign country in connection with the prosecution of the war on behalf of the United States or its allies, the inventor thereof shall be entitled, in interference and other proceedings arising in connection with such invention, to the same rights of priority with respect to such invention as if the same had been made in the United States.

SEC. 10. No patent for an invention or a discovery granted under the provisions of section 1 or 3 of this act shall extend for a longer term than twenty years from the filing date of the first application regularly filed in any country disclosing the same invention, and in no event for a period in excess of seventeen years from the date of the grant of such patent.

SEC. 11. No claims for patent infringement shall be made or action brought by or on behalf of or for the benefit of any country or a national of any country against which the United States has declared the existence of a state of war, in respect to any manufacture, use, or sale since September 8, 1939.

SEC. 12. That nothing in this act shall affect any act which has been or shall be done by virtue of the special measures taken during World War II under legislative, executive, or administrative authority of the United States in regard to the rights of any enemy, or ally of an enemy, as defined by the Trading With the Enemy Act of October 6, 1917 (40 Stat. L. 411), as amended, in patents for inventions and designs.

SEC. 13. Section 10 (*a*) of the said Trading With the Enemy Act, relating to the filing and prosecution of applications for patents and the registration of trade-marks, prints, labels, and copyrights, by an enemy, or ally of an enemy, is hereby repealed.

SEC. 14. The benefits of this act shall not extend in favor of inventions, applications, or patents made by or owned by citizens of any country with which the United States shall have been at war since the 8th day of September 1939. The Alien Property Custodian shall be entitled to the benefits of this act.

SEC. 15. Nothing contained in this act shall be effective to nullify any judicial finding upon the validity of any patent for an invention, discovery, or a design heretofore made by a court of competent jurisdiction.

SEC. 16. If any clause, sentence, paragraph, or part of this act shall be adjudged by any court of competent jurisdiction to be invalid, such judgment shall not affect, impair, or invalidate the remainder thereof, but shall be confined in its operations to the clause, sentence, paragraph, or part thereof directly involved in the controversy in which such judgment shall have been rendered.

Approved August 8, 1946.

Order No. 4094

APPLICATIONS EXECUTED AND FILED BY AGENTS

[Supplement to Order 3662, October 13, 1942]

U. S. PATENT OFFICE, *Washington 25, D. C., Sept. 9, 1946.*

1. *Legislation enacted.* Section 7 of Public Law 690, approved August 8, 1946, provides for the validation under certain conditions of agent executed applications accepted by the Patent Office under Order 3662. The section reads as follows:

"All applications for patents for inventions, discoveries, or designs officially accepted by the Patent Office and given a serial number and date of filing since the 8th day of September 1939, and prior to the passage of this act, which were executed by an agent of the applicant, and in which a duplicate copy of the specification and a new petition and oath, all duly signed and executed by the inventor or his executor or administrator has been or shall have been filed within a period of twelve months from the approval of this act, and the patents granted on such applications, shall have the same force and effect as if the papers signed and executed by the inventor, or his executor or administrator, had been filed on the date on which the papers signed by his agent were deposited in the United States Patent Office."

2. *Partial expiration of Order 3662.* Under the terms of the act only applications accepted by the Patent Office prior to August 8, 1946, can be validated. Hence agent executed applications filed on and after August 8, 1946, cannot be accepted. The first two paragraphs of Order 3662 are no longer in force insofar as acceptance of new agent executed applications is concerned.

3. *Inventions of citizens of enemy countries.* Section 14 of the act excludes inventions or applications made by or owned by citizens of enemy countries from any of the benefits of the act. Consequently, agent executed applications in which the inventor is a citizen of an enemy country cannot be validated, but this prohibition does not apply to applications vested by the Alien Property Custodian. All pending agent executed applications which cannot be validated (that is, applications in which the inventors are citizens of enemy countries and which have not been vested by the Alien Property Custodian) should be taken up immediately and a notice of abandonment mailed (see also paragraph 7 of this order). The application is then to be sent to the abandoned files the next time abandoned files are pulled. If the application is up for action by the Examiner, action on the merits should not be given.

4. *Suspended applications.* All agent executed applications which were otherwise in condition for allowance and in which action by the Office was suspended in accordance with the fourth paragraph of Order 3662 should be taken up and the following disposition made:

(*a*) If the application cannot be validated, it is to be treated as in paragraph 3 of this order.

(*b*) If properly signed and executed papers have been filed, a notice is to be written indicating that the applicant is entitled to the first filing date, and the case passed to issue or other appropriate action taken. Filing of the duplicate copy of the specification with the new petition and oath will constitute the ratification specified in the last paragraph of Order 3662.

(*c*) If papers have been filed but are defective, a notice should be written calling attention to the defects or omissions. The application remains suspended and if the papers are completed in time, it will be treated as in (*b*).

(*d*) In other cases, where the papers have not been filed, a letter is to be written calling attention to the act and to the last paragraph of Order 3662. The application remains suspended and if the papers are filed in time, it will be treated as in (*b*) or (*c*).

5. *Other pending applications.* Other pending agent executed applications which are not covered by paragraphs 3 and 4 of this order should have a notice written in them advising the applicant of the status of the application as in subparagraphs (*b*), (*c*) or (*d*) of paragraph 4. If the application is due for action by the Examiner within approximately the next two months, the notice is to be incorporated in the action when it is made. If the application will not be reached for action that soon, a notice should be sent as soon as possible, concluding with the statement that the application will be taken up for action in due course. If the application is not up for action by the Examiner, the notice should be sent immediately after the response by applicant is received. The notice is not necessarily an action in the case. No positive requirement for the papers or for correction or completion should be made. If the application is otherwise ready for allowance, the notice should so state and further action by the Office suspended as heretofore.

6. *Final roundup.* Properly signed and executed papers cannot be filed after August 8, 1947, to validate an agent executed application. A reasonable time after this date, and thereafter, all suspended applications and those up for action in which the proper papers have not been filed, or have not been filed in time, should be taken up by the Examiner and a notice of abandonment sent.

7. *Reference to Supervisors.* All applications in which a notice, or an action embodying a notice, as required by paragraphs 3, 4, 5, and 6 is being sent should be forwarded to the Supervisory Examiners, with the notice or action, before the letter is mailed. The Supervisory Examiners, in addition to reviewing the letters, will keep an index of all agent executed applications, and will forward the file to the Application Division for entry on its records and endorsement of the front of the file whenever necessary.

CASPER W. OOMS.
Commissioner.

Notice

EXTENSION OF PERIOD OF PRIORITY

PRELIMINARY NOTICE

U. S. PATENT OFFICE, *Washington 25, D. C., Aug. 30, 1946.*

1. Applicants for United States patents, or patentees, seeking an extension of the period of priority under section 1 of Public Law 690, approved August 8, 1946, are required by the act to make a specific request in writing, and to supply a certified copy of the foreign application, a sworn translation of the same if it is not in the English language, and, when necessary, proof of identity of parties.

2. Until and unless the required material is furnished, Examiners will act on applications in the usual way, that is, they will cite and use whatever references and grounds of rejection may be applicable, considering the actual filing date of the application in the United States as the only date to which it is entitled. However, where the statutory bar based on the granting of a foreign patent on an application filed more than one year prior to the filing of the application in the United States is applicable, the Examiner should, as far as possible, also apply other pertinent references and grounds so that in the event the statutory bar is subsequently removed by recourse to the act, prosecution of the application will have been advanced. Applicants must reply to Office actions within the statutory time limit and make as complete replies as are required in any other case.

3. When an application is filed with the object of obtaining the extended period of priority, the allegations in the oath with respect to patenting, publication and public use more than one year prior to the application may be modified in accordance with the last paragraph of section 1 of the act, but the customary oath will be required if the extended date is eventually refused. The customary allegation with respect to no prior foreign patenting on an application filed more than one year prior to the application in this country should, of course, be modified to correctly state the facts whenever necessary. Such applications may be filed any time before August 8, 1947, and need not be accompanied by the papers mentioned in the first paragraph hereof.

4. Persons filing the material required by section 1 and requesting the extended period of priority are not then required to prove that reciprocity exists with their particular country. The Patent Office will determine this fact in the first instance and will act accordingly. When reciprocity has been determined in connection with any country a notice will be published in the OFFICIAL GAZETTE.

5. When the required papers are filed in any case, the Examiner will refer the application immediately to the Supervisory Examiners for instructions as to whether reciprocity exists with respect to the particular country involved and will act accordingly. The existence of reciprocity will be determined by the Commissioner. The Examiners may be instructed to proceed with the examination of the application as to other matters pending this determination.

6. It will also be necessary for the Patent Office to determine in each case that the foreign application is "an application for patent for the same invention" as applied for in the United States (R. S. 4887). This determination will be made in the first instance by the Examiner. Attention is called to the fact that a similar and analogous requirement as to "the same invention" is in the reissue statute, R. S. 4916; mere readability of claims on the earlier case is not always sufficient to constitute "the same invention," and reissue decisions may be considered applicable in determining this question.

7. Any action taken by the Examiner granting or refusing the extended priority date should be referred to the Supervisory Examiners for review before the action is mailed.

8. Requests for extensions of time under section 3 of the act should be accompanied by the appropriate action and by a showing of the cause of the delay. These will be treated procedurally in the same manner as petitions to revive or petitions for delayed payment of a final fee, but a petition fee is not required. An applicant may apply for extensions under both section 1 and section 3 of the act.

9. No application coming under either section 1 or section 3 of the act shall be passed to issue without being first referred to the Supervisory Examiner.

10. Questions arising under the act shall be referred to the Supervisory Examiner.

CASPER W. OOMS,
Commissioner.

REGISTER OF PATENTS AVAILABLE FOR LICENSING OR SALE

(The "Groups" appearing after the patent abstracts are based on the Standard Industrial Classification Manual, Vol. I, Manufacturing Industries, Executive Office of the President, Bureau of the Budget)

Owens-Corning Fiberglas Corporation is the record owner of a number of patents which relate to glass fibers, glass fiber products, and their manufacture. These include inventions relating to glass textile yarns and fabrics for draperies, coated cloths, plastic reinforcement, electrical insulation and other applications; glass fiber packs for air filters and chemical processing; glass fiber mats for batteries, roofing, pipe wrap and the like; glass fiber insulation for household appliances, homes, factories, aircraft, ships and trains; and a variety of other new glass fiber products.

These patents are registered as Nos. 3,925 to 4,081, inclusive, and are available for licensing, on reasonable terms to any prospective manufacturer who can meet reasonable requirements of financial responsibility.

LIST A

Owens-Corning Fiberglas Corporation patents available for license for reasonable royalty

Pat. 1,738,217. METHOD AND APPARATUS FOR SPINNING GLASS. Patented Dec. 3, 1929.

Pat. 1,898,424. FRAMEWORK FOR AIR FILTERS. Patented Feb. 21, 1933.

Pat. 2,016,401. CAKED GLASS WOOL AND ITS MANUFACTURE. Patented Oct. 8, 1935.

Pat. 2,044,221. FRAMEWORK FOR AIR FILTERS. Patented June 16, 1936.

Pat. 2,068,202. MANUFACTURE OF GLASS WOOL. Patented Jan. 19, 1937.

Pat. 2,068,203. METHOD AND APPARATUS FOR MANUFACTURING AND FABRICATING GLASS WOOL. Patented Jan. 19, 1937.

Pat. 2,077,951. AIR FILTER. Patented Apr. 20, 1937.

Pat. 2,083,132. METHOD AND PRODUCT FOR TREATING GLASS WOOL. Patented June 8, 1937.

Pat. 2,107,284. METHOD AND PRODUCT FOR TREATING GLASS WOOL. Patented Feb. 8, 1938.

Pat. 2,117,371. BATTERY SEPARATOR PLATE. Patented May 17, 1938.

Pat. 2,118,271. AIR FILTER ENVELOPE. Patented May 24, 1938.

Pat. 2,121,802. METHOD AND APPARATUS FOR STRENGTHENING FIBERS. Patented June 28, 1938.

Pat. 2,122,514. AIR FILTERING MATERIAL. Patented July 5, 1938.

Pat. 2,131,750. WATERPROOF AND OILPROOF BINDER. Patented Oct. 4, 1938.

Pat. 2,132,702. COMBINED ASBESTOS AND GLASS FIBER YARN. Patented Oct. 11, 1938.

Pat. 2,133,183. ELECTRICAL INSULATION. Patented Oct. 11, 1938.

Pat. 2,133,235. METHOD AND APPARATUS FOR MAKING GLASS WOOL. Patented Oct. 11, 1938.

Pat. 2,133,236. GLASS WOOL AND METHOD AND APPARATUS FOR MAKING SAME. Patented Oct. 11, 1938.

Pat. 2,133,237. TEXTILE MATERIAL. Patented Oct. 11, 1938.

Pat. 2,133,238. GLASS FABRIC. Patented Oct. 11, 1938.

Pat. 2,134,009. LOW TEMPERATUE INSULATION. Patented Oct. 25, 1938.

Pat. 2,134,340. HEAT INSULATION. Patented Oct. 25, 1938.

Pat. 2,137,246. FILTER. Patented Nov. 22, 1938.

Pat. 2,138,874. FILTER UNIT. Patented Dec. 6, 1938.

Pat. 2,145,898. ADHESIVE COATING FOR FILTERS. Patented Feb. 7, 1939.

Pat. 2,145,899. METHOD AND APPARATUS FOR NODULIZING FIBROUS MATERIAL. Patented Feb. 7, 1939.

Pat. 2,150,945. METHOD AND APPARATUS FOR SPINNING GLASS WOOL. Patented Mar. 21, 1939.

Pat. 2,154,476. APPARATUS FOR MANUFACTURING GLASS WOOL BATS AND OTHER ARTICLES. Patented Apr. 18, 1939.

Pat. 2,156,316. APPARATUS FOR MAKING FIBROUS MATERIALS. Patented May 2, 1939.

Pat. 2,159,028. INSULATING BAT. Patented May 23, 1939.

Pat. 2,159,053. INSULATING BAT. Patented May 23, 1939.

Pat. 2,160,001. GLASS WOOL PACKING. Patented May 30, 1939.

Pat. 2,160,003. AIR FILTER. Patented May 30, 1939.

Pat. 2,160,009. PIPE COVERING. Patented May 30, 1939.

Pat. 2,165,280. METHOD AND APPARATUS FOR FORMING A FIBROUS MAT. Patented July 11, 1939.

Pat. 2,165,318. APPARATUS FOR FEEDING MOLTEN GLASS. Patented July 11, 1939.

Pat. 2,168,366. POROUS TUBE FOR STORAGE BATTERY ELECTRODES. Patented Aug. 8, 1939.

Pat. 2,175,195. SPRING TAKE-UP FOR FILTER UNITS. Patented Oct. 10, 1939.

Pat. 2,175,224. ELECTRICALLY HEATED BLOWER. Patented Oct. 10, 1939.

Pat. 2,175,225. METHOD OF MAKING GLASS WOOL. Patented Oct. 10, 1939.

Pat. 2,177,323. METHOD AND APPARATUS FOR CONTROLLING THE IMPREGNATION OF TEXTILES. Patented Oct. 24, 1939.

Pat. 2,178,614. AIR FILTER. Patented Nov. 7, 1939.

Pat. 2,184,286. FIBROUS BAT MARKING. Patented Dec. 26, 1939.

Pat. 2,184,316. MINERAL FIBER BINDER. Patented Dec. 26, 1939.

Pat. 2,184,320. TREATMENT OF GLASS FIBERS. Patented Dec. 26, 1939.

Pat. 2,188,927. ELECTRICALLY HEATING MOLTEN GLASS. Patented Feb. 6, 1940.

Pat. 2,189,822. METHOD AND APPARATUS FOR MAKING GLASS WOOL. Patented Feb. 13, 1940.

Pat. 2,189,840. METHOD FOR APPLYING COATINGS TO FIBERS IN MAT FORM. Patented Feb. 13, 1940.

Pat. 2,192,917. APPARATUS FOR CLEARING MATTED MATERIAL FROM A SUPPORTING SCREEN. Patented Mar 12, 1940.

Pat. 2,192,944. APPARATUS FOR MANUFACTURING GLASS WOOL. Patented Mar. 12, 1940.

Pat. 2,206,058. MANUFACTURE OF GLASS WOOL. Patented July 2, 1940.

Pat. 2,206,059. FIBROUS GLASS FELT. Patented July 2, 1940.

Pat. 2,206,060. METHOD AND APPARATUS FOR FIBERIZING VITREOUS MATERIAL. Patented July 2, 1940.

Pat. 2,207,764. METHOD AND APPARATUS FOR MAKING GLASS WOOL. Patented July 16, 1940.

Pat. 2,208,897. WIRE COVERING DEVICE. Patented July 23, 1940.

Pat. 2,209,850. FIBROUS GLASS TEXTILE MATERIAL FOR ELECTRICAL INSULATION. Patented July 30, 1940.

Pat. 2,214,294. INSULATION COVERING. Patented Sept. 10, 1940.

Pat. 2,216,759. APPARATUS FOR FABRICATING FIBROUS MATERIAL. Patented Oct. 8, 1940.

Pat. 2,219,285. APPARATUS AND METHOD FOR NODULATING FIBERS. Patented Oct. 29, 1940.

Pat. 2,219,346. METHOD AND APPARATUS FOR PRODUCING FIBROUS MATERIAL. Patented Oct. 29, 1940.

Pat. 2,220,127. AIR FILTER. Patented Nov. 5, 1940.

Pat. 2,220,433. GLASS WOOL APPARATUS. Patented Nov. 5, 1940.

Pat. 2,224,149. APPARATUS FOR COATING STRANDS. Patented Dec. 10, 1940.

Pat. 2,224,466. SKIRTED BLOWER. Patented Dec. 10, 1940.

Pat. 2,225,009. METHOD OF BONDING FIBER GLASS WITH CARBON. Patented Dec. 17, 1940.

Pat. 2,225,667. APPARATUS FOR DRAWING GLASS FIBERS. Patented Dec. 24, 1940.

Pat. 2,227,357. PRODUCTION OF FIBER GLASS. Patented Dec. 31, 1940.

Pat. 2,230,270. APPARATUS FOR FORMING WEBS OF FIBROUS MATERIAL. Patented Feb. 4, 1941.

Pat. 2,230,271. METHOD OF PRODUCING COMBINED ASBESTOS AND GLASS FIBER YARNS. Patented Feb. 4, 1941.

Pat. 2,230,272. METHOD OF PRODUCING GLASS FIBERS. Patented Feb. 4, 1941.

Pat. 2,231,815. FIBROUS ARTICLE. Patented Feb. 11, 1941.

Pat. 2,233,433. GLASS WOOL. Patented Mar. 4, 1941.

Pat. 2,233,435. GLASS STOCK FOR ELECTRIC MELTING. Patented Mar. 4, 1941.

Pat. 2,234,986. MECHANICALLY DRAWING FIBERS. Patented Mar. 18, 1941.

Pat. 2,235,352. APPARATUS FOR BLOWING GLASS WOOL. Patented Mar. 18, 1941.

Pat. 2,238,204. METHOD AND APPARATUS FOR THE PRODUCTION OF FINE FILAMENTS OF GLASS. Patented Apr. 15, 1941.

Pat. 2,239,722. APPARATUS FOR MAKING SLIVER. Patented Apr. 29, 1941.

Pat. 2,241,405. APPARATUS FOR GATHERING FIBERS. Patented May 13, 1941.

Pat. 2,245,783. METHOD OF COLORING GLASS FIBERS. Patented June 17, 1941.

Reissue 21,863. METHOD AND APPARATUS OF MELTING AND FINING GLASS. Reissued July 22, 1941.

Pat. 2,252,157. INSULATING BAT. Patented Aug. 12, 1941.

Pat. 2,252,724. AIR FILTER. Patented Aug. 19, 1941.

Pat. 2,255,578. ELECTRIC FURNACE. Patented Sept. 9, 1941.

Pat. 2,257,767. APPARATUS FOR THE MANUFACTURE OF GLASS FIBERS. Patented Oct. 7, 1941.

Pat. 2,261,148. METHOD OF TREATING FIBROUS GLASS. Patented Nov. 4, 1941.

Pat. 2,263,207. INTERMITTENT CONVEYOR. Patented Nov. 18, 1941.

Pat. 2,263,217. HEAT TREATMENT OF GLASS TEXTILES. Patented Nov. 18, 1941.

Pat. 2,264,285. ELECTRICAL RESISTANCE AND METHOD OF MAKING SAME. Patented Dec. 2, 1941.

Pat. 2,264,345. METHOD OF MAKING SLIVERS. Patented Dec. 2, 1941.

Pat. 2,269,459. TUBULAR FIBER. Patented Jan. 13, 1942.

Pat. 2,269,497. NICKEL-PLATINUM ALLOY. Patented Jan. 13, 1942.

Pat. 2,272,180. STITCHING MECHANISM. Patented Feb. 10, 1942.

Pat. 2,272,215. AUTOMATIC CUTOFF DEVICE. Patented Feb. 10, 1942.

Pat. 2,272,588. COATING FOR FIBROUS GLASS STRANDS. Patented Feb. 10, 1942.

Pat. 2,274,681. WINDING MECHANISM AND METHOD. Patented Mar. 3, 1942.

Reissue 22,078. SLIVER FORMATION. Reissued Apr. 21, 1942.

Pat. 2,280,101. ELECTRIC FURNACE AND MELTING METHOD. Patented Apr. 21, 1942.

Pat. 2,286,603. SPACING MECHANISM FOR CONVEYERS. Patented June 16, 1942.

Pat. 2,286,903. FIBER PRODUCING MECHANISM. Patented June 16, 1942.

Pat. 2,287,006. APPARATUS FOR MAKING GLASS WOOL. Patented June 16, 1942.

Pat. 2,287,007. METHOD OF MAKING GLASS WOOL. Patented June 16, 1942.

Pat. 2,288,072. METHOD AND APPARATUS FOR MAKING BONDED FIBROUS PRODUCTS. Patented June 30, 1942.

Pat. 2,291,289. APPARATUS FOR MAKING SILICEOUS FIBERS. Patented July 28, 1942.

Pat. 2,293,677. ELECTRICAL CABLE COVERING. Patented Aug. 18, 1942.

Pat. 2,300,736. METHOD OF MAKING FILAMENTOUS GLASS. Patented Nov. 3, 1942.

Pat. 2,304,233. METHOD OF INSULATING PANELS. Patented Dec. 8, 1942.

Pat. 2,306,347. METHOD AND APPARATUS FOR MAKING FIBROUS GLASS PRODUCTS. Patented Dec. 22, 1942.

Pat. 2,308,857. SODIUM CALCIUM BOROSILICATE GLASS. Patented Jan. 19, 1943.

Pat. 2,311,704. METHOD OF MAKING PARALLEL FIBER UNITS. Patented Feb. 23, 1943.

Pat. 2,313,630. METHOD AND APPARATUS FOR PRODUCING GLASS FIBERS. Patented Mar. 9, 1943.

Pat. 2,314,857. APPARATUS FOR MANUFACTURING SLIVERS. Patented Mar. 23, 1943.

Pat. 2,314,956. ELECTRIC FURNACE. Patented Mar. 30, 1943.

Pat. 2,315,259. TREATING GLASS FIBERS. Patented Mar. 30, 1943.

Pat. 2,318,243. APPARATUS FOR FIBERIZING FUSIBLE INORGANIC SUBSTANCES AND FORMING THE FIBERS INTO BATS. Patented May 4, 1943.

Pat. 2,318,244. FIBERIZING MINERAL SUBSTANCES BY CENTRIFUGE AND BLAST. Patented May 4, 1943.

Pat. 2,318,821. METHOD AND APPARATUS FOR MAKING FIBROUS MINERAL MATERIAL. Patented May 11, 1943.

Pat. 2,323,684. COATED GLASS FIBER STRAND. Patented July 6, 1943.

Pat. 2,325,640. TRAVERSING MEANS FOR HIGH SPEED WINDING. Patented Aug. 3, 1943.

Pat. 2,328,302. METHOD OF MAKING PARALLEL FIBER FILTERS. Patented Aug. 31, 1943.

Pat. 2,331,145. METHOD OF FELTING FIBROUS GLASS. Patented Oct. 5, 1943.

Pat. 2,331,146. METHOD OF FELTING GLASS FIBERS. Patented Oct. 5, 1943.

Pat. 2,332,273. FIBROUS GLASS PRODUCT. Patented Oct. 19, 1943.

Pat. 2,332,274. FIBER FORMING APPARATUS. Patented Oct. 19, 1943.

Pat. 2,334,961. GLASS COMPOSITION. Patented Nov. 23, 1943.

Pat. 2,335,102. METHOD OF PRODUCING INORGANIC FIBROUS MATERIAL. Patented Nov. 23, 1943.

Pat. 2,335,135. MANUFACTURE OF FIBROUS GLASS. Patented Nov. 23, 1943.

Pat. 2,339,431. FIBROUS GLASS PRODUCT. Patented Jan. 18, 1944.

Pat. 2,339,590. PRESSURE REGULATOR. Patented Jan. 18, 1944.

Pat. 2,339,928. METHOD OF TREATING GLASS FIBERS AND ARTICLE MADE THEREBY. Patented Jan. 25, 1944.

Pat. 2,341,219. CARBONACEOUS COATING FOR GLASS FIBERS. Patented Feb. 8, 1944.

Pat. 2,344,601. TREATMENT OF FIBROUS GLASS. Patented Mar. 21, 1944.

Pat. 2,348,182. APPARATUS FOR PRODUCING FIBROUS GLASS. Patented May 2, 1944.

Pat. 2,350,996. METHOD OF FORMING PIPE COVERINGS. Patented June 13, 1944.

Pat. 2,351,802. MINERAL WOOL TREATING MATERIAL. Patented June 20, 1944.

Pat. 2,352,780. WINDING APPARATUS. Patented July 4, 1944.

Pat. 2,352,781. TRAVERSING APPARATUS. Patented July 4, 1944.

Pat. 2,353,887. FIBER ATTENUATING APPARATUS. Patented July 18, 1944.

Pat. 2,353,936. AIR FILTERING MATERIAL. Patented July 18, 1944.

Pat. 2,353,937. AIR FILTERING MATERIAL. Patented July 18, 1944.

Pat. 2,360,373. APPARATUS FOR FEEDING GLASS IN THE MANUFACTURE OF FIBERS. Patented Oct. 17, 1944.

Pat. 2,363,470. METHOD FOR MAKING SLIVER. Patented Nov. 21, 1944.

Pat. 2,364,569. HIGH-SPEED TRAVERSING MEANS. Patented Dec. 5, 1944.

Pat. 2,373,077. APPARATUS FOR MANUFACTURING BONDED FIBROUS MATS. Patented Apr. 3, 1945.

Pat. 2,373,078. GUIDE FOR GLASS AND THE LIKE FIBERS. Patented Apr. 3, 1945.

Pat. 2,377,771. TRAVERSING MEANS FOR HIGH-SPEED WINDING. Patented June 5, 1945.

Pat. 2,377,772. APPARATUS FOR THE PRODUCTION OF GLASS FIBERS. Patented June 5, 1945.

Pat. 2,380,915. APPARATUS FOR ATTENUATING FIBERS. Patented Aug. 7, 1945.

Pat. 2,383,168. APPARATUS FOR MELTING GLASS. Patented Aug. 21, 1945.

Pat. 2,386,158. MAKING AND PACKING STRANDS OF MATERIAL. Patented Oct. 2, 1945.

Pat. 2,390,370. MANUFACTURE OF GLASS YARN. Patented Dec. 4, 1945.

Pat. 2,391,870. TRAVERSING MECHANISM. Patented Jan. 1, 1946.

Pat. 2,392,805. GLASS FIBER STRAND. Patented Jan. 15, 1946.

Pat. 2,392,882. METHOD OF DEPOSITING FIBROUS MATERIAL. Patented Jan. 15, 1946.

Pat. 2,394,493. COLORED GLASS FIBERS. Patented Feb. 5, 1946.

Pat. 2,395,371. CRIMPED FIBROUS GLASS. Patented Feb. 19, 1946.

Pat. 2,397,453. TREATMENT OF FIBROUS MATERIAL. Patented Mar. 26, 1946.

Pat. 2,398,808. APPARATUS FOR FORMING FIBROUS STRANDS. Patented Apr. 23, 1946.

The Owens-Corning Fiberglas Corporation is also the record owner of a number of patents on inventions which are not directly usable for the manufacture of glass fibers, but which cover the use of glass fibers or glass fiber products in various types of manufactured articles or equipment. These patents are registered as Nos. 4,082 to 4,105, inclusive, and are available for royalty-free licensing to any prospective manufacturer making request therefor upon payment of a five dollar application fee for each patent.

LIST B

Owens-Corning Fiberglas Corporation patents available for license on a royalty-free basis

Pat. 1,999,142. AIR FILTER SYSTEM. Patented Apr. 23, 1935.

Pat. 2,092,783. MEANS FOR CONTROLLING DENSITY OF INSULATING MATERIAL. Patented Sept. 14, 1937.

Pat. 2,120,270. WIRE HAVING A COVERING OF FIBROUS MATERIAL. Patented June 14, 1938.

Pat. 2,135,057. FABRIC BELTING. Patented Nov. 1, 1938.

Pat. 2,143,015. PACKING MATERIAL FOR FRACTIONATING AND SCRUBBING TOWERS. Patented Jan. 10, 1939.

Pat. 2,143,016. FIBROUS MATERIAL FOR FLUID CONTACTS. Patented Jan. 10, 1939.

Pat. 2,148,496. INSTALLATION OF ACOUSTICAL INSULATING MATERIAL. Patented Feb. 28, 1939.

Pat. 2,148,510. STORAGE BATTERY-BOX COMPOSITION. Patented Feb. 28, 1939.

Pat. 2,184,326. TIRE. Patented Dec. 26, 1939.

Pat. 2,184,899. FIBER GLASS WICKING. Patented Dec. 26, 1939.

Pat. 2,192,933. HEAT INSULATION. Patented Mar. 12, 1940.

Pat. 2,192,939. AGRICULTURAL APPLICATION OF GLASS WOOL. Patented Mar. 12, 1940.

Pat. 2,198,620. PAD FOR PRESSING MACHINES. Patented Apr. 30, 1940.

Pat. 2,202,820. COMMUTATOR. Patented June 4, 1940.

Pat. 2,210,958. BREATHING MEANS FOR PIPE INSULATION. Patented Aug. 13, 1940.

Pat. 2,214,750. AIR FILTER. Patented Sept. 17, 1940.

Pat. 2,224,484. HIGH VOLTAGE INSULATED CABLE. Patented Dec. 10, 1940.

Pat. 2,272,229. IDENTIFYING MEANS FOR TEXTILES. Patented Feb. 10, 1942.

Pat. 2,311,613. TRANSPARENT COMPOSITE MATERIAL. Patented Feb. 16, 1943.

Pat. 2,323,297. HEAT INSULATING CONSTRUCTION. Patented July 6, 1943.

Pat. 2,345,300. HEATING PAD. Patented Mar. 28, 1944.

Pat. 2,373,082. APPARATUS FOR APPLYING MATS TO BATTERY PLATES. Patented Apr. 3, 1945.

Pat. 2,376,698. FASTENING FOR FIBROUS BOARDS. Patented May 22, 1945.

Pat. 2,390,039. INSULATED ELECTRICAL CONDUCTOR. Patented Nov. 27, 1945.

Detailed information may be obtained from Carl G. Staelin, Secretary, Owens-Corning Fiberglas Corp., Toledo 1, Ohio.

TRADE-MARKS

OFFICIAL GAZETTE, OCTOBER 1, 1946

[VOL. 591. No. 1]

The following trade-marks are published in compliance with section 6 of the act of February 20, 1905, as amended March 2, 1907. Notice of opposition must be filed within thirty days of this publication.

Marks applied for "under the ten-year proviso" are registrable under the provision in clause (b) of section 5 of said act as amended February 18, 1911.

As provided by section 14 of said act, a fee of ten dollars must accompany each notice of opposition.

CLASS 1

RAW OR PARTLY PREPARED MATERIALS

Ser. No. 479,529. SEARS, ROEBUCK AND CO., Chicago, Ill. Filed Feb. 7, 1945.

FARM MASTER

The word "Farm" is disclaimed apart from the mark. The portrait is fanciful.

FOR PEAT MOSS, USED AS A POULTRY LITTER.

Claims use since Jan. 15, 1941.

CLASS 2

RECEPTACLES

Ser. No. 488,886. CHRISTY L. BERG, doing business as Berg Vault Company, St. Louis, Mo. Filed Sept. 24, 1945.

BRONZOLEUM

FOR BURIAL VAULTS AND CASKETS.

Claims use since Jan. 2, 1945.

Ser. No. 492,803. STRATOSOL CORPORATION, New York, N. Y. Filed Dec. 6, 1945.

FIREWARDEN

FOR WASTEBASKETS ADAPTED TO CONTROL AND SMOTHER FIRE.

Claims use since Nov. 2, 1945.

Ser. No. 503,760. FRANK M. SAYFORD CO. INC., Brooklyn, N. Y. Filed June 12, 1946.

CARRIE-CUP

A Sayford Product

The words "Cup" and "A Sayford Product" and the representation of a paper cup are disclaimed apart from the mark.

FOR PAPER CUPS.

Claims use since Nov. 8, 1944.

CLASS 3

BAGGAGE, ANIMAL EQUIPMENTS, PORTFOLIOS, AND POCKETBOOKS

Ser. No. 503,238. ANGLO-AMERICAN LEATHERGOODS CO., INC., New York, N. Y. Filed June 4, 1946.

PALL MALL

FOR WALLETS AND BILLFOLDS.

Claims use since Apr. 15, 1946.

CLASS 4

ABRASIVE, DETERGENT, AND POLISHING MATERIALS

Ser. No. 488,560. ALFRED ANDERSON, doing business as Anderson Chemical Company, Litchfield, Minn. Filed Sept. 17, 1945.

Aerol

FOR GENERAL PURPOSE SOAPLESS POWDERED CLEANSER HAVING A PETROLEUM BASE.

Claims use since July 30, 1945.

Ser. No. 494,233. THE PYNOL COMPANY, Quincy, Ill. Filed Jan. 3, 1946.

PYNOL

FOR SOAP.
Claims use since Nov. 2, 1936.

CLASS 6

CHEMICALS, MEDICINES, AND PHARMACEUTICAL PREPARATIONS

Ser. No. 482,657. STANLEY HOME PRODUCTS, INC., Springfield, Mass. Filed Apr. 26, 1945.

STAN-WICK

Applicant disclaims apart from the mark any exclusive right to the word "Wick."
FOR DEODORANT.
Claims use since Mar. 10, 1945.

Ser. No. 489,933. BEE CHEMICAL COMPANY, Chicago, Ill. Filed Oct. 15, 1945.

STEE-LIFE

FOR CORROSION PREVENTATIVE COMPOSITIONS.
Claims use since September 1945.

Ser. No. 490,045. RUTH WEISSBERG, doing business as Ruth Darling Lab., Newark, N. J. Filed Oct. 16, 1945.

OILEX

FOR NAIL POLISH REMOVER.
Claims use since June 14, 1945.

Ser. No. 490,457. MARIE RICHELIEU PARFUM ODESANT, INC., New York, N. Y. Filed Oct. 24, 1945.

PINK LILAC

The word "Lilac" is disclaimed apart from the mark.
FOR TOILET WATER AND PERFUME.
Claims use since April 1941 on toilet water; and since Feb. 7, 1944, on perfume.

Ser. No. 491,289. TENNESSEE EASTMAN CORPORATION, Kingsport, Tenn. Filed Nov. 8, 1945.

TECMANGAM

FOR CHEMICAL PREPARATION INCLUDING THE SULPHATES OF MANGANESE, AMMONIUM, AND MAGNESIUM FOR GENERAL USE IN THE AGRICULTURAL AND INDUSTRIAL ARTS.
Claims use since Nov. 7, 1930.

Ser. No. 491,386. BEE CHEMICAL COMPANY, Chicago, Ill. Filed Nov. 10, 1945.

DUO-LYFE

FOR TOOL LIFE INCREASING CHEMICALS FOR METAL INDUSTRY: GRINDING CHEMICALS, MACHINING CATALYSTS, PICKLING INHIBITORS, ADDITIVES AND CUTTING CHEMICALS CONTAINING ADDITIVES. THE PRODUCTS ARE TO BE USED FOR ADDITION TO SOLVENTS SUCH AS WATER OR HYDROCARBON SOLVENTS, TO GIVE TO THESE SOLVENTS THE PROPERTIES FAVORABLE IN THE MACHINING OF METALS, SUCH AS ANTI-WELDING, ANTI-CORROSION AND LUBRICITY PROPERTIES. THEY ARE USED EITHER BY PUMPING ONTO THE TOOL, WHILE THE TOOL IS ACTING ON METAL, OR IN CASE OF DRAWING OPERATIONS THEY MAY BE APPLIED TO THE METAL SO AS TO BE PRESENT ON THE METAL ALREADY IN ADVANCE OF THE MACHINING OPERATION.
Claims use since September 1945.

Ser. No. 492,195. JAY C. HALL, doing business as Rintzet Co., Huntington Park, Calif. Filed Nov. 26, 1945.

RINTZ WITH RINTZET

FOR PREPARATION FOR USE IN COUNTERACTING THE ODOR OF ALCOHOLIC BREATH.
Claims use since Oct. 5, 1945.

Ser. No. 492,213. THE WM. S. MERRELL COMPANY, Cincinnati, Ohio. Filed Nov. 26, 1945.

ORAMYCIN

FOR TABLET FOR ORAL ADMINISTRATION AS AN ANTACID.
Claims use since Nov. 15, 1945.

Ser. No. 492,824. CONSOLIDATED COSMETICS, Chicago, Ill. Filed Dec. 7, 1945.

TABU

FOR PERFUME, COLOGNE, LIPSTICK, FACE POWDER, SACHET POWDER, BRILLIANTINE, AND HAND LOTION.
Claims use since Dec. 10, 1932.

Ser. No. 493,807. ABBOTT LABORATORIES, North Chicago, Ill. Filed Dec. 15, 1945.

RIBOTINIC

FOR VITAMIN PREPARATION CONTAINING RIBOFLAVIN AND NICOTINAMIDE AS ITS PRINCIPAL ACTIVE INGREDIENTS, MARKETED IN STERILE AMPOULES FOR HYPODERMIC INJECTION BY OR UNDER THE DIRECTION OF A PHYSICIAN.
Claims use since July 14, 1942.

Ser. No. 494,773. AVON PRODUCTS, INC., New York, N. Y. Filed Jan. 15, 1946.

CYCLONE RED

No claim is made to the word "Red" apart from the mark.
FOR LIPSTICK, ROUGE, AND NAIL POLISH.
Claims use since Oct. 25, 1945.

Ser. No. 494,778. AVON PRODUCTS, INC., New York, N. Y. Filed Jan. 15, 1946.

RIDDLE RED

No claim is made to the word "Red" apart from the mark.
FOR LIPSTICK, ROUGE, AND NAIL POLISH.
Claims use since Oct. 25, 1945.

Ser. No. 494,779. AVON PRODUCTS, INC., New York, N. Y. Filed Jan. 15, 1946.

RUGGED

FOR AFTER-SHAVING LOTION, TOILET WATER, TALCUM POWDER, AND HAIR DRESSING.
Claims use since Oct. 25, 1945.

Ser. No. 495,821. PREMO PHARMACEUTICAL LABORATORIES, INC., New York, N. Y. Filed Feb. 1, 1946.

PREMOCILLIN

FOR ORAL PENICILLIN.
Claims use since Jan. 23, 1946.

CLASS 8

SMOKERS' ARTICLES, NOT INCLUDING TOBACCO PRODUCTS

Ser. No. 491,620. ART-CRAFT BRIAR PIPE CO., Brooklyn, N. Y. Filed Nov. 15, 1945.

Lady Diane

FOR SMOKING PIPES.
Claims use since Oct. 29, 1944.

Ser. No. 494,397. DAN FILLSON, Fairbanks, Territory of Alaska. Filed Jan. 7, 1946.

FOR PIPES.
Claims use since Dec. 1, 1945.

CLASS 12

CONSTRUCTION MATERIALS

Ser. No. 501,027. TIDEWATER PLYWOOD COMPANY, Brunswick, Ga. Filed Apr. 26, 1946.

PLAS-TIED

FOR LAMINATED PLYWOOD LUMBER FOR BUILDING PURPOSES.
Claims use since Apr. 9, 1946.

Ser. No. 501,028. TIDEWATER PLYWOOD COMPANY, Brunswick, Ga. Filed Apr. 26, 1946.

TIED-WOOD

No claim is made for the word "Wood" apart from the mark.
FOR LAMINATED PLYWOOD LUMBER FOR BUILDING PURPOSES.
Claims use since Apr. 10, 1946.

Ser. No. 501,046. THE CELOTEX CORPORATION, Chicago, Ill. Filed Apr. 27, 1946.

No claim is made to the words "Texas" and "Tile" per se apart from the mark.
FOR PARTITION TILES.
Claims use since Apr. 17, 1945.

CLASS 13

HARDWARE AND PLUMBING AND STEAM-FITTING SUPPLIES

Ser. No. 488,172. STRONG, CARLISLE & HAMMOND COMPANY, Cleveland, Ohio. Filed Sept. 8, 1945.

HI-CAP

FOR VALVE AND SEAT ASSEMBLIES FOR STEAM TRAPS.
Claims use since Aug. 10, 1945.

CLASS 15

OILS AND GREASES

Ser. No. 482,361. ROBERT J. BELL, doing business as Bell Laboratories, Orlando, Fla. Filed Apr. 20, 1945.

The drawing is lined for the color red.
FOR OIL USED TO DISSOLVE CARBON AND FOR THE PURPOSE OF IMPROVING THE OPERATION OF INTERNAL COMBUSTION ENGINES.
Claims use since Jan. 1, 1927.

Ser. No. 485,424. SOCIETE ANONYME SOLEX, Neuilly-sur-Seine (Seine), France. Filed July 3, 1945.

SOLEXOL

FOR PETROLEUM PRODUCTS CONSISTING OF GASOLINE, LUBRICATING OILS, LUBRICATING GREASES, AND A MIXTURE OF GASOLINE AND LUBRICATING OIL ADAPTED FOR USE IN TWO-STROKE ENGINES.
Claims use since Mar. 2, 1942.

Ser. No. 488,420. PLYMOUTH WHOLESALE DRY GOODS CORPORATION, New York, N. Y. Filed Sept. 13, 1945. Under the act of February 20, 1905, as amended June 10, 1938.

Hearthstone

FOR CANDLES.
Claims use since Feb. 13, 1945.

Ser. No. 496,197. THE CANFIELD OIL COMPANY, Cleveland, Ohio. Filed Feb. 8, 1946.

Wm. Tell

The mark is the name of a mythical character used in an old Swiss legend, wherein a father was ordered to knock off by arrow an apple on the head of his son.
FOR LUBRICATING OILS.
Claims use since Jan. 17, 1946.

CLASS 17

TOBACCO PRODUCTS

Ser. No. 496,565. ROBERT H. PATTERSON, Atlanta, Ga. Filed Feb. 14, 1946.

The name "Marshal Ney" and the portrait is that of the Duke of Elchingen, Prince of Moskva, and Marshal of France, deceased.
FOR CIGARS, CIGARETTES, SMOKING TOBACCO, CHEWING TOBACCO, AND SNUFF.
Claims use since Jan. 10, 1886.

CLASS 19

VEHICLES

Ser. No. 493,530. BEN G. BARNETT, doing business as Harben Manufacturing Company, Dallas, Tex. Filed Dec. 19, 1945.

FOR COLLAPSIBLE CANOPY FRAME FOR ATTACHMENT TO AUTOMOTIVE VEHICLES COMBINED WITH CANVAS COVERS THEREFOR.
Claims use since Nov. 1, 1945.

CLASS 21

ELECTRICAL APPARATUS, MACHINES, AND SUPPLIES

Ser. No. 474,345. THE NEW INSULATION COMPANY LIMITED, Gloucester, England. Filed Sept. 18, 1944.

INSULAM

FOR ELECTRICAL INSULATING MATERIALS CONSISTING OF WOOD VENEER IMPREGNATED WITH SYNTHETIC RESIN AND INSULATORS MADE THEREFROM.
Claims use since June 1, 1943.

Ser. No. 491,097. INDUSTRIAL TAPE CORPORATION, New Brunswick, N. J. Filed Nov. 5, 1945.

TEXCEL

FOR ADHESIVE TAPES USED IN THE ELECTRICAL INDUSTRY FOR BINDING AND INSULATING, AND IN THE CONSTRUCTION OF ELECTRICAL GOODS AND ELECTRICAL STRUCTURES.
Claims use since Mar. 3, 1939.

Ser. No. 494,924. FRANK RIEBER, doing business as Rieber Research Laboratory, New York, N. Y., and elsewhere. Filed Jan. 17, 1946.

VIBROTRON

FOR ELECTRICAL OSCILLATORS AND FILTERS.
Claims use since Oct. 25, 1945.

Ser. No. 495,802. HIPWELL MANUFACTURING COMPANY, Pittsburgh, Pa. Filed Feb. 1, 1946.

Duro-lite

The term "Lite" is disclaimed apart from the mark.
FOR CASINGS FOR PORTABLE BATTERY OPERATED FLASH LAMPS, AND LANTERNS.
Claims use since January 1938.

Ser. No. 496,487. TRANS-LUX NEWS-SIGN CORPORATION, New York, N. Y. Filed Feb. 12, 1946.

'FLASHCAST'

FOR ELECTRICALLY LIGHTED AND OPERATED TRAVELLING MESSAGE SIGNS.
Claims use since Dec. 21, 1945.

219,874. **TUDUCO.** TENTS, AWNINGS, PAULINS, AND COVERS FOR PROTECTION OF MERCHANDISE SUCH AS WAGON, TRUCK, AND HAY COVERS. Registered Oct. 26, 1926. TUCKER DUCK & RUBBER CO., Fort Smith, Ark., a corporation of Arkansas. Renewed October 26, 1946. Class 50.

219,882. **"APEX" ETC. AND DESIGN.** COATED FABRICS, ENAMELLED CLOTH, ARTIFICIAL LEATHER, WATERPROOF COTTON GOODS IN THE PIECE, WATERPROOF UPHOLSTERING FABRICS, WATERPROOF PAPIER-MÂCHÉ, WATERPROOF CANVAS, AND WATERPROOF MOHAIR. Registered Oct. 26, 1926. APEX COATED FABRICS CO. INC., New York, N. Y., a corporation of New York. Renewed Oct. 26, 1946. Classes 42, 50, and 20.

219,906. **"SAN-EQUIP".** SEPTIC TANKS. Registered Oct. 26, 1926. CHEMICAL TOILET CORPORATION. Renewed Oct. 26, 1946, to San-Equip, Inc., Syracuse, N. Y., a corporation of New York. Class 2.

219,911. **"COLONIAL TANNING COMPANY" ETC. AND DRAWING.** RAW OR PARTLY-PREPARED LEATHER. Registered Oct. 26, 1926. COLONIAL TANNING COMPANY. Renewed Oct. 26, 1946, to Colonial Tanning Company, Inc., Boston, Mass., a corporation of Massachusetts. Class 1.

219,912. **MARY MAE.** CHILDREN'S APPAREL—NAMELY, HATS. Registered Oct. 26, 1926. THE MAY DEPARTMENT STORES COMPANY, St. Louis, Mo. Renewed Oct. 26, 1946, to The May Department Stores Company, New York, N. Y., a corporation of New York. Class 39.

219,918. **MAXIMILLER.** ALL-GEARED PLAIN MILLING MACHINES, ALL-GEARED UNIVERSAL MILLING MACHINES, ALL-GEARED VERTICAL MILLING MACHINES, AND ALL-GEARED ADJUSTABLE-SPINDLE MILLING MACHINES. Registered Oct. 26, 1926. THE KEMPSMITH MANUFACTURING CO. Renewed Oct. 26, 1946, to The Kempsmith Machine Company, West Allis, Wis., a corporation of Wisconsin. Class 23.

219,920. **LUXITOL.** POWDER OR COMPOSITION FOR FACING OR COATING MOLDS FOR METAL CASTING IN FOUNDRY WORK. Registered Oct. 26, 1926. THE ALPHA-LUX COMPANY, INC., New York, N. Y., a corporation of New York. Renewed Oct. 26, 1946. Class 1.

219,935. **"ALL-PURE" AND DESIGN.** SOAP. Registered Oct. 26, 1926. ALLEN B. WRISLEY COMPANY, Chicago, Ill., a corporation of Illinois. Renewed Oct. 26, 1946. Class 4.

219,936. **STEMPEL.** FIRE EXTINGUISHER APPARATUS, INCLUDING PORTABLE HAND EXTINGUISHERS AND WHEELED EXTINGUISHERS. Registered Oct. 26, 1926. ROBINSON FIRE APPARATUS MANUFACTURING COMPANY, St. Louis, Mo. Renewed Oct. 26, 1946, to Herbert A. Greene, doing business as M. L. Snyder & Son, Philadelphia, Pa. Class 23.

219,937. **SUNSHINE.** PORTABLE AND HAND-OPERATED SPRAYERS AND PARTS THEREOF. Registered Oct. 26, 1926. HUDSON MFG. COMPANY, Minneapolis, Minn. Renewed Oct. 26, 1946, to H. D. Hudson Manufacturing Company, Chicago, Ill., a corporation of Minnesota. Class 23.

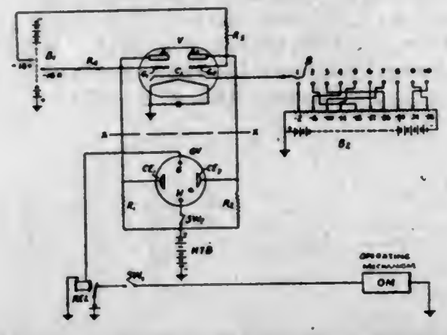
220,142. **FAMOUS FOOD OF VIRGINIA.** CAKES AND CRACKERS. Registered Nov. 2, 1926. SOUTHERN BISCUIT WORKS. Renewed Nov. 2, 1946, to Southern Biscuit Company, Incorporated, Richmond, Va., a corporation of Virginia. Class 46.

220,214. **TAVERN.** MALT SIRUP FOR FOOD PURPOSES, CHEESE, AND BUTTER. Registered Nov. 2, 1926. AUG. WAGNER COMMISSION CO., St. Louis, Mo. Renewed Nov. 2, 1946, to Joseph George Van Korngut, Conneaut Lake, Pa. Class 46.

220,365. **"B" AND DESIGN.** GRINDING WHEELS, CUTTING WHEELS. Registered Nov. 9, 1926. BAKELITE CORPORATION. Renewed Nov. 9, 1946, to Bakelite Corporation, New York, N. Y., a corporation of New Jersey. Class 4.

REISSUES

OCTOBER 1, 1946



22,794

ELECTRICAL CONTROL SYSTEM FOR AUTOMATIC TELEPHONE SYSTEMS

Gerald Deakin, New York, N. Y., assignor to International Standard Electric Corporation, New York, N. Y., a corporation of Delaware

Original No. 2,351,016, dated June 13, 1944, Serial No. 458,297, September 14, 1942. Application for reissue April 23, 1945, Serial No. 589,819

31 Claims. (Cl. 179—16)

1. An electrical control system comprising two current conducting means having different voltage-current characteristics such that for a predetermined voltage applied to them the difference between the magnitudes of the currents flowing through them is a maximum and for voltages either greater or less than said predetermined voltage the said current difference rapidly decreases, means for deriving from said currents a potential difference dependent upon said current difference, a control means arranged to be actuated only by a potential exceeding a predetermined value, and means for applying said potential difference to said control means.

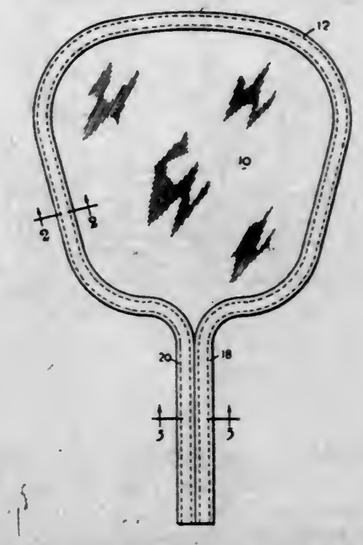
HIGH-FREQUENCY TUBE STRUCTURE

William W. Hansen, Russell H. Varian, and Sigurd F. Varian, Garden City, N. Y., assignors to The Board of Trustees of the Leland Stanford Junior University, Stanford University, Calif., a corporation of California

Original No. 2,311,658, dated February 23, 1943, Serial No. 343,528, July 2, 1940. Application for reissue January 29, 1944, Serial No. 520,353

30 Claims. (Cl. 315—6)

18. A grid structure for insertion in an aperture comprising a deformed integral strip of metal having alternate arcuate portions conforming to the perimeter of said aperture and of substantially the same curvature as said aperture perimeter, and also having intervening V-shaped portions projecting toward the center of said aperture.



22,796

COMBINATION FAN AND EYESHIELD

Harry A. Husted, St. Clair, Mich.

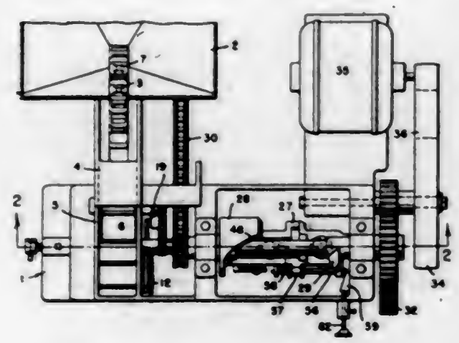
Original No. 2,392,671, dated January 8, 1946, Serial No. 590,804, April 28, 1945. Application for reissue May 17, 1946, Serial No. 670,334

5 Claims. (Cl. 230—266)

1. In a combination fan and eye shield comprising a relatively thin fan-shaped sheet of transparent material having the property of filtering objectionable light frequencies; an integral frame and handle secured to said sheet and comprising a continuous hollow tube of plastic material of length substantially greater than the periphery of said sheet and having a slot throughout its entire length substantially equal in width to the thickness of said sheet, said tube being of such shape as to completely surround said sheet, forming a rigid frame therefor; the margins of said sheet being received in said tube through said slot, and the excess length of said tube at its two ends extending substantially radially of said sheet in the plane thereof and being cemented together to form a handle.

22,797

NUT CRACKING MACHINE



Leon K. Maulsby and John A. McGrann, San Antonio, Tex., said McGrann assignor to said Maulsby

Original No. 2,319,820, dated May 25, 1943, Serial No. 433,412, March 5, 1942. Application for reissue September 29, 1943, Serial No. 504,322

1 Claim. (Cl. 146—12)

In combination, in a nut cracking machine, a drive shaft, a carriage in parallel alignment with said drive shaft, said carriage being mounted for longitudinal movement with relation to said drive shaft, a slide mounted in said carriage for longitudinal movement with relation to said carriage and said drive shaft, resilient means in-

terposed between said carriage and said slide tending to hold said carriage in one direction and said slide in the opposite direction, a cam on said drive shaft governing in combination with said resilient means the longitudinal movement of said slide, a second cam on said drive shaft disposed to engage a roller mounted in said carriage for imparting longitudinal motion to said carriage, locking means between said slide and carriage, said locking means consisting of a ring closely fitting the diameter of said slide and with a comparatively narrow axial bearing surface on said slide, an internal enlargement in said carriage for the reception of said ring, the internal ends of said enlargement being in perpendicular alignment with the axis of said slide

at one end thereof for holding the axis of said ring in alignment with the axis of said slide and the opposite end of said enlargement being provided with a shoulder engageable with one portion only of the periphery of said ring, means normally holding said ring in contact with said perpendicular end of said internal enlargement and securing true alignment of said ring with said slide and means opposed to said shoulder in said internal enlargement for moving that portion of said ring periphery out of engagement with the perpendicular end of said internal housing enlargement and into engagement with said shoulder to produce a mis-alignment between said ring and said slide whereby the action of said shoulder against the periphery of said ring will serve to lock said slide with relation to said carriage upon movement of said carriage.

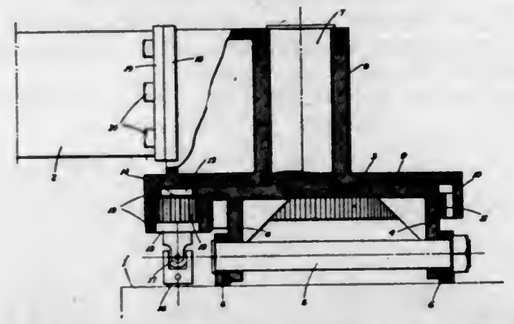
22,798
TOGGLE FASTENING MEANS FOR FLOATING CLOSURES
Herbert Wolcott, Columbia, Mo.
Original No. 2,342,095, dated February 15, 1944, Serial No. 359,886, October 5, 1940. Application for reissue February 15, 1945, Serial No. 578,068
5 Claims. (Cl. 220—57)

4. A closure structure comprising a body member having a closure seat, a movable cover member mounted in floating engagement with said seat and formed with a pair of spaced hook elements, and securing means including a cover actuating bar movable into and out of clamping engagement therewith, said bar being formed with a projection entering the space between said hook elements to prevent rotation of said cover member and also having a pair of lugs engageable with said hook elements for lifting said cover member on movement of said bar for releasing its clamping engagement with the cover member.

PLANT PATENTS

GRANTED OCTOBER 1, 1946

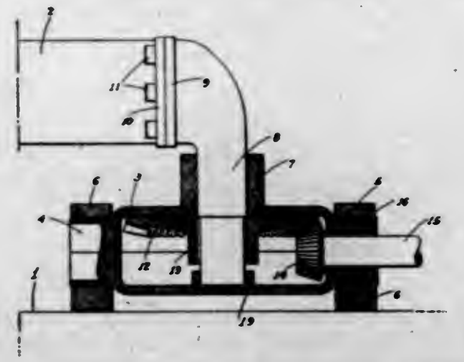
Owing to the fact that almost all of the illustrations of the plant patents are in colors, it is not practicable to print a cut of the drawing.



711
CHRYSANTHEMUM PLANT
Emil Prushek, Berrien Springs, Mich., assignor to The R. M. Kellogg Company, Three Rivers, Mich., a corporation of Michigan
Application November 28, 1945, Serial No. 631,249
1 Claim. (Cl. 47—60)

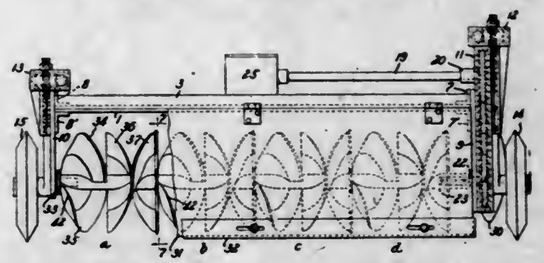
A new and distinct variety of chrysanthemum plant characterized as to novelty by the intense coloring of blossoms, and the very dwarf, compact, rather flat form of the plant, substantially as shown and described.

PATENTS



GRANTED OCTOBER 1, 1946

2,408,359
COUPLING AND STEERING UNIT
Richard Lawrence Akers, Peoria, Ill., assignor to R. G. Le Tourneau, Inc., Stockton, Calif., a corporation of California
Application June 29, 1945, Serial No. 602,346
10 Claims. (Cl. 180—79.4)

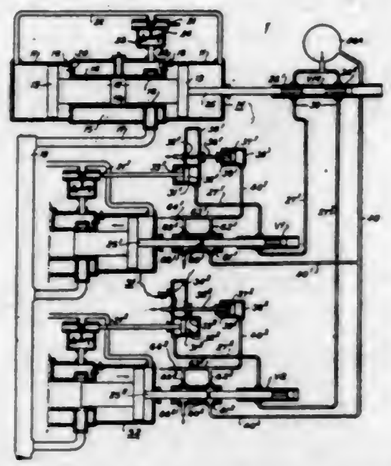


1. A tractor-trailer draft coupling and power steering unit comprising a pair of cooperating members secured together for relative rotation about an upstanding axis, means adapted to connect one member in fixed relation to the trailer, means adapted to connect the other member to the tractor for unitary lateral tilting of said members relative to said tractor about a longitudinal axis, a ring gear secured concentrically with said one member, a pinion carried by and journaled on the other member about a vertical axis and meshing with the gear, and drive means connected in driving relation to the pinion and operable to drive the latter regardless of the relative lateral tilt between the tractor and said unitary members.

2,408,360
DRAFT COUPLING AND POWER STEERING UNIT
Richard Lawrence Akers, Peoria, Ill., assignor to R. G. Le Tourneau, Inc., Stockton, Calif., a corporation of California
Application June 29, 1945, Serial No. 602,347
7 Claims. (Cl. 180—79.4)

1. A tractor-trailer draft coupling and power steering unit comprising a member adapted to be mounted on the tractor for relative lateral tilting about a longitudinal axis, a post adapted to be fixed in connection with the trailer, said post being mounted on and projecting from the member for relative rotation about an upstanding axis, a gear secured concentrically on the post, and a reversibly driven, shaft supported pinion in mesh with the gear, said pinion and laterally tiltable member being coaxial along the longitudinal axis of tilting of the latter.

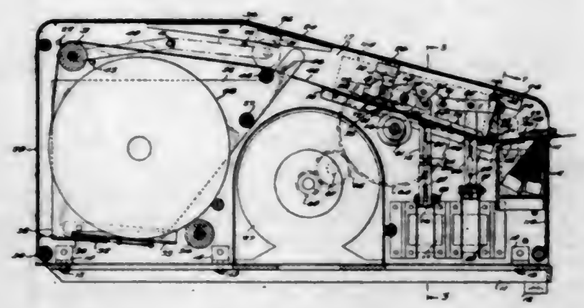
2,408,361
ROTARY TILLER
John Peter Bagan, Portland, Oreg., assignor of one-third to Anthony R. Wanasek, Marshfield, Oreg.
Application August 9, 1944, Serial No. 548,706
10 Claims. (Cl. 97—41)



1. A rotary spiral tiller comprising a frame, supporting wheels and draft means, a spiral cutter mounted for rotation on the frame in a position to engage the ground and means for driving the rotary cutter, said rotary cutter comprising at least one section having a central shaft and at least one pair of spiral blades mounted thereon in predominately non-overlapping relationship to each other longitudinally of the shaft and oppositely pitched to move material toward each other when the cutter is rotated so that the forward edges thereof move downwardly as the cutter is moved forwardly, each blade extending substantially 180° around the shaft and the adjacent ends of the blades being equally spaced circumferentially of the shaft and the adjacent ends of blades of opposite pitch alternating with each other around the shaft.

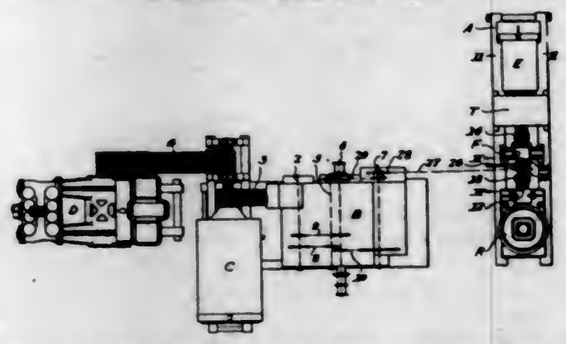
2,408,362
OSCILLATING FLUID-DISPLACING MACHINES OPERATING IN PARALLEL
Evelyn Stewart Lansdowne Beale, Staines, England, assignor to Alan Muntz & Company Limited, Hounslow, England, a company of Great Britain
Application November 17, 1943, Serial No. 510,638
In Great Britain November 25, 1942
15 Claims. (Cl. 60—97)

1. A combination of at least two oscillatory fluid-displacing machines arranged to operate in parallel on a common main and provided with means for maintaining automatically a predetermined phase relationship between them, said means including a source of fluid under pressure, a device actuated by one of said machines which serves as a master for interrupting the flow of said pressure fluid synchronously only once per cycle of said master machine, a device actuated by the other of said two machines which acts as a slave, said slave device being connected to receive the interrupted flow of pressure fluid passed by said master device and serving for interrupting the flow of pressure fluid synchronously only once per cycle of said slave machine, the arrangement being such that, when said pre-



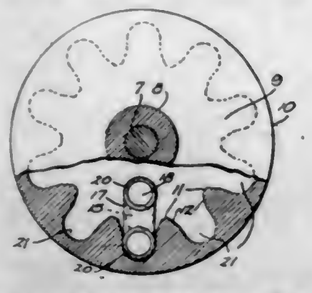
determined phase relationship exists, there is an overlap between the non-interrupting periods of said two devices, and a controller for varying the period of oscillation of said slave machine, in

response to variation in the mean rate of flow of pressure fluid passed by said two devices in series, in such a sense as to eliminate departure from said predetermined phase relationship.



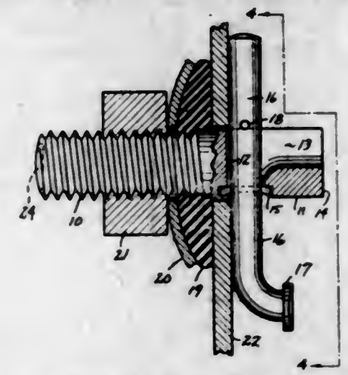
11. A free-piston fluid-displacing machine intended for operation in predetermined phase relationship in parallel with other like machines on a common main and having a controller for varying the period of oscillation of its free pistons, means for conducting a variable supply of fluid under pressure for actuating said controller, and a device having an oscillatory member connected for movement in synchronism with said free pistons and serving to interrupt synchronously the flow of pressure fluid through said conducting means, and means for adjusting the non-interrupting period of said device automatically in response to variation in at least one of the dead points of said free pistons so as at least to reduce the effect of variation of the length of the free-piston stroke on the ratio of said non-interrupting period to the period of oscillation of said free pistons.

2,408,363
ELECTRICALLY CONTROLLED STRIP SERVING MACHINE
Charles E. Beckman and Earl B. Dodds, Chicago, Ill., assignors to Better Packages, Inc., Shelton, Conn., a corporation of New York
Application May 9, 1942, Serial No. 442,386
32 Claims. (Cl. 164—49)



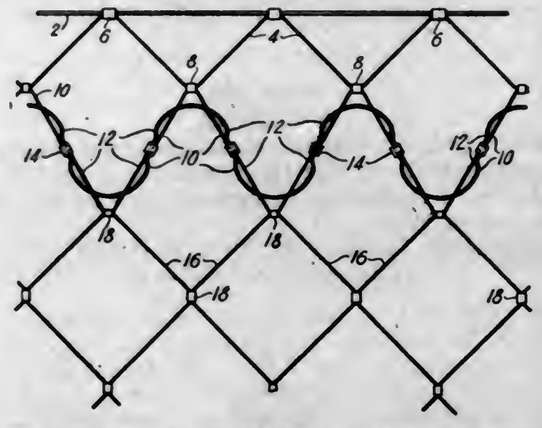
1. An apparatus for feeding measured strips of tape, a pair of feed rolls to feed the tape, a constant speed motor for driving at least one of said rolls in tape feeding direction, said rolls being mounted for relative movement into and out of tape feeding relation, and electrical means for controlling the delivery of strips of tape of predetermined length, said means including a feeder circuit, a timing circuit and a stop circuit, said feeder circuit having instrumentalities for bringing said tape feeding elements into tape feeding relation when said circuit is energized, said timing circuit being coordinately energized with said feeder circuit, said timing circuit completing said stop circuit after a given predetermined interval of time comparable to a given predetermined length of tape and said stop circuit having means to break said feeder circuit whereby said feed rolls are removed from tape feeding relation and feed of tape ceases.

2,408,364
ROTARY DRILLING UNIT
Daniel A. Bennett and August R. Maier, Oil City, Pa., assignors to Oil Well Supply Company, a corporation of New Jersey
Application March 30, 1942, Serial No. 436,908
1 Claim. (Cl. 255—19)



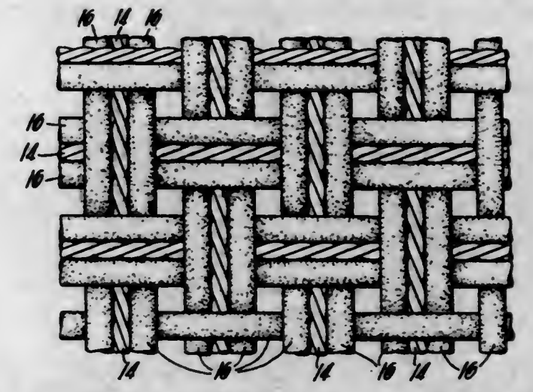
In a rotary drilling unit, the combination with a rotary, of a prime mover therefor, connecting shafting between said rotary and prime mover, and an auxiliary drive for the transmission of power to and from the unit comprising a pair of spaced couplings disposed in said connecting shafting and adapted to separately interrupt the transmission of power from the prime mover to the rotary, a transmission member freely rotatable on the portion of said connecting shafting between said couplings, and means for selectively connecting the transmission member to said portion of the connecting shafting.

2,408,365
SELF-LOCKING GEARING
Fred Biehl and Edward O. Thompson, Peshtigo, Wis.; said Biehl assignor to said Thompson
Application January 31, 1944, Serial No. 520,396
3 Claims. (Cl. 74—413)



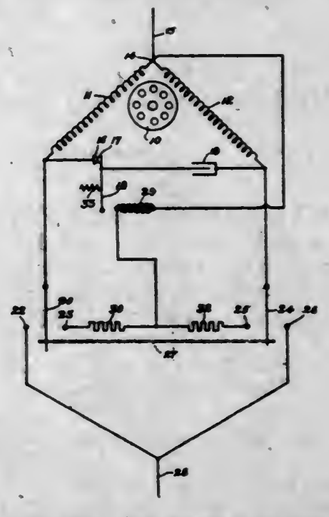
1. In a self-locking gear set, the combination with a pinion comprising a head rotatable upon a predetermined axis and provided at points spaced from said axis with axially projecting stud teeth revoluble about said axis in the rotation of said head, in combination with a ring gear mounted for rotation about a predetermined axis and in a plane which includes said pinion stud teeth, said ring gear comprising an annular series of inwardly projecting teeth with which the stud teeth of the pinion mesh, the ring gear teeth being spaced to provide interdental openings diverging substantially on radii of the ring gear and into which alternate teeth of the pinion are successively receivable, each ring gear tooth having inwardly converging beveled faces, said faces being so positioned as to correspondingly and simultaneously engage opposite teeth of the pinion when such teeth are disposed in a position such that a line drawn between them will lie substantially at right angles to a radius of the ring gear.

2,408,366
TOGGLE BOLT
Hugh N. Boyer, near Canfield, Ohio
Application March 20, 1945, Serial No. 583,712
2 Claims. (Cl. 85—3)



1. In a fastener, a partially threaded body member adapted for insertion through openings in articles to be fastened, a nut threaded on said threaded body member, an opening formed transversely in the unthreaded portion of the said body member, and a slot formed between the said opening and the unthreaded end of the said member, a toggle having a curved headed end freely positioned in said opening and pin means inwardly from the other end of said toggle for limiting its movement with respect to the said body member.

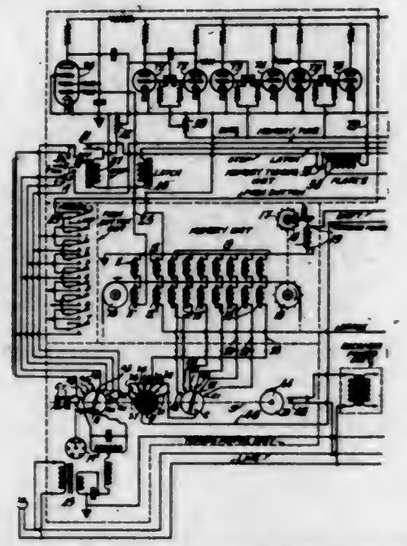
2,408,367
TORPEDO NET
Alan E. Brickman, New Haven, Conn., assignor to The American Steel and Wire Company of New Jersey, a corporation of New Jersey
Application March 6, 1945, Serial No. 581,309
4 Claims. (Cl. 114—241)



1. A torpedo net structure or the like comprising a rope, a mesh structure connected to said rope, said mesh structure being formed of a plurality of wire structures arranged in a zigzag manner with the apices of adjacent wire structures being connected by slip connections, and a shock absorbing seam between the rope and mesh structure, the shock absorbing seam giving under less stress than the connections in the mesh structure.

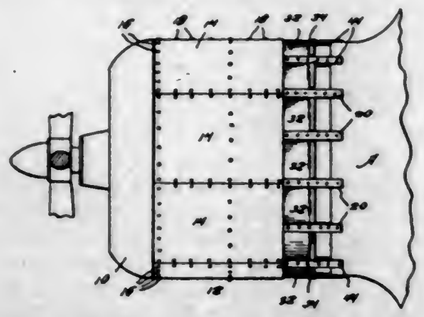
2,408,368
WIRE REINFORCED FABRIC
Alan E. Brickman, New Haven, Conn., assignor to The American Steel and Wire Company of New Jersey, a corporation of New Jersey
Original application January 8, 1943, Serial No. 471,755. Divided and this application July 14, 1945, Serial No. 605,053
8 Claims. (Cl. 139—420)

1. A wire reinforced fabric comprising a plurality of threads arranged in a plain weave, each of said threads having a stranded wire structure between latex coated cords.



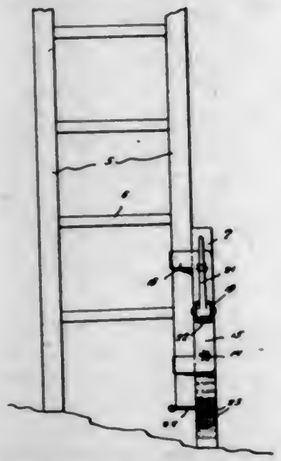
2,408,369
MOTOR CONTROL
Cornelius Brongersma, Muskegon Heights, Mich., assigner to Manning, Maxwell & Moore, Inc., Muskegon, Mich., a corporation of New Jersey
Application April 13, 1944, Serial No. 530,878
6 Claims. (Cl. 172—279)

1. In a control for effecting quick reversal of a single phase alternating current motor including a rotor, a pair of displaced field windings connected together at one end and having different characteristics, the combination of a power supply line lead connected to the connected ends of the field windings, a starting circuit control relay having an electromagnetic actuating winding, a second power supply line lead, switching means for selectively alternating the connection of the other ends of the field windings to said second power supply line for effecting selective reversal of the rotor rotation, said switching



means having contacts for coincidentally effecting selective alternations of the field winding to which said electromagnetic actuating winding is connected, and compensating means in the circuit of said electromagnetic actuating winding providing compensation for the difference of characteristics of said field windings.

2,408,370
AUTOMATIC TUNING SYSTEM FOR RADIO RECEIVERS
Charles M. Burrill, Princeton, N. J., assignor to Radio Corporation of America, a corporation of Delaware
Application February 26, 1943, Serial No. 477,209
17 Claims. (Cl. 250—20)

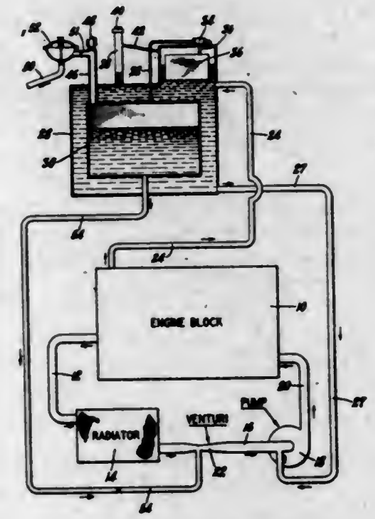


1. The method of effecting the automatic tuning of a radio receiver to selected stations according to a predetermined schedule, which consists in causing during the reception period of each tuned-in station the automatic production of a characteristic electro-magnetic recording which is different for each tuned-in station, and thereafter causing said electro-magnetic recordings to automatically control the operation of the receiver in accordance with said predetermined schedule.

2,408,371
COWLING FOR AIRPLANES
David M. Capanoli, now by judicial change of name David Marino Cappan, Hibbing, Minn.
Application November 8, 1944, Serial No. 562,475
1 Claim. (Cl. 123—171)

In combination with an engine, a front annular cowling encircling said engine, a substantially cylindrical cowling extending rearwardly in continuation of said front cowling, said cylindrical cowling being made up of a plurality of arcuate sections, a cockpit cowling rearwardly of and spaced from the rear end of the cylindrical cowling, oppositely channelled track elements underlying the adjacent side edges of said sections and secured thereto and extending across the space between the rear ends of the sections and the cockpit cowling, and arcuate shutters slidable in said track elements to close and open said space to regulate the air flow through said cowlings, said shutters being of sheet metal and each joined at its front edge to the adjacent portion of a plate clearing said track elements and also including a portion angularly spaced from the shutter and attached at its rear end to the shutter, and jack units each pivotally secured to the plate of a shutter and simultaneously operated.

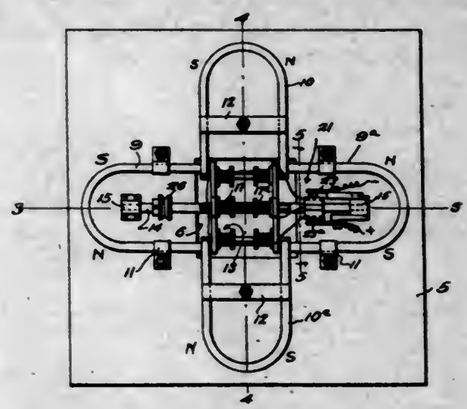
2,408,372
LADDER EXTENSION
Jesse De Forest Chase, Kansas City, Mo.
Application November 10, 1944, Serial No. 562,815
2 Claims. (Cl. 228—63)



1. A ladder extension comprising an elongated member adapted for placing against one side of a ladder rail, a pair of stationary U-shaped clamping plates secured in vertically spaced relation to said member and adapted to receive an edge of both the ladder rail and said member for relative sliding movement and to secure the member against lateral movement from the rail as well as against forward or rearward tilting movement on the rail, a movable clamping plate carried by the member, cam means engaging said movable plate and adapted for moving the movable clamping plate into clamping engagement with an opposite edge of the ladder rail, and spring means yieldably urging the movable clamping plate out of clamping engagement.

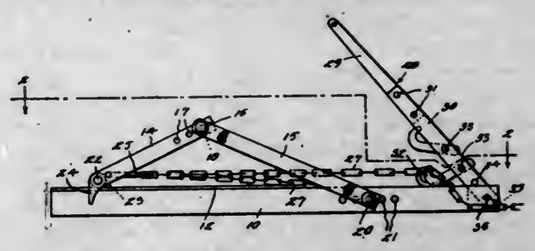
2,408,373
ANTENNA
Lan Jen Chu, Brookline, Mass., assignor, by mesne assignments, to the Government of the United States of America, as represented by the Secretary of War
Application January 13, 1945, Serial No. 572,723
3 Claims. (Cl. 250—11)

3. An antenna for radio communication systems having, in combination, means for radiating high frequency energy, a reflector for directing the radiant energy, said reflector comprising a plurality of sections normally forming a paraboloid, means for pivotally supporting some of said sections, and means for tilting at least one of said sections relative to the principal axis of said reflector.



2,408,374
COOLING SYSTEM FOR INTERNAL-COMBUSTION ENGINES
Leo J. Clapsadle and James C. Kratzer, Kenmore, and Eric E. Sommer, Larchmont, N. Y., assignors to The Linde Air Products Company, a corporation of Ohio
Application November 11, 1943, Serial No. 509,840
11 Claims. (Cl. 123—174)

9. A liquid cooling system for internal combustion engines comprising a primary circulation line including the engine block, a radiator, a coolant pump, and a venturi before the intake to said pump; an expansion tank connected to permit at least partial circulation of effluent engine block coolant; a static coolant reserve tank within said expansion tank and in heat exchange relationship with the coolant therein; a connection from said static tank to the throat of said venturi through which liquid head pressure of the static tank coolant is impressed on the system; a connection between said expansion tank and said static coolant reserve tank adapted readily to permit venting of air and vapor from the former to the latter tank and to resist similar flow of liquid; and pressure venting means on said static coolant reserve tank to control the vapor pressure therein while preventing an equalization of pressure with the outside atmosphere.

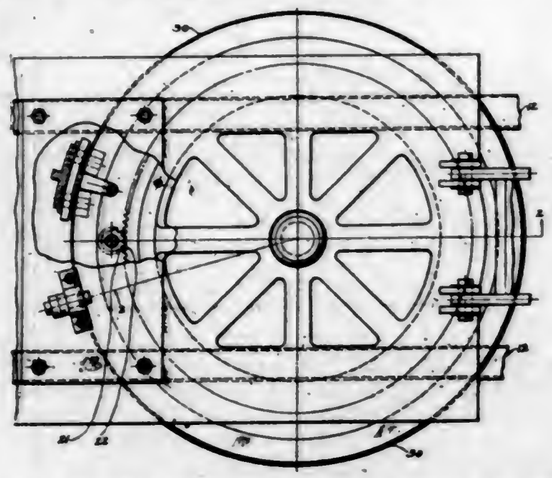


2,408,375
MAGNETIC MOTOR
Clarence P. Collins, Titusville, Pa.
Application April 27, 1944, Serial No. 533,013
7 Claims. (Cl. 172—36)

1. In a magnetic motor, the combination of two pairs of opposed permanent magnets arranged in cross formation, of an armature mounted for rotation about an axis located between and extending transversely of the permanent magnets of one pair, said armature including peripheral electromagnets having cores disposed parallel with the axis of rotation of the armature and having their ends arranged to move adjacent but inwardly of and past the ends of the permanent magnets of said one pair as the armature rotates, said electromagnets being arranged in the same plane and electrically connected in series, and a commutator comprising means for alternately energizing and

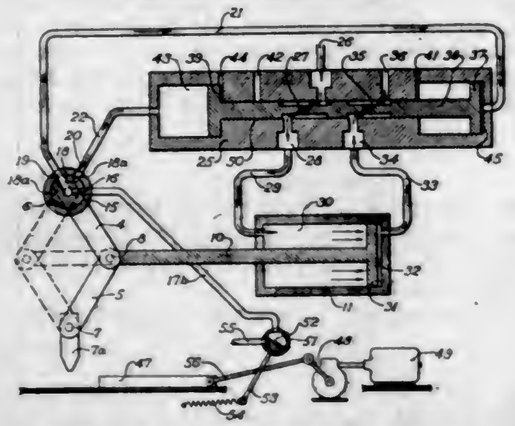
de-energizing the pairs of electromagnets, whereby the armature is driven by the alternate action thereon of the repelling force of the electromagnets and the attracting force of the permanent magnets.

2,408,376
AUTOMOBILE JACK
Charles C. Craig, Morrill, Nebr.
Application December 23, 1943, Serial No. 515,442
4 Claims. (Cl. 254—127)



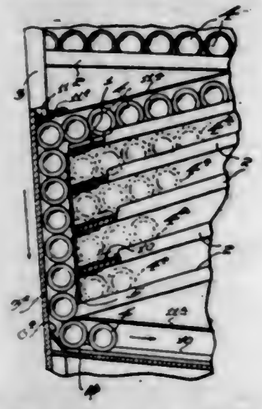
1. A jack of the class described comprising an elongated base, a lever pivoted to the base, a lever pivoted to the first-mentioned lever above the base, means carried by the second-mentioned lever to travel along the base, and means associated with the base operable to draw the second-mentioned lever toward the fulcrum of the first-mentioned lever to elevate them at their junction, and guard means on the second-mentioned lever extending therefrom below the upper surface of the base, said means on the second-mentioned lever movable on the base being a roller, a wear-plate on the base along which the roller moves, said means to actuate the levers consisting of a pair of draw elements extending from the second-mentioned lever, an operating lever on the base having hook means engageable with one of the draw elements, and an anchoring hook on the base engageable by the other draw element.

2,408,377
POLYVINYL ALCOHOL COMPOSITION
Charles Dangelmajer, Nutley, N. J., assignor to Resistoflex Corporation, Belleville, N. J., a corporation of New York
No Drawing. Application May 1, 1942,
Serial No. 441,275
6 Claims. (Cl. 260—36)



1. A normally flexible plasticized polyvinyl alcohol composition containing as a thermostabilizing agent a substance selected from the group consisting of the chlorides of aluminum and tin.

2,408,378
STABILIZER ATTACHMENT FOR CRANES
James E. Davenport and Leonard J. Quinn, Richmond, Calif.; said Quinn assignor to said Davenport
Application June 8, 1944, Serial No. 539,376
6 Claims. (Cl. 212—70)

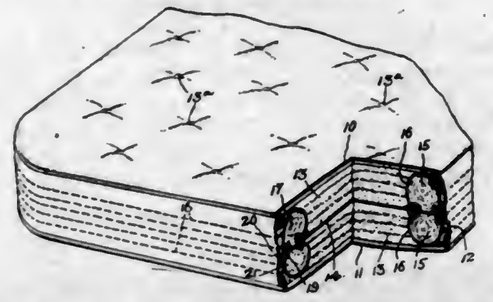


1. In a portable crane having a turntable with a top member mounted for rotation on a centerpin and providing a support for the crane boom adjacent the outer periphery of said member and a carrier with a frame underlying said member and having a support thereon for said pin and a peripheral bearing for supporting said member at said boom supporting portion, a circular track fixedly mounted on said frame and surrounding said bearing in concentric relation to said pin and provided with a substantially horizontally disposed undersurface with a free side edge and a vertical inner surface, a hanger depending from said member at a portion in substantially diametrically opposed relation to the portion supporting the boom and alongside of said free edge, a roller on said hanger positioned to engage and ride on said track surface to cooperate with said pin and the support therefor to prevent tilting of said member toward said boom supporting portion and a part on said hanger positioned to engage said inner track surface opposite the free side edge and hold the hanger against displacement radially of the track.

2,408,379
PRESS
Luther F. Day, Hawthorne, Calif., assignor to North American Aviation, Inc.
Application August 7, 1944, Serial No. 548,383
1 Claim. (Cl. 100—70)

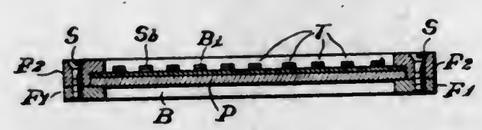
In a press, a frame, a ram adapted to have linear reciprocating movement with reference to said frame, a toggle comprising a pair of arms pivotally joined to each other, the remote ends of one of said arms being attached to a trunnion member which is journaled in said frame, the remote end of the other arm being pivoted to said ram, a double acting pneumatic servo motor linked to the pivotal joint between said arms, air circulating means for delivering air under pressure to one end of said servo motor while exhausting air from the opposite end thereof, and means for reversing the flow in said circulating means at predetermined limits of reciprocating movement of said servo motor, comprising a valve having an oscillating valve element comprising an extension of said trunnion and receiving movement therefrom.

2,408,380
BOTTLE DISPENSING APPARATUS
Luther D. Dennis, Comanche, Okla., assignor, by mesne assignments, to Portable Elevator Mfg. Co., Bloomington, Ill., a corporation of Illinois
Application July 26, 1943, Serial No. 496,205
1 Claim. (Cl. 312—48)



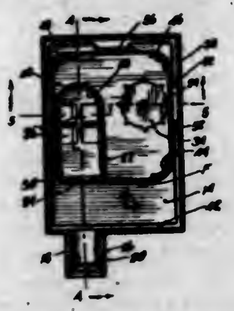
In a bottle dispensing apparatus, a bottle compartment comprising a plurality of tiers of bottle dispensing chutes arranged one above the other, successive tiers being oppositely inclined, each tier including a plurality of parallel bottle chutes, the lowest chute of each upper tier communicating at its lower end with the upper end of the uppermost chute of the tier beneath, and a vertical chute connecting the lower ends of the chutes of each upper tier with the upper end of the upper chute in the tier below.

2,408,381
RESILIENT FILAMENTS
Frederick G. Dodge, La Vale, Md., assignor to Celanese Corporation of America, a corporation of Delaware
No Drawing. Application October 6, 1943, Serial No. 505,165
7 Claims. (Cl. 8—131)



1. Process for the production of voluminous, permanently crimped artificial staple fibers, which comprises immersing relaxed, unstretched and unassociated dry-spun staple fibers, having a basis of an organic derivative of cellulose and prepared from filaments spun without any tension being exerted thereon, in an aqueous liquid medium containing a water-soluble swelling agent having at least a softening action on the organic derivative of cellulose, removing excess liquid from the staple fibers, immersing the staple fibers in water at a temperature of about 150 to 160° F., removing the water from the staple fibers and drying the staple fibers, whereby voluminous, permanently crimped staple fibers are produced.

2,408,382
MATTRESS
Michael Dubick, Chicago, Ill., assignor to The Englander Company, Inc., Chicago, Ill., a corporation of Delaware
Application August 9, 1943, Serial No. 497,912
4 Claims. (Cl. 5—360)

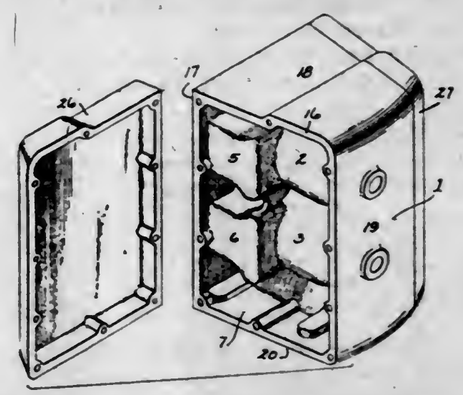


1. In a mattress, the combination of spaced cover members, a border member secured to said cover members and extending therebetween, an intermediate sheet dimensioned to extend through the mattress between and substantially parallel to said cover members, a pair of elongated rolls extending lengthwise along the inner surface of said border member at opposite sides of said sheet, and means for securing said rolls and said intermediate sheet jointly to said border member.

2,408,383
ELECTRIC DISCHARGE DEVICE
John Evans, Palmyra, N. J., assignor to Radio Corporation of America, a corporation of Delaware
Application August 30, 1941, Serial No. 408,961
6 Claims. (Cl. 250—167)

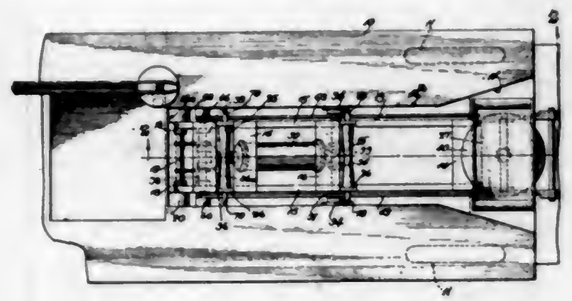
1. An image cathode adapted to respond to rays below the visible spectrum, said cathode comprising an electrically conducting surface having a multiplicity of discrete elemental areas thereon formed of a plurality of superimposed layers constituted of different metals selected from the thermoelectric series.

2,408,384
FILM VIEWING DEVICE
Robert W. Farrell, New York, N. Y.
Application January 20, 1945, Serial No. 573,651
2 Claims. (Cl. 88—17)



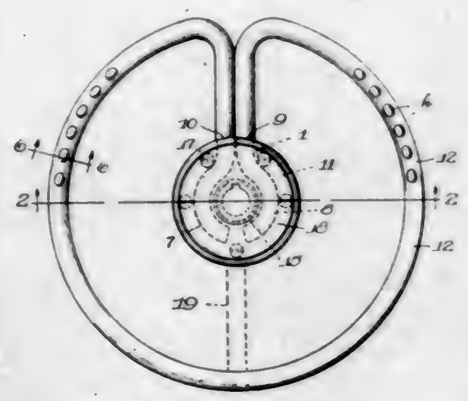
1. A film viewing device comprising a casing having a removable cover at one side thereof, means within said casing for mounting an endless film insertable edgewise into said casing through the open side thereof when the cover is removed, a light compartment within said casing and positioned therein so that the film travels around said light compartment externally thereof when said film is moved for the viewing of successive portions thereof, said light compartment having a light outlet opening closed by the film when the latter is mounted in said casing, said compartment having a peripheral wall extending in the direction of the width of the film and laterally between said cover and the side of said casing which is opposite said cover, said light-compartment having a light-inlet opening in the plane of one of said sides of the casing, said casing having a peripheral wall provided with a viewing opening in registry with said light outlet opening in spaced relation thereto, and means for moving said film across said openings in the space therebetween.

2,408,385
DRILL LUBRICANT
Edmund L. Flood, San Diego, Calif., assignor to Consolidated Vultee Aircraft Corporation, San Diego, Calif., a corporation of Delaware
No Drawing. Application April 16, 1945, Serial No. 588,733
9 Claims. (Cl. 252—41)



1. A drill lubricant composition comprising, on a weight basis, from 45 to 52% of a soda base grease, 38 to 43% of paraffin wax having a melting point of at least about 143° F., 8 to 12% of turpentine and 0.25 to 0.5% of aluminum stearate.

2,408,386
ENGINE AND ENGINE COOLING METHOD
John F. Furry, Galesburg, Ill., assignor to Outboard Marine & Manufacturing Company, Galesburg, Ill., a corporation of Delaware
Application November 4, 1944, Serial No. 561,956
19 Claims. (Cl. 123—173)

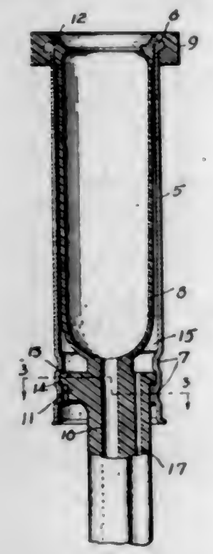


7. In an engine, the combination with a plurality of horizontal cylinders having intake manifold means at one side and exhaust means at the other, of a jacket faced to provide a crank case connection for said cylinders and extending above said cylinders and across their ends and beneath said cylinders back to said connection, partition webs connecting the jacket with the top of the upper cylinder and with the bottom of the lower cylinder, said partition webs being ported above and below the cylinders to afford restricted communication between jacket cavities at opposite sides thereof, a removable closure for a jacket cavity at the intake side of the cylinders, said closure embracing said manifolds, a jacket closure for the cavity at the exhaust side of said cylinders, and means for supplying coolant to the last mentioned cavity and discharging coolant therefrom.

2,408,387
TIMBER SETTING MACHINE
Harry S. Gay, Mount Gay, and Thomas V. Maynard, Williamson, W. Va.
Application February 1, 1945, Serial No. 575,706
9 Claims. (Cl. 214—130)

1. A timber setting machine comprising a truck having a flat bed provided with an elongated slot extending longitudinally of and through the bed with one end opening through the rear end of the bed of the truck, a hoisting arm normally housed within the slot, means pivotally mounting the inner end of the arm within the inner end of said slot, means for raising the free end of the arm, a saddle pivotally mounted on the free end of said arm and adapted to receive and support a timber, a seat at the outer end of the slot and supporting the saddle in a horizontal position, and a rod having a bent end pivoted on a side wall of the slot, the other end of said rod having pivotal connections with the saddle so that when the arm is raised the saddle will be maintained in a horizontal position.

2,408,388
STEERING WHEEL
Harry F. George, Chicago, Ill.
Application February 12, 1944, Serial No. 522,049
1 Claim. (Cl. 74—552)

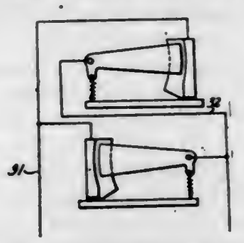


In a steering wheel, an elongated metal tubular rim having a circular portion and inwardly extended end portions, means for detachably securing said end portions together, said rim having an elongated slot in its bottom side, and a yieldable ornamental thermoplastic resin covering snugly fitting around the exterior surface of the rim, said covering having in its bottom wall an elongated rib fitting into the slot of the rim, and being of a nature enabling pulling it longitudinally over the rim.

2,408,389
N,N-DIETHYLBENZAMIDE AS AN INSECT REPELLENT
Samuel I. Gertler, Washington, D. C., assignor to United States of America, as represented by Secretary of Agriculture
No Drawing. Application September 4, 1944, Serial No. 552,665
4 Claims. (Cl. 167—30)
(Granted under the act of March 3, 1883, as amended April 30, 1928; 370 O. G. 757)

1. An insect repellent composition comprising N,N-diethylbenzamide incorporated in a carrier selected from the group consisting of a dusting powder and a suitable non-toxic solvent.

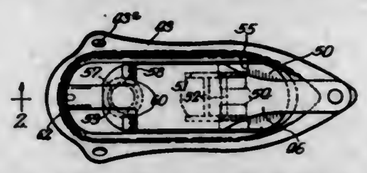
2,408,390
TEAT CUP FOR MILKING MACHINES
Frederick A. Gessler, Des Moines, Iowa, assignor, by mesne assignments, to Globe Milker, Inc., Des Moines, Iowa, a corporation of Illinois
Application December 29, 1944, Serial No. 570,436
4 Claims. (Cl. 31—85)



1. In a teat cup, the combination with a tubular casing of cylindrical shape having a peripheral bead at on end, and axially spaced, inwardly extended annular ridges adjacent its opposite end, of an integrally formed flexible liner having an enlarged head portion with an annular undercut recess adapted to receive said peripheral bead, and including a base member comprised of a milk tube, a pulsation tube and an annular projection, said projection comprising two portions of different thicknesses transversely of the liner, with the portion of greater thickness having a diameter substantially equal to the inner diameter of said casing so that the peripheral edges thereof is adapted to abut against one of said annular ridges, and the portion of lesser thickness constituting a reinforcing structure to prevent undesirable distortion of the projection when in operative position with one of said ridges, with said two tubes being terminated substantially at said projection and extended therethrough.

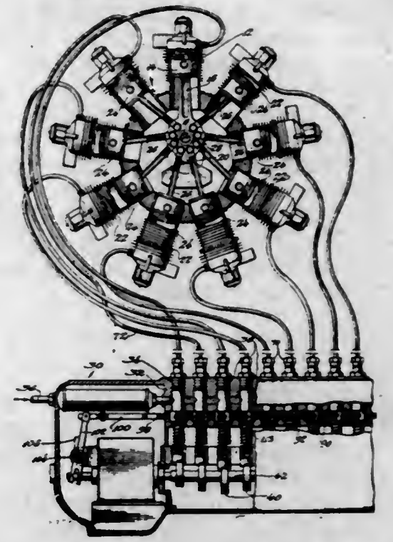
4. In a teat cup of the type described comprising a tubular outer casing of a straight cylindrical shape having the openings a the opposite ends thereof of substantially the same size, and an inner flexible liner which is maintained in operative position relative to the casing by friction means, said friction means comprising a series of parallel beads on said casing adjacent one end thereof, an annular projection on the liner having a diameter substantially equal to the inner diameter of said casing, and a peripheral portion on said projection adapted to frictionally engage a side surface of one of said beads to hold the liner in operative position within the casing.

2,408,391
KETONE AMINOINDAN CONDENSATION PRODUCT
Carlin F. Gibbs, Cuyahoga Falls, Ohio, assignor to The B. F. Goodrich Company, New York, N. Y., a corporation of New York
No Drawing. Application January 11, 1944, Serial No. 517,901
9 Claims. (Cl. 260—283)



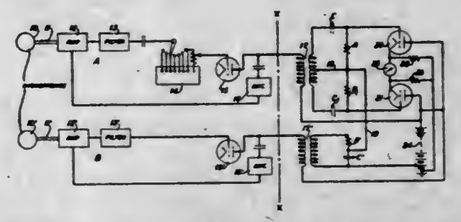
1. The product obtained by condensing a ketone with a primary aminoindan in the presence of an acidic condensation catalyst, said aminoindan having the amino group directly attached to a carbon atom of the aromatic ring and having a hydrogen atom attached to at least one of the adjacent nuclear aromatic carbon atoms.

2,408,392
VIBROMETER
Donald E. Gillum, Hermosa Beach, and Charles J. Gallant, Brentwood Heights, Calif., assignors to North American Aviation, Inc., Inglewood, Calif., a corporation of Delaware
Application November 29, 1941, Serial No. 421,078
5 Claims. (Cl. 177—311)



1. A vibrometer comprising a base adapted to be placed adjacent a vibrating body, a pair of variable condensers connected in parallel mounted on said base and including a pair of stators and a pair of rotors, and means for seismically supporting the rotors with respect to the stators so that vibrations transmitted to the base will produce relative movement of the rotors the stators and rotors being so positioned that vibrational forces in a direction perpendicular to the plane of the base cause the capacities to increase or decrease simultaneously while torsional vibrations will increase the capacity of one condenser when decreasing the capacity of the other.

2,408,393
FLASHLIGHT
Joseph A. Gits and Jules P. Gits, Chicago, Ill.
Application January 20, 1944, Serial No. 518,942
20 Claims. (Cl. 200—60)

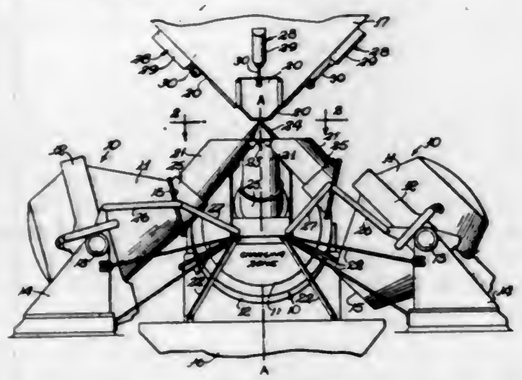


1. In a device of the class described, a waterproof casing, electric conductors therein arranged for connection with opposite terminals of a source of current supply housed in said casing and having portions in close proximity with each other, and switching means including contacts to make and break the circuit between said portions said contacts being exposed externally of said casing, a flexible waterproof layer overlying said contacts and in waterproof relation with said casing, and operating mechanism on the exterior of the casing to operate said contacts by pressure through said flexible layer.

2,408,394
DIESEL ENGINE AND METHOD OF OPERATING SAME
Constantine N. Guerasimoff, Harvey, Ill., assignor to The Buda Company, Harvey, Ill., a corporation of Illinois
Application December 23, 1942, Serial No. 469,854
9 Claims. (Cl. 123—55)

4. That method of eliminating over-heating of the master cylinder of a multi-cylinder fuel injection engine having a master connecting rod assembly, which comprises reducing the fuel supply to the master cylinder, increasing the fuel supply to the other cylinders by an amount sufficient to compensate for the reduced power of the master cylinder, and maintaining the same relationship between the quantity of fuel supplied to the master cylinder and the quantity of fuel supplied to each of the other cylinders throughout all conditions of engine operation.

2,408,395
OBJECT LOCATING SYSTEM
James B. Hays, Jr., Summit, N. J., assignor, by mesne assignments, to Western Electric Company, Incorporated, New York, N. Y., a corporation of New York
Application April 26, 1944, Serial No. 532,697
5 Claims. (Cl. 177—386)



1. A system for indicating the direction of an object from which wave energy emanates, comprising spaced receivers adapted to translate said wave energy into electrical energy, an electrical channel for each of said receivers respectively,

means for producing a phase shift of substantially 90 degrees between the signal voltages in said respective channels, means for combining said signal voltages to obtain sum and difference vectors, said last means comprising a pair of electron tubes each including a control grid, a cathode, and an anode, and circuit means for connecting both control grids to said phase shift means, each anode to the other, and each cathode to the other through a pair of serially connected resistors whose common junction point is at ground potential, and means for variably delaying transmission in one of said channels.

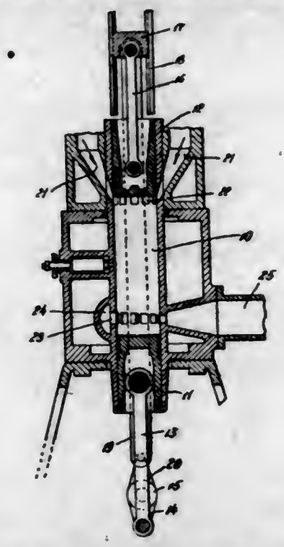
2,408,396
PROCESS FOR ACTIVATING CATALYSTS
George Frederick Horsley, Norton-on-Tees, England, assignor to Imperial Chemical Industries Limited, a corporation of Great Britain
No Drawing. Application May 8, 1944, Serial No. 534,694. In Great Britain April 29, 1943
11 Claims. (Cl. 252—239)

5. A process for the activation of platinum-containing catalysts suitable for the oxidation of sulphur dioxide to sulphur trioxide comprising treating the catalyst at a temperature not exceeding 20° C. with an aqueous solution prepared by the interaction of sulphur dioxide and metallic iron in the presence of water.

2,408,397
MIXING PLANT
Charles H. Johnson, Champaign, Ill., assignor to The C. S. Johnson Company, Champaign, Ill., a corporation of Illinois
Application September 18, 1941, Serial No. 411,362
5 Claims. (Cl. 259—152)

1. A concentric zone concrete mixing plant comprising, in combination, a battery of three or more mixers each having a charging opening therein and all disposed with said openings facing generally inward toward a common center, a plurality of stationary charging chutes leading upwardly and inwardly from points adjacent the charging openings of corresponding ones of said mixers to points adjacent a vertical axis coincident with said common center, all of said charging chutes terminating in open upper ends or mouths lying substantially in a common horizontal plane, an aggregate collecting hopper disposed above said chutes and shaped to taper downwardly to a small lower end located substantially on said axis, said hopper having a plurality of outlet openings distributed circumferentially about its lower portion and disposed in alinement with the upper ends of respective ones of said chutes, individually operable closures for said outlet openings, and an upwardly projecting baffle structure disposed beneath the lower end of said hopper and centrally between the upper ends of said chutes, said baffle presenting side faces sloping downward toward the mouths of respective ones of said chutes.

2,408,398
MULTIPLE EXTRUSION
Theodore L. Johnson, St. Louis, Mo.
Application July 24, 1943, Serial No. 496,258
20 Claims. (Cl. 18—13)



6. In plastic extrusion apparatus for forming a composite elongate article, an extrusion nozzle, means for supplying the nozzle with a plastic material under pressure, a passageway beyond the nozzle, and a combined cutoff gate and charging device for insert elements arranged for movement substantially crosswise of the passage, the gate adapted periodically to interrupt the flow of plastic material therethrough, and to bring an insert element into the line of flow in said passageway, and means for causing an effective actuation of said gate element, in response to a predetermined extent of movement of the plastic material through said passageway, said gate element being formed and normally positioned to permit a substantially uninterrupted flow through the passageway between the periods of said interruption of flow.

18. The herein described method of forming, as a subtantially continuous process, capped, cored, rod-like elements, each of predetermined length, which method consists in simultaneously extruding into a common forming passageway, a self-hardening plastic material to form the bodies of the elements, and a plastic material to constitute the cores of the elements, in the form of a material of self-hardening characteristics, and periodically, responsive to a predetermined length of flow of the body-forming materials through said passageway, introducing a cap element into said passageway, keying the cap element to the body of plastic in the passageway while the body is in plastic state, and timing the insertion of said cap element into said passageway, responsively to length of flow of material forming the bodies of the elements, in said passageway.

2,408,399
INTERNAL-COMBUSTION ENGINE
Michel Kadenacy, Summit, N. J.
Application November 3, 1944, Serial No. 561,689
9 Claims. (Cl. 123—51)

7. In an internal combustion engine of the two-cycle type having a cylinder and a piston, the combination of inlet means admitting gases into the cylinder, exhaust means including ports in the cylinder wall arranged in a circumferential series, a chamber encircling the cylinder at the ports and in communication with the ports, and an exhaust pipe leading from one end of the chamber, the exhaust ports being formed to direct the shock transmitted to the gases within the cylinder by exhaust gases outside the cylinder in their backward movement toward the cylinder to cause a rotational movement of the gases within

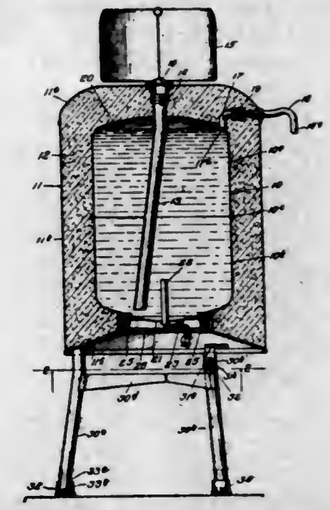
the cylinder, and the ports being arranged to be opened successively by the piston, beginning with

the port farthest along the chamber from the exhaust pipe.

2,408,400
FLINT ALLOY
Henry Kent, New York, N. Y.
No Drawing. Original application July 24, 1942, Serial No. 452,204. Divided and this application July 19, 1945, Serial No. 606,025
2 Claims. (Cl. 75—152)

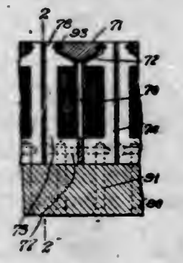
1. An alloy for flints consisting of approximately 300 parts in weight of misch-metal, 75 to 100 parts of iron, about 5 parts of copper, some magnesium and small quantities of silver, nickel and chromium, said magnesium being present in quantities up to approximately 2% and said quantities of silver, nickel and chromium together being less than 2% in weight of the alloy.

2,408,401
VEHICLE TRAILER
Edward F. King, Oak Park, Ill., assignor of one-half to Richard C. Helders, Chicago, Ill.
Application April 7, 1941, Serial No. 387,196
11 Claims. (Cl. 280—1)



1. In a trailer of the character described adapted for moving heavy machinery and the like, a trailer body adapted to be connected to a motor vehicle at its forward end, means including a removable wheel assembly for normally supporting the rear end of said trailer body in a raised position above the ground, and means including a power drive means carried by said wheel assembly and removable therewith for lowering said rear end of the body into supporting engagement with respect to the ground and lifting said end from said lowered position to said raised position.

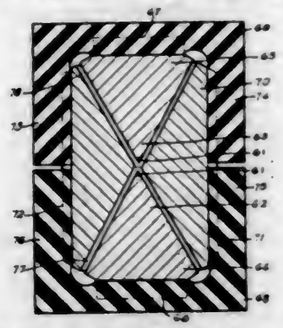
2,408,402
TRICHLOROETHYLENE COPOLYMERS
Harold Wilfred Arnold, Marshallton, Del., assignor to E. I. du Pont de Nemours & Company, Wilmington, Del., a corporation of Delaware
No Drawing. Application January 3, 1941, Serial No. 373,036
1 Claim. (Cl. 260—84)



A copolymer of trichloroethylene and methyl methacrylate containing approximately 13.8% trichloroethylene and approximately 86.2% methyl methacrylate.

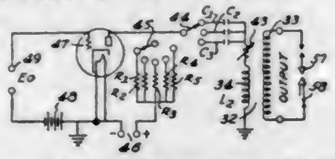
2,408,403
WATER HEATER
Henry B. Babson, Chicago, and Chester A. Thomas, Crystal Lake, Ill., assignors, by mesne assignments, to Losee Products Co., a corporation of Illinois
Application March 1, 1944, Serial No. 524,538
15 Claims. (Cl. 219—38)

1. A water heater of the character described, including: an inner tank having an opening of substantial area in the bottom thereof; a heat-insulating enclosure for said tank, the enclosure having a well registering with said opening; and an inwardly and upwardly extending bottom forming a depression; a hinge member secured to said bottom in said depression; a closure member adapted to be received in said well and to make sealing engagement with said tank to close said opening; an electrical heating element mounted in said closure member; thermostat control means mounted in said closure member, whereby all electrical elements are readily removable as a unit with the closure member; and a base portion for tiltably supporting the device and having a pivotal connection with said hinge member.



2,408,404
COMPRESSIONAL WAVE TRANSMITTING AND RECEIVING APPARATUS
Laurence Batchelder, Cambridge, Mass., assignor, by mesne assignments, to Submarine Signal Company, Boston, Mass., a corporation of Delaware
Original application May 19, 1933, Serial No. 671,870. Divided and this application March 13, 1934, Serial No. 715,349. Renewed September 19, 1938.
15 Claims. (Cl. 177—386)

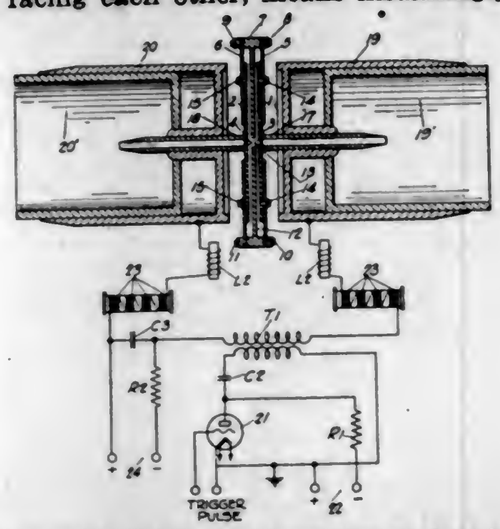
1. Means for producing a beam of compressional waves comprising a plurality of parallel



elongated plates having magnetostrictive strips attached to the same, means including said magnetostrictive strips for vibrating said plates at the desired frequency, means clamping said strips at the ends opposite the plates, said strips being tuned to resonance for the desired frequency of vibrations transverse to the long dimension of the strip.

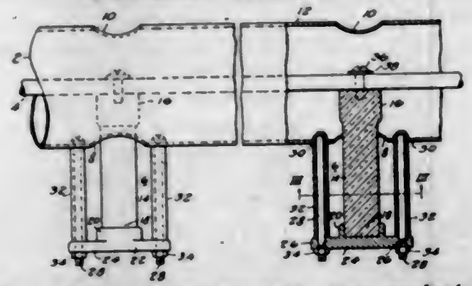
2,408,405
ELECTRICAL APPARATUS
Hugo Benioff, La Canada, Calif., assignor, by mesne assignments, to Submarine Signal Company, Boston, Mass., a corporation of Delaware
Application October 23, 1940, Serial No. 362,434
9 Claims. (Cl. 250—37)

1. A short wave spark tank circuit oscillator comprising a pair of metallic cones having aligned axes and arranged with the points facing each other, conductive means having a surface surrounding the conical surface of said cones opposed and spaced near thereto and insulating means supporting said cones and said means.



2,408,406
ELECTRICAL APPARATUS
Hugo Benioff, La Canada, Calif., assignor, by mesne assignments, to Submarine Signal Company, Boston, Mass., a corporation of Delaware
Original application April 30, 1941, Serial No. 391,153. Divided and this application October 8, 1941, Serial No. 414,133
3 Claims. (Cl. 250—37)

1. An ultra-high frequency electromagnetic spark oscillating system, comprising, in combination, an electromagnetic spark oscillator, a charging circuit comprising a power source, an air core transformer having its secondary connected to said spark oscillator, a condenser and a resistor all in series with each other, a grid controlled gaseous discharge tube having its anode connected through said resistance to said power source on one side thereof and its cathode to said power source on the other side thereof and means for supplying a potential to said grid at predetermined times to operate said circuit.

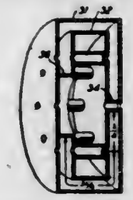


2,408,407
HIGH-FREQUENCY APPARATUS
Hugo Benioff, La Canada, Calif., assignor, by mesne assignments, to Submarine Signal Company, Boston, Mass., a corporation of Delaware
Application July 10, 1942, Serial No. 450,451
11 Claims. (Cl. 315—39)

1. In an ultra short wave oscillatory spark circuit, in combination, two flat plates spaced with their face surfaces in closely opposed relationship with each other, electrodes centrally positioned in opposing relationship on said plates and facing each other, means insulatingly sup-

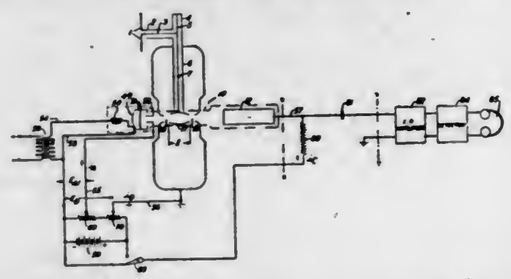
porting said plates in said position and an insulating sheet positioned midway between the faces of said two plates, said insulating sheet having a perforation in alignment with said electrodes.

2,408,408
HIGH VOLTAGE, HIGH POWER CONCENTRIC TRANSMISSION LINE
Ashley P. Bock, Catonville, Md., assignor to Westinghouse Electric Corporation, East Pittsburgh, Pa., a corporation of Pennsylvania
Application March 9, 1944, Serial No. 525,688
5 Claims. (Cl. 174—28)



1. An alternating-current transmission line comprising an outer hollow tubular conductor having a hole in its tubular wall, an inner tubular conductor spanning said hole, means for supporting said inner conductor inside and insulated from said outer conductor, said means comprising an insulator device passing through and clearing said hole, means for securing an outer end of said insulator device to said outer conductor, said insulator device having an inner end at said inner conductor, and clamping means on said inner insulator end, for securing and positioning the portion of said inner conductor associated therewith, said clamping means comprising a clamping member releasably clamping the conductor to said insulator device.

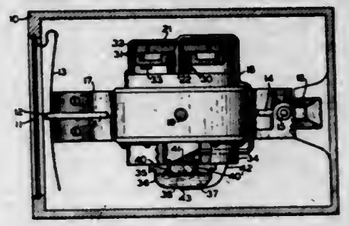
2,408,409
ULTRA HIGH FREQUENCY ELECTRONIC DEVICE
Arnold E. Bowen, Red Bank, N. J., assignor to Bell Telephone Laboratories, Incorporated, New York, N. Y., a corporation of New York
Application April 8, 1941, Serial No. 387,432
14 Claims. (Cl. 315—5)



1. A resonator comprising a hollow cylindrical shell of conductive material substantially closed

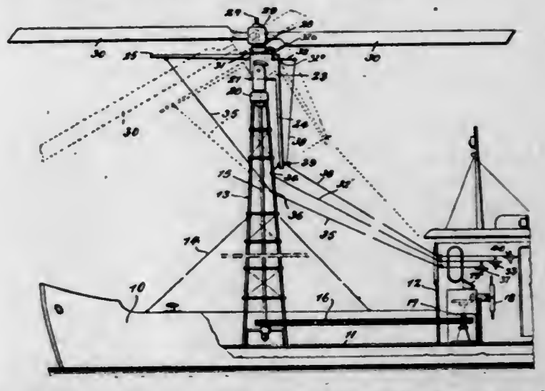
by plane conductive end plates, and a coaxial cylindrical conductive core of slightly shorter length and slightly smaller diameter than said shell, said core being positioned within said shell

and spaced therefrom by means comprising coaxial cylindrical conductive spacers at either end of said core, said spacers being of materially different radius at the two ends of the core.



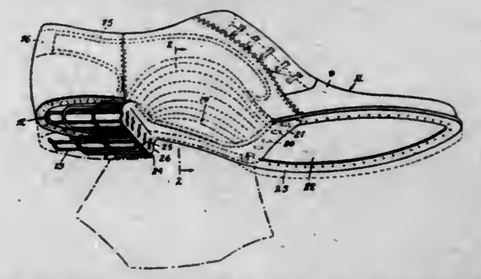
2,408,410
FREQUENCY CONVERTER
John W. Clark, Chatham, N. J., assignor to Bell Telephone Laboratories, Incorporated, New York, N. Y., a corporation of New York
Application June 19, 1941, Serial No. 398,757
7 Claims. (Cl. 315—5)

1. In a frequency converter, an oscillator comprising a resonating chamber for ultra-high frequency waves, a drift tube enclosed within said chamber, and said chamber walls and said drift tube having aligned apertures, means for directing a stream of electrons through said apertures whereby said electron stream is velocity varied by electromagnetic waves within said chamber, and means for adjusting the transit time of the electrons traversing said drift tube to initiate and sustain said oscillations; means for impressing between said drift tube and said chamber walls a wave having a frequency comparable to but different from the frequency of said oscillations whereby a second velocity variation is superposed upon said electron stream, and means non-linearly responsive to velocity variations of said electron stream, operative upon a doubly velocity-varied portion of the stream.



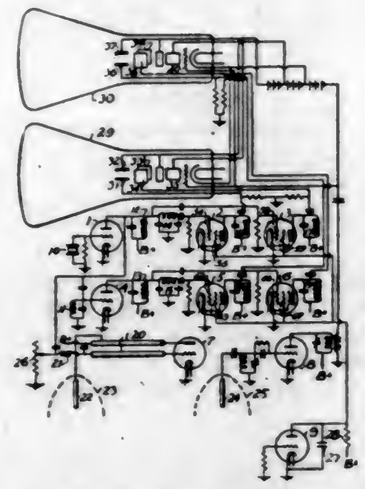
2,408,411
ERECTING MEANS FOR GYRO VERTICAL INSTRUMENTS
Robert S. Curry, Jr., Baldwin, N. Y., assignor to Sperry Gyroscope Company, Inc., a corporation of New York
Continuation of application Serial No. 448,980, June 29, 1942. This application August 16, 1944, Serial No. 549,712
17 Claims. (Cl. 74—5)

1. Erecting means for gyro vertical instruments having a gyro rotor bearing case comprising a motor mounted on the case, having a polyphase wound type stator and a gravitationally unbalanced, single phase wound type rotor, a source of electrical energy for said motor, and a vertical reference maintaining switching means responsive to tilt of the case for effecting selective energization of the windings of said poly-phase wound type stator to move said gravitationally unbalanced rotor to a position in which



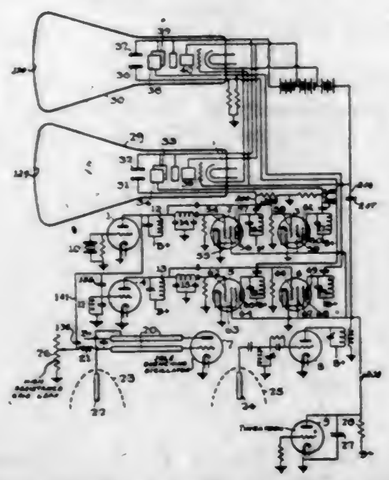
the same is effective to exert a tilt correcting torque on the instrument.

2,408,412
PROPULSION AND STABILIZATION OF WATERCRAFT AND THE LIKE
Horace M. Dobbins, Pasadena, Calif.
Application February 16, 1944, Serial No. 522,628
1 Claim. (Cl. 114—39)



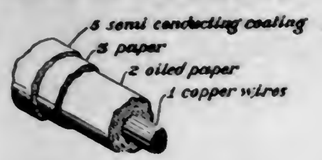
A craft of the character described comprising a hull, an upright mast carried by the hull, a rotatable shaft supported by the mast, a forked yoke mounted on the shaft, the arms thereof being extended upwardly, a hub support pivoted between the arms of the yoke and having a stud shaft thereon having a neutral vertical position at a medial position of the pivotal movement of the hub support, an aerofoil having a hub revoluble on the stud shaft, means to rotate the rotatable shaft and associated yoke at will, consisting of a remote manual control, said hub support comprising arms disposed at an angle of 90 degrees to each other, remotely operable means associated with respective arms to tilt said hub support from said medial position to variable angles at will, and a brake means on the stud shaft remotely operable at will.

2,408,413
SUPPORTING FRAME FOR ARTICLES OF FOOTWEAR
William H. Doherty, Elmhurst, N. Y.
Application January 17, 1945, Serial No. 573,176
5 Claims. (Cl. 36—8.5)



1. A supporting frame for an article of footwear, said frame comprising a unitary wire member wound in labyrinthine fashion to form interconnected heel, shank, arch and counter parts.

2,408,414
ABSOLUTE ALTIMETER
Charles A. Donaldson, Del Rio, Tex.
Application June 19, 1939, Serial No. 279,949
5 Claims. (Cl. 315—24)



1. In an indicator for use in an absolute altimeter or for indicating phase differences between any cyclically recurrent voltages, a timing oscillator having either the same frequency or some subharmonic of the frequency of the voltage to be examined for the phase difference between it and the timing frequency, a 90 degree phase shift circuit, a device to vary cyclically the resultant quarter-phase voltage from zero to maximum, a cathode-ray tube with a high negative bias on the grid, with the deflection plates connected to said quarter-phase circuit so that the electron beam traces a series of spirals, a sharp pulse generating device controlled by the voltage to be examined and connected so as to apply a sharp positive pulse to the grid of the cathode-ray tube overcoming the negative bias and causing a bright spot to appear at a certain point for each $360 \times N$ degrees of rotation of the electron beam, where N is a whole number, and, as the diameter of the electron beam spiral varies cyclically from zero to maximum, traces a radial line from the center to the periphery of the screen.

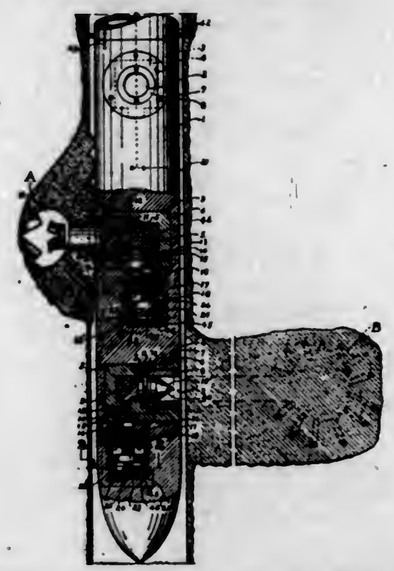
2,408,415
DISTANCE GAUGING AND LIKE APPARATUS
Charles A. Donaldson, Del Rio, Tex.
Application February 11, 1942, Serial No. 430,464
14 Claims. (Cl. 250—1.66)

6. In radio apparatus, a receiving antenna for receiving periodic pulses of oscillations of high frequency, a principal oscillator and an auxiliary oscillator, said oscillators having frequencies which differ by a frequency which is the frequency of said periodic pulses, a cathode-ray tube having a first set of electrodes connected to said principal oscillator, a detector connected to said receiving antenna, a mixer tube having a first control electrode connected to the output of said detector and further having a second control electrode connected to said auxiliary oscillator, and electronic means adapted to produce a sharp voltage pulse connected between the output of said mixer tube and a second electrode of said cathode-ray tube.

2,408,416
SEMICONDUCTING COMPOSITION
Donald E. Edgar, Westport, and David J. Sullivan, Fairfield, Conn., assignors to E. I. du Pont de Nemours & Company, Wilmington, Del., a corporation of Delaware
Application February 18, 1944, Serial No. 522,979
15 Claims. (Cl. 174—102)

1. A semi-conducting coating composition particularly adapted for the manufacture of high tension electric cables comprising a resinous vehicle containing a non-drying oil modified alkyd resin, a polyvinyl acetal resin, a urea-formaldehyde resin and a carbon black having electrical resistivity of less than about 1.0 ohm per 1" cube in the proportion of between about 0.25 and 4 parts by weight of said resinous vehicle to 1 part of said carbon black.

9. An electric cable comprising an insulated conductor having an outer layer of a composition containing the composition of claim 1.

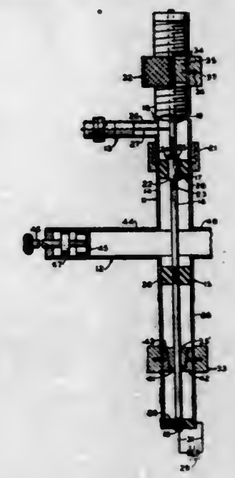


2,408,417
TANNING AGENTS AND METHODS OF TREATING HIDES AND SKINS THEREWITH
William C. Ellenbogen, York, Pa.
No Drawing. Application April 15, 1944, Serial No. 531,294
7 Claims. (Cl. 8—94.26)

5. The process of tanning hides or skins which comprises treating them with an aqueous solution containing an iron salt, a substance selected from the group consisting of the salts of hydroxy mono and polycarboxylic acids and polycarboxylic acids having at least one double linkage, and a substance selected from the group consisting of the salts of amidines of higher fatty acids and derivatives of such amidines in which at least one of the hydrogen atoms attached to nitrogen is replaced by an aliphatic radical.

2,408,418
FRUIT TREATMENT
Arvid M. Erickson, San Jose, and John D. Ryan, Campbell, Calif., assignors to Barron-Gray Packing Company, San Jose, Calif., a corporation of California
No Drawing. Application September 11, 1942, Serial No. 457,976
13 Claims. (Cl. 127—46)

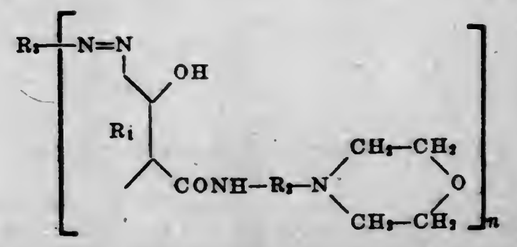
1. In the process of preparing a sweetening medium from fruit, the steps which comprise adding an acidic material to a composition obtained by grinding fruit material and comprising the sweetening ingredients of the fruit together with acids and ash-forming materials of the fruit, said acidic material being added in an amount sufficient to materially reduce the pH of the fruit composition and to produce an improved color in the clear liquid obtained as hereinafter set forth, then adding an alkaline defecating agent in an amount sufficient to increase the pH of the fruit composition to substantially the pH above 10 at which a break occurs and which results in the formation subsequently of a granular, readily filterable and washable precipitate, then when the reaction at this pH is complete, adding an acid defecating agent in an amount sufficient to reduce the pH to a pH below about pH 9.2 at which said granular, readily filterable and washable precipitate is formed, and thereafter separating the precipitate so formed to leave a clear liquid, said composition being maintained at a temperature below about 54° C. at least during the time when it has a pH above about 9.2.



2,408,419
WELL EXPLOSIVE DEVICE
James Lewis Foster, Wichita Falls, Tex.
Original application March 17, 1939, Serial No. 262,531. Divided and this application December 2, 1942, Serial No. 467,657
9 Claims. (Cl. 89—1)

1. In a well having a bore hole projecting into a surrounding fluid-bearing earth formation, the combination of a well casing projecting said bore to a point spaced above the lower end of the bore, an explosive device suspended within the bore, an explosive projectile carried by said device, and means on the explosive device for discharging the explosive projectile into said surrounding fluid-bearing earth formation at a point below the casing to increase the exposed area of the fluid-bearing formation.

2,408,420
FREQUENCY MULTIPLIER
Edward L. Ginzton, Garden City, N. Y., assignor to Sperry Gyroscope Company, Inc., a corporation of New York
Application January 13, 1944, Serial No. 518,054
21 Claims. (Cl. 172—281)



14. A microwave frequency multiplier comprising a hollow pipe wave guide, first and second tubular conductors connected to said wave guide and extending in opposite directions therefrom, a further conductor extending through said first tubular conductor, said wave guide and said second tubular conductor and forming with said first and second tubular conductors, first and second coaxial transmission lines coupled to said wave guide, a first crystal rectifier positioned within said first tubular conductor and connected in series with said further conductor, a second crystal rectifier positioned within said second tubular conductor and connected in series with

said further conductor, means for applying to said further conductor intermediate said first and second crystal rectifiers ultra high frequency energy of a wavelength longer than the cut-off wavelength of said wave guide, movable means in said first tubular conductor for providing an ultra high frequency current path between said first tubular conductor and said further conductor, and movable means in said second tubular conductor for providing an ultra high frequency current path between said second tubular conductor and said further conductor.

2,408,421
WATER INSOLUBLE AZO DYESTUFFS CONTAINING AN N-MORPHOLINO-ARYLIDE GROUP
Harry Wilhelm Grimmel, Easton, and Alfred Guenther, Riegelsville, Pa., assignors to General Aniline & Film Corporation, New York, N. Y., a corporation of Delaware
No Drawing. Application October 19, 1944, Serial No. 559,478
6 Claims. (Cl. 260—152)

1. Water-insoluble azo dyestuffs of the general formula:

wherein R_1 represents a radical of the group consisting of the naphthalene, anthracene, carbazole, benzo-carbazole, diphenylene oxide, diphenylene sulfide, fluorene and fluorenone radicals; R_2 represents a radical of the benzene series linked directly through a carbon atom of the benzene ring with the nitrogen atom of both the

amido and morpholine groups; R_3 represents an aromatic radical, the radicals R_2 and R_3 being free from water-solubilizing groups, and n is one of the numbers 1 and 2.

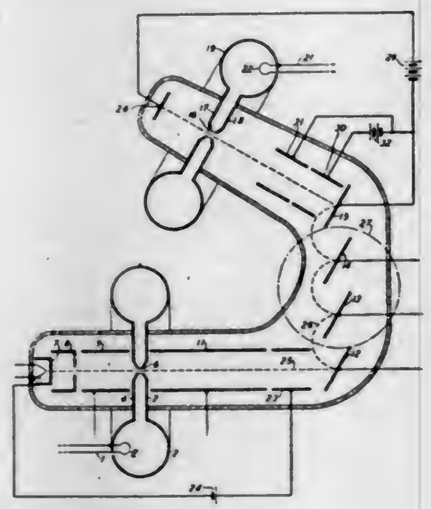
2,408,422

METHOD OF PREPARING AND APPLYING A PATCH FOR A FOURDRINIER WIRE

Jesse A. Harris, West Linn, Oreg., assignor to Crown Zellerbach Corporation, San Francisco, Calif., a corporation of Nevada

Application October 29, 1943, Serial No. 508,222
1 Claim. (Cl. 140—3)

The method of patching the Fourdrinier wire in a paper-making machine comprising cutting a piece of woven wire fabric of finer mesh than the Fourdrinier wire to proper size to extend over the portion of the Fourdrinier wire to be patched, removing several "shute" wires from opposite ends of said piece so as to leave the warp strand ends projecting from the ends of said piece, bending down the alternate projecting warp strand ends, cutting off said bent-down warp ends and turning their stubs back against the under side of the adjacent "shute" wire to prevent said stubs from extending from the top surface of the patch, straightening out the kinks in said remaining projecting warp ends to facilitate their insertion in the meshes of the Fourdrinier wire, bending down the warp strand ends extending from the rear end of said piece until they are approximately at right angles to said piece, inserting the warp strand ends at the forward end of said piece through meshes of the Fourdrinier wire slightly ahead of the place to be patched by holding said patching piece against the Fourdrinier wire while positioned perpendicularly and transversely thereon, securing the forward end of said patching piece in place on the Fourdrinier wire by bending said forward warp strand ends back against the under side of the Fourdrinier wire in the direction opposite to the direction of Fourdrinier wire travel, tilting said patching piece back down on the Fourdrinier wire and inserting the bent-down warp ends at the rear of said piece through the Fourdrinier wire until the patching piece lies flat against the top face of the Fourdrinier wire, and securing the rear end of said patching piece in place by bending said rear warp ends back on the under side of the Fourdrinier wire in the direction opposite to the direction of Fourdrinier wire travel.



2,408,423

HIGH FREQUENCY AMPLIFYING APPARATUS

Ralph V. L. Hartley, Summit, N. J., assignor to Bell Telephone Laboratories, Incorporated, New York, N. Y., a corporation of New York

Application February 5, 1941, Serial No. 377,430
7 Claims. (Cl. 250—175)

1. An electron discharge device comprising means for producing an electron beam, means positioned along the path of the beam for velocity varying the electrons of the beam, a secondary emission surface intercepting the path of the beam and adapted to emit secondary electrons in response to incident primary electrons, means also positioned along the path of the beam for setting up an opposing field in the path of the beam to slow down the electrons of the velocity varied beam and to direct the retarded beam against the secondary emission surface, whereby

a beam of secondary electrons is produced having density variations corresponding to those of the incident primary beam, and output means within the discharge device and positioned along the path of the secondary beam and electrically coupled thereto to abstract from the secondary beam energy corresponding to the density variations therein.

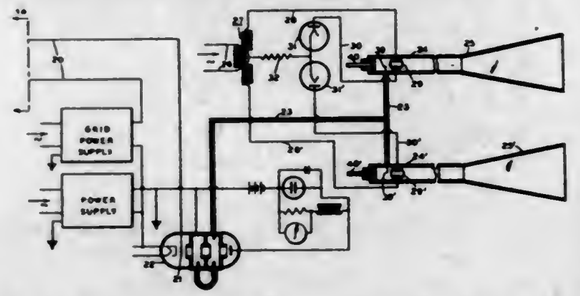
2,408,424

PICKLING STEELS

John J. Healy, Jr., Brookline, Maurice H. Taylor, Stoneham, and Furio A. Abbiati, Longmeadow, Mass., assignors to Monsanto Chemical Company, St. Louis, Mo., a corporation of Delaware

No Drawing. Application June 15, 1940, Serial No. 340,772
10 Claims. (Cl. 252—142)

6. The method of pickling stainless steels which comprises immersing them in an aqueous acid reacting non-electrolytic pickling bath comprising essentially water, mineral acid and active pickling agents consisting of ferric sulfate and an alkali fluoride, said sulfate being present in the bath in an amount varying between 1 and 30% and said fluoride being present in an amount varying between 0.6 and 25%, said bath being substantially free of nitric acid.



2,408,425

INSTRUMENT LANDING SYSTEM

Frederic A. Jenks, Mineola, Donald F. Folland, Hempstead, Abbott S. Maeder, Scarsdale, and William T. Cooke, Huntington, N. Y., assignors to Sperry Gyroscope Company, Inc., Brooklyn, N. Y., a corporation of New York

Application April 4, 1941, Serial No. 386,766
14 Claims. (Cl. 250—11)

3. In an instrument landing system of the character described, an ultra high frequency generator, a pair of audio oscillators of different frequency outputs, said oscillators having feedback means including grid controlled rectifiers, a source of A. C. supply connected for alternately energizing said grid controlled rectifiers whereby first one and then the other of said oscillators is rendered operative, means for modulating the output of said generator with the outputs of said oscillators, whereby the output of said generator is alternately modulated at different frequencies, a pair of electromagnetic radiation means, means connecting the ouput of said generator to said pair of radiation means including wave guide means and gas discharge tube means contained in said wave guide means and controlled from said source of A. C. supply for alternately supplying each of said radiation means with the output of said generator in synchronism with the alternate energization of said rectifiers.

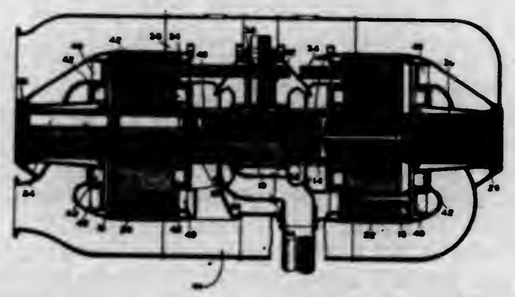
14. A method of directing radio frequency energy from a source through one of a plurality of radio frequency energy wave-guides branching from said source to respective output circuits, said method comprising forming a reflecting curtain of ionized gas intermittently within one and then the other of said wave guides to direct said energy successively through said respective wave guides.

2,408,426

PREPARATION OF MODIFIED METHYL METHACRYLATE COMPOSITIONS

Frederick L. Johnston, Claymont, Del., assignor to E. I. du Pont de Nemours & Company, Wilmington, Del., a corporation of Delaware

No Drawing. Application January 12, 1943, Serial No. 472,161
2 Claims. (Cl. 260—83)



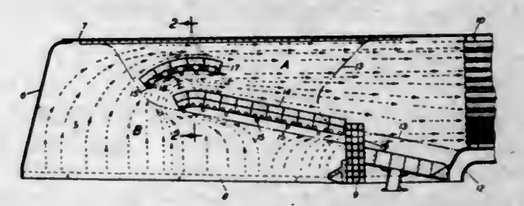
1. Process of preparing a modified methyl methacrylate composition which comprises polymerizing a dispersion of monomeric methyl methacrylate in water in the presence of 0.01% to 3.0% by weight of the monomer of trichloroethylene at a temperature of 100° C.–150° C. under autogenous pressure.

2,408,427

CYLINDER CONSTRUCTION

Andrew Kalitinsky, Eagleville, Conn., assignor to United Aircraft Corporation, East Hartford, Conn., a corporation of Delaware

Application May 11, 1943, Serial No. 486,615
13 Claims. (Cl. 309—2)



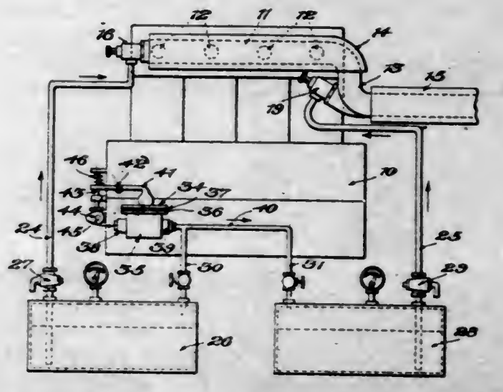
8. In a free-piston engine-and-compressor unit, a cylinder having right and left hand threads at the ends, and opposed heads for said cylinder having cooperating threads engaging the threads at the ends of the cylinder.

2,408,428

MEANS FOR RETARDING CINDER CUTTING

Walter B. Leaf, Denver, Colo.

Application March 2, 1943, Serial No. 477,778
5 Claims. (Cl. 110—87)



4. In a fire box having a lower grate section, a flue sheet at its rear end, a crown sheet forming an upper closure for the fire box, a main arch inclined upwardly and forwardly from a rear point of support adjacent the flue sheet and extending in undulating arrangement laterally of the fire box to bridge the same and divide its space into upper and lower combustion zones, and a deflector arch supported in overhanging relation to said main arch with a portion extending forwardly beyond the end of the main arch to divide the gases of combustion rising from said grate section prior to their passage between the main arch and the crown sheet, the surface of the deflector arch nearest the main arch being arranged in substantially parallel relation to said undulating contour of the main arch to cause the gases traveling between said surfaces to travel at substantially uniform velocity throughout the width of the fire box.

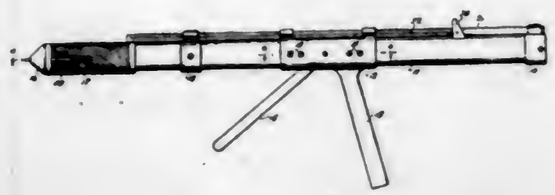
2,408,429

SMOKE SCREEN COMPOSITION AND THE METHOD OF DEVELOPING SMOKE SCREENS THEREFROM

Harold A. Levey, New Orleans, La., assignor to Alonzo C. Patterson, New Orleans, La.

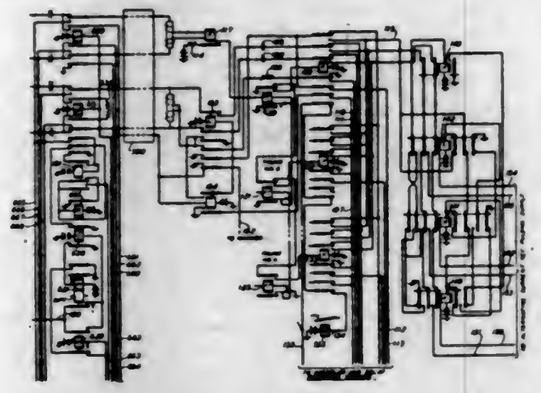
Application May 6, 1942, Serial No. 441,989
10 Claims. (Cl. 252—305)

1. The method of developing a colored smoke screen comprising suspending solid inert pigment particles which maintain their predetermined pigment properties at temperatures varying between 500° and 800° F. in a volatile liquid capable of ready gasification on the application of heat with substantially no residue, said pigment particles being substantially insoluble in said volatile liquid, heating said mixture to gasify said liquid and form dry particles of pigment, and simultaneously subjecting the dry particles of pigment to the action of a moving gas containing



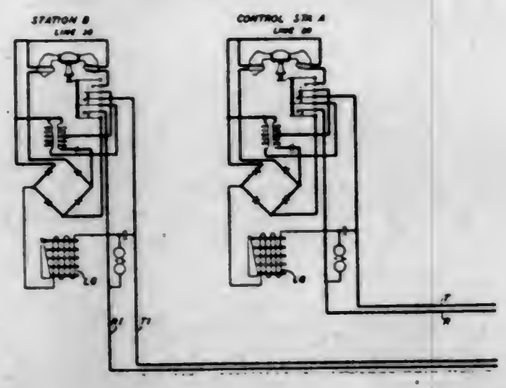
gasified particles of a smoke screen base inhibiting the wetting of the dry pigment particles, said gasified particles condensing on contact with the atmosphere, said moving gas and its gasified particles of the smoke screen base having a different color from that of the predetermined color of the pigment particles, said pigment particles upon incorporation in said gas forming a smoke screen in which the pigment particles maintain their predetermined color value and impart said color value to the smoke screen.

2,408,430
FRICTION COMPOSITION PRODUCT
Francis J. Lowey, Bay Village, and Charles H. Tower, Cleveland, Ohio, assignors to The S. K. Wellman Company, Cleveland, Ohio, a corporation of Ohio
Application April 4, 1944, Serial No. 529,490
6 Claims. (Cl. 75—22)



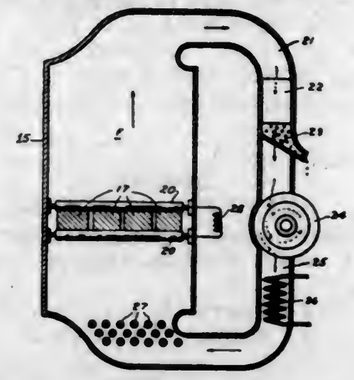
4. Friction brake and clutch facing material comprising sintered powdered material comprising a composition of copper as the major ingredient and tin, iron, silica, graphite, and molybdenum sulphide as the minor ingredients, said molybdenum sulphide being between 3 and 12% of the composition, said friction material being characterized by high coefficient of friction and low fade of the coefficient of friction with increasing slipping speed.

2,408,431
BLIND RIVETING APPARATUS
Oakley D. Lutes, Jackson, Mich., assignor to Seiden Pneumatic Tool Company, a partnership composed of Oakley D. Lutes and Emory Lutes
Application February 26, 1943, Serial No. 477,185
18 Claims. (Cl. 218—19)



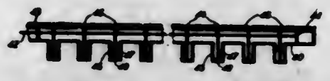
1. A blind riveting mechanism comprising a frame supporting therein a rivet magazine, a bifurcated anvil supported at one end of said frame and biased toward open position, a mandrel for expanding rivets, a wire, an actuating block therefor, said mandrel being supported by one end of said wire and said wire extending through said magazine and terminating in said actuating block, a rivet escape and brake mechanism including a detent, a rivet forwarding means including reciprocating pinchers for separating the foremost rivet from a series of rivets mounted on said wire, a reciprocable actuating mechanism operating to close said bifurcated anvil, to release said escape mechanism detent, and to actuate said pinchers, and means for engaging said actuating block to draw said mandrel toward and through said bifurcated anvil.

2,408,432
TELEPHONE SYSTEM
Martin E. Maloney, Flushing, N. Y., assignor to Bell Telephone Laboratories, Incorporated, New York, N. Y., a corporation of New York
Application May 23, 1945, Serial No. 595,301
11 Claims. (Cl. 179—27)



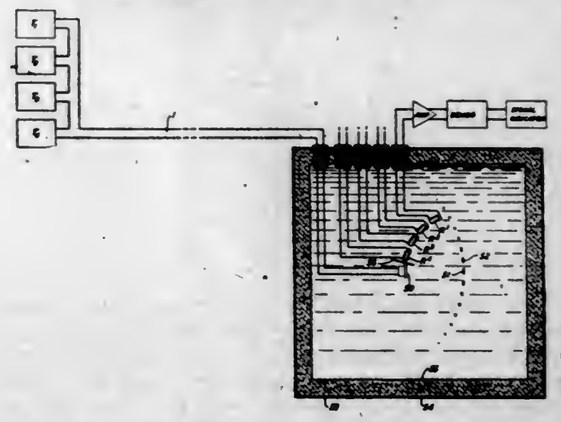
7. In a telephone system, a toll office, trunks incoming to said office, trunks outgoing from said office, said outgoing trunks arranged in groups, an overflow trunk individual to each group, means effective when all of a group of outgoing trunks are busy to connect a plurality of incoming trunks to the overflow trunks individual to said group of outgoing trunks, means to transmit an overflow signal over said overflow trunk to said plurality of incoming trunks, means responsive to one of said group of outgoing trunks becoming idle to transmit a reorder signal over said overflow trunk to said plurality of incoming trunks, means responsive to a recall over one of said incoming trunks to transmit an identification of said group of outgoing trunks to said one incoming trunk and means simultaneously effective to again transmit an overflow signal to the others of said plurality of incoming trunks.

2,408,433
TELEPHONE SYSTEM
William A. Malthaner, New York, N. Y., assignor to Bell Telephone Laboratories, Incorporated, New York, N. Y., a corporation of New York
Application February 13, 1943, Serial No. 475,745
12 Claims. (Cl. 179—18)



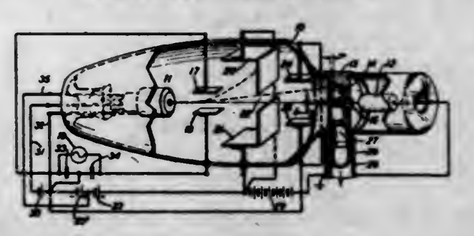
1. In a telephone system, a calling line, line extending means, line settable means, and a circuit for verifying the number of said line comprising one branch established by said line extending means and another branch established by said line settable means when set from said calling line in accordance with the number thereof.

2,408,434
METHOD AND APPARATUS FOR DRYING MATERIALS UNIFORMLY THROUGHOUT THEIR MASS
Julius W. Mann and George F. Russell, Tacoma, Wash.
Application March 2, 1942, Serial No. 432,936
10 Claims. (Cl. 34—1)



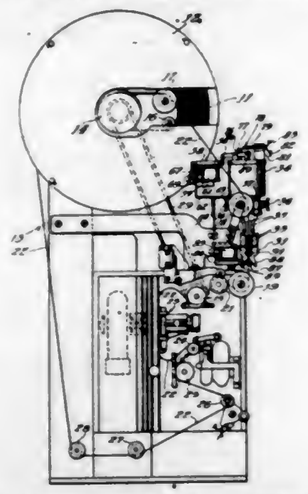
1. The herein described continuous process of drying material which comprises continuously moving the material through a zone containing radio waves that will pass through the material for raising the temperature within the material, controlling the temperature and relative humidity of the air surrounding the material as it passes through the zone for raising the surface temperature of the material in uniformity with the rise in temperature within the material to obviate the forming of moisture gradient in the material which will result in its cracking, the relative humidity of the air being lowered as the temperature of the material is raised for causing the vapor pressure within the material to exceed the vapor pressure in the air, whereby there is a rapid flow of water vapor from the material with a uniform dehydrating of the material resulting.

2,408,435
PIPE ANTENNA AND PRISM
Warren P. Mason, West Orange, N. J., assignor to Bell Telephone Laboratories, Incorporated, New York, N. Y., a corporation of New York
Application March 1, 1941, Serial No. 381,236
12 Claims. (Cl. 250—11)



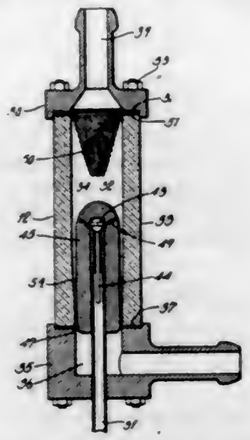
9. In a radio system for directively radiating and receiving a band or spectrum of frequencies, each frequency of said spectrum being radiated or received with greatest amplitude with respect to a particular direction, the direction of maximum amplitude being different for each frequency of said spectrum, a radiating and receiving device comprising a substantially uniform radio transmission line, the length of said line being great with respect to the longest wavelength of said system, said transmission line being enclosed within an outermost member of conductive material, said outermost member comprising solely a tubular member of uniform cross-sectional area throughout its length, said member having therein a plurality of holes regularly spaced in a straight line extending substantially the entire length of said member, all dimensions of said holes being small with respect to one-quarter of the shortest wave-length of said system, the intervals between holes being between one-quarter and one-half of said shortest wave-length whereby each frequency of said spectrum will be radiated or received by said device with greatest amplitude with respect to a particular direction, the direction being different for each frequency within said spectrum.

2,408,436
MULTIPLEX COMPRESSIONAL WAVE SYSTEM
Warren P. Mason, West Orange, N. J., assignor to Bell Telephone Laboratories, Incorporated, New York, N. Y., a corporation of New York
Application October 24, 1942, Serial No. 463,279
11 Claims. (Cl. 178—44)



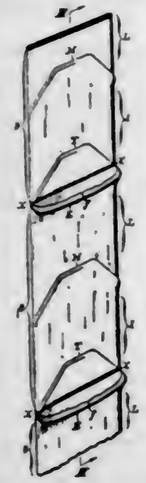
2. A diffraction grating for separating different frequency waves comprising parallel alternate transmission and non-transmission elements of substantially equal lengths, the central axes of the transmission elements being uniformly spaced and the transmission elements decreasing in area from the central element to the outer element in sinusoidal fashion with relation to distance from the center of the grating whereby the non-transmission elements increase sinusoidally from the center to the outermost element but in a converse manner.

2,408,437
HARMONIC GENERATING SYSTEM
James W. McRae, Neptune, N. J., assignor to Bell Telephone Laboratories, Incorporated, New York, N. Y., a corporation of New York
Application October 11, 1941, Serial No. 414,695
8 Claims. (Cl. 315—5)



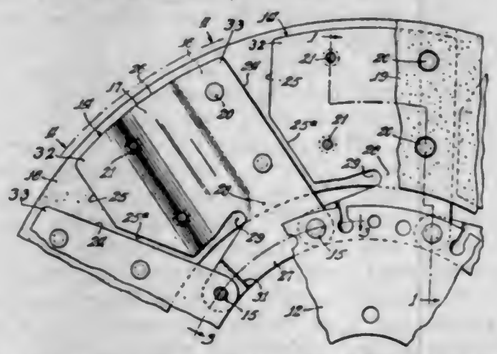
1. A harmonic generating system comprising a source of waves of given frequency, means to provide a beam of moving charged particles, a resonating chamber resonant to a harmonic of said given frequency and having an aperture in its wall permitting access of said beam into the interior of the chamber, means energized by said source of waves of given frequency to direct said beam into said aperture to react with an electromagnetic wave within said resonating chamber, and means to control said beam directing means to limit the phase of said reaction substantially to transfer energy only from said beam to said wave.

2,408,438
FILM CLEANING DEVICE
Bert E. Mills, Oak Park, Ill., assignor to Mills Novelty Company, Chicago, Ill., a corporation of Illinois
Application June 18, 1942, Serial No. 447,605
10 Claims. (Cl. 15—100)



8. A film cleaning device comprising wiper elements engageable with the film in a course of travel thereof, means for supplying cleaning solution to said wiper elements, and electrically-operated control devices for moving the wiper elements into and out of engagement with the film and for causing the feeding of cleaning solution to said wiper elements only when they are in film-engaging position.

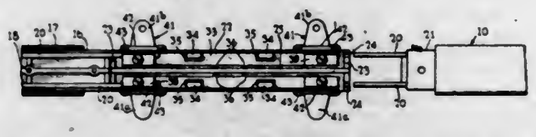
2,408,439
APPARATUS FOR CARBONATING LIQUIDS
Richard Muehlhofer, Mountainside, N. J.
Application June 9, 1943, Serial No. 490,380
8 Claims. (Cl. 261—50)



1. In a device of the class described, the combination of an upstanding open end tube of transparent material forming a sight tube having a bore of greater diameter at its upper than at its lower end, a base provided with a bore forming a liquid inlet and into which is fitted the lower end of the tube, a cap fitted to the top of the tube and provided with a bore forming an outlet therefrom, a gas supplying tube extending through the base and terminating in an upstanding part within the sight tube, a gas metering valve for controlling the gas discharged from the gas tube and provided with a tapered stem guided in the bore of the gas tube, a hood separate from the gas valve and capable of movement to its open position independently of the position of the gas valve at that instant of time forming a weighted float guided for vertical movement on said upstanding part of the gas tube, normally resting on the gas valve to seat it and thus close off the gas tube, the lower portion of the hood substantially closing the lower end of the sight tube when the hood is resting on the seated gas valve, and said hood provided adjacent its upper end with gas vents for distributing gas from the open gas tube into the liquid as it flows through the sight tube and past the hood when elevated by the flowing liquid and means for limiting the upward movement of the floating hood.

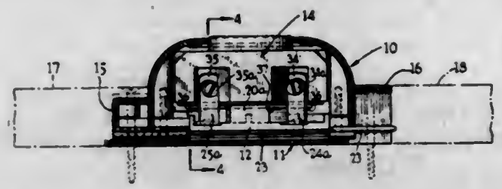
2,408,440
SEAMLESS STOCKING
George Norman, Griffin, Ga., assignor to Spalding Knitting Mills, Griffin, Ga., a corporation of Georgia
Application February 26, 1945, Serial No. 579,794
4 Claims. (Cl. 66—178)

1. As a new article of manufacture, a knitted product in the form of a string consisting of a series of seamless stocking blanks with closed toes and the top of one blank detachably connected half way round along the crosswise closure line of the toe of an adjacent blank by a removable course of loops formed from yarn used in the knitting of the string.



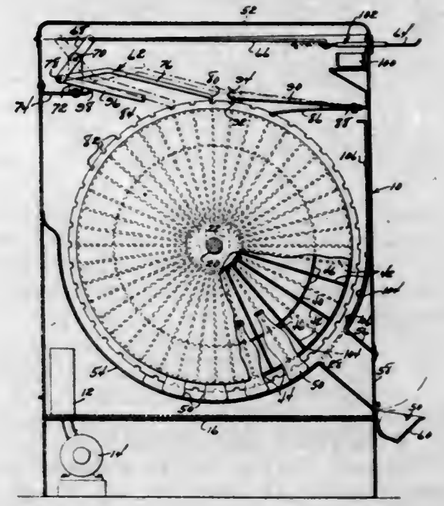
2,408,441
CLUTCH PLATE
Harold Nutt, Chicago, Ill., assignor to Borg-Warner Corporation, Chicago, Ill., a corporation of Illinois
Application October 2, 1944, Serial No. 556,710
5 Claims. (Cl. 192—107)

1. A friction clutch plate cushion element of substantially rectangular shape that comprises a wing portion having a flat radial region adjacent a side edge and a bowed region of greater



extent than the flat region, the side edges of said wing having parallel portions and one of said edges having an inwardly extending oblique portion; a narrow neck portion forming a continuation of the flat wing region; an elongated foot portion extending lateral to said neck portion for effecting anchorage of the cushion element on a support; and an offset region at an end of said foot portion.

2,408,442
ELECTRICITY CONDUCTOR UNIT
Joseph F. O'Brien, Jersey City, N. J., assignor to John B. Pierce Foundation, New York, N. Y., a corporation of New York
Original application July 25, 1941, Serial No. 403,978. Divided and this application August 21, 1943, Serial No. 500,051
2 Claims. (Cl. 173—334.1)

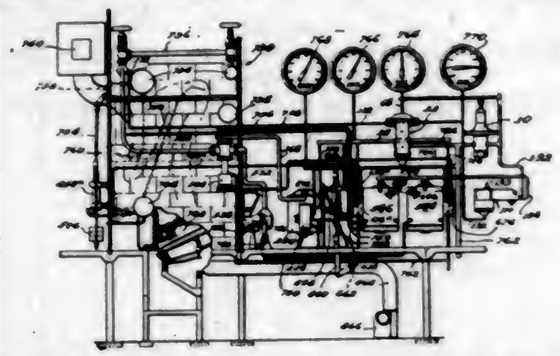


1. A unit of an electric wiring system of seriatim-interconnected units, comprising a base of electrical insulation material, a central rib integral with said base and extending longitudinally thereof, electricity conductors disposed on said base on each side of said rib, lugs on said conductors extending into said base in frictional engagement therewith to secure said conductors thereto, and a three-sided cover of electrical insulation material adapted to completely enclose said base and said conductors, said cover having eave-like portions extending beyond the ends of said base for the reception of the ends of an adjacent unit of such wiring system.

2,408,443
ADAPTER UNIT FOR ELECTRIC WIRING SYSTEMS
Joseph F. O'Brien, Jersey City, N. J., assignor to John B. Pierce Foundation, New York, N. Y., a corporation of New York
Application December 31, 1943, Serial No. 516,347
7 Claims. (Cl. 173—330)

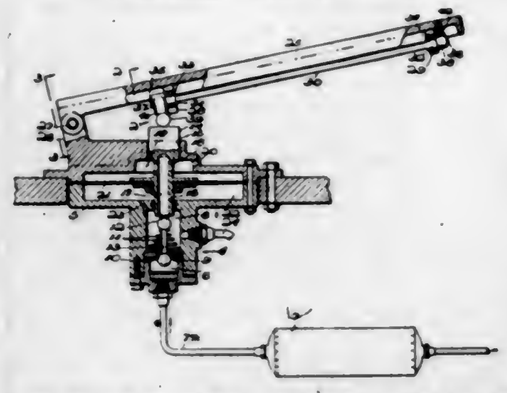
1. A unit of an electric wiring system embodying conductor units arranged for electrical and mechanical interconnection in seriatim, comprising a conductor block having electricity conductors disposed on one face thereof in mutually insulated, spaced relationship and having terminals extending from each end of said block, electrically conductive lugs disposed on the opposite face of said conductor block and mechanically and electrically interconnected with said conductors, an outlet fixture having connection terminals mechanically and electrically connected to said lugs; a cap member to removably receive said interconnected fixture and conductor block, and a closure member for said cap, said closure member supporting said conductor block in operative position, and having spaced longitudinally extending walls at each end to provide channels for individually receiving the extending terminals of said conductors, and having, intermediate its ends, spaced longitudinally extending walls to provide channels for individually receiving the said electricity conductors.

2,408,444
BOTTLE DISPENSING REFRIGERATOR
Frank U. Payne, Farner, Tenn.
Application July 10, 1943, Serial No. 494,230
5 Claims. (Cl. 312—97.1)



1. In a bottle dispensing refrigerator, the combination of a refrigerated chamber having an outlet, a bottle dispensing wheel mounted for rotation about a horizontal axis inside said chamber, said wheel being provided with a hub, and circular side walls on the hub, a circular dividing wall, and a peripheral wall about the aforementioned walls, and a wall concentrically arranged between the hub and the peripheral wall, said latter wall and the peripheral wall having openings therein, the openings of the latter wall being smaller than those of the peripheral wall, and staggered radial walls dividing the spaces between the aforementioned walls into compartments for loosely supporting bottles arranged endwise with respect to the axis of the wheel and equally spaced one from the other circumferentially of the wheel, said outlet being located at a low point with respect to said wheel, a bottle track about the lower circumferential extent of the wheel to hold the bottles in the wheel but terminating at said outlet to cause bottles to drop into the outlet as they are moved beyond the track, a notched flange on the wheel and means engaging the notches of the flange for rotating the wheel step by step to bring one bottle at a time to a position beyond said track.

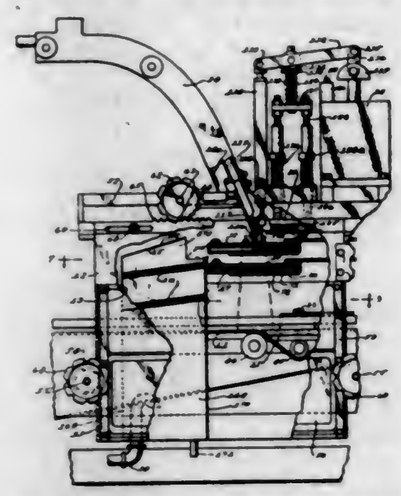
2,408,445
COMBUSTION CONTROL APPARATUS
Swan A. Pearson, Chicago, Ill.
Application April 28, 1942, Serial No. 440,791
6 Claims. (Cl. 110—54)



1. A device for controlling the rate at which fuel is fed to a boiler of the type having means for feeding fuel to a boiler comprising, a source of constant pressure, steam pressure responsive means adapted to increase the activity of said fuel feeding means upon a decrease in steam pressure, said steam pressure responsive means including a master controller connected to the boiler, and a variable flow variable pressure controller adapted initially to be actuated by pressure from said source of constant pressure, a reactance

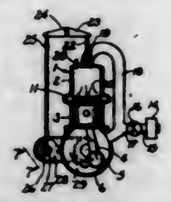
pressure producing means, means for causing said reactance pressure producing means to be regulated by said feeding means so that the pressure produced by said reactance pressure producing means depends upon the degree of activity of said

feeding means, and means forming a part of said variable flow variable pressure controller responsive to said reactance pressure adapted for stabilizing the operation of said steam pressure responsive means.



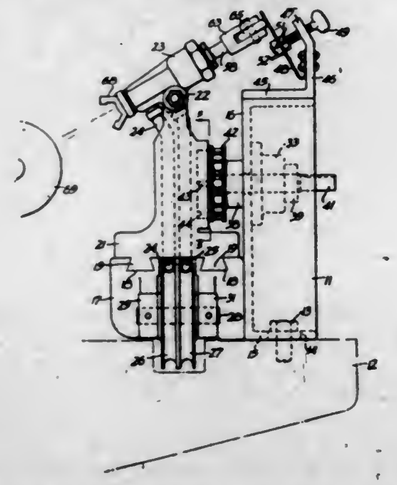
2,408,446
CONTROL MECHANISM
James V. Ralston, Elyria, Ohio, assignor to Bendix-Westinghouse Automotive Air Brake Company, Elyria, Ohio, a corporation of Delaware
Application September 6, 1944, Serial No. 552,891
7 Claims. (Cl. 74—512)

1. Actuating mechanism for a movable member comprising a pivotally mounted lever, a pair of spaced bearings on the lever, a torsion spring rod rotatably mounted in said bearings, a second lever mounted on one end of the spring rod for rotation therewith having its end in engagement with the member, a third lever mounted on the other end of the spring rod for rotation therewith, and an adjusting screw carried by said first named lever and adapted to engage said third lever for adjusting the angular position of the latter with respect to the first named lever.



2,408,447
APPARATUS FOR SEALING CONTAINERS
Harry A. Rau, Baltimore, Md., assignor to Crown Cork & Seal Company, Inc., Baltimore, Md., a corporation of New York
Application December 27, 1940, Serial No. 371,961
2 Claims. (Cl. 226—82)

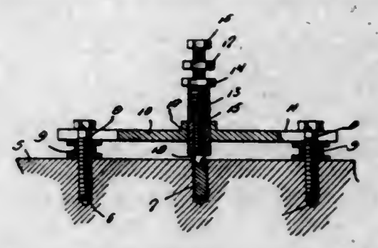
1. In a container capping apparatus, a base, a straight-line steam tunnel mounted on said base, said tunnel including a top wall and two side walls to define an inlet and an outlet at the respective opposite ends of said walls, conveyor means carried by said base to move containers through the tunnel, the top wall of the tunnel being positioned to lie closely adjacent the mouths of the containers, means carried by and below the tunnel top wall to apply and seal caps upon containers, a steam duct fixed with respect to a side wall of said tunnel in advance of the cap applying means, means to deliver steam to said duct at a relatively low pressure above atmospheric pressure, pressure reducing means in said duct to reduce the pressure of steam flowing therefrom to substantially atmospheric pressure, said duct including an outlet mouth positioned at one side of said conveyor and below but closely adjacent the plane of the cap applying and sealing means, said outlet mouth facing upwardly



and in the direction in which said conveyor means moves containers through said tunnel, said steam supply means, pressure reducing means and the facing direction of the duct mouth having the combined function of maintaining a quiet body of steam in the area occupied by said applying and sealing means and with the body of steam extending from the top wall of the tunnel to a point below and closely adjacent the plane of the container mouths, said tunnel being vertically adjustable with respect to said base and conveyor and means cooperating with a wall of said tunnel to move said tunnel and duct vertically with respect to said base and thereby enable containers of various sizes to be capped.

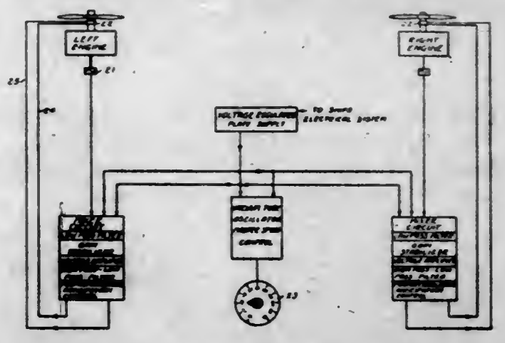
2,408,448
TWO-CYCLE ENGINE
Allen M. Rossman, Wilmette, Ill.
Application April 8, 1944, Serial No. 530,199
3 Claims. (Cl. 123—73)

3. In combination with an internal combustion engine having a cylinder and a piston reciprocable therein, an exhaust valve, a fuel-air chamber, means for filling the chamber with a fixed amount of fuel-air mixture at a constant pressure during each cycle of operation of the engine, a communication connection between the chamber and the cylinder at a point therein remote from the exhaust valve, valve means for controlling said communicating connection, and means for operating the valve means to extract some of the fuel-air mixture from the cylinder and return it to said chamber, said last means comprising a cam controlled by the position of the piston in the cylinder for operating the valve means during a portion of the movement of the piston in its compression direction after closing of the exhaust valve whereby movement of the piston forces a part of the fuel-air mixture in the cylinder to return to said chamber, and means manually operable during operation of the engine for varying the time of closing of the valve means in relation to the position of the piston to vary the amount of the fuel-air mixture extracted from the cylinder during each cycle of operation of the engine.



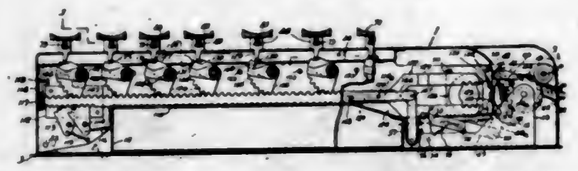
2,408,449
FLUID FOUNTAIN FOR PRINTING PRESSES
George M. Russell, Millbrae, Calif.; Anne Russell, administratrix of said George M. Russell, deceased, assignor to Pacific Can Company, San Francisco, Calif., a corporation of Nevada
Application September 13, 1943, Serial No. 502,093
6 Claims. (Cl. 101—147)

1. In a printing press, the combination of a frame; a removable printing means mounted therein, said printing means having spaced-apart ink-repellant areas thereon; dampening means in rolling contact with said printing means; means for applying an ink-repellant material to said dampening means in amounts and in spacing to conform substantially to said spaced-apart ink-repellant areas on said printing means, said means including a spraying head which moves back and forth across said dampening means, a deformable cam means arranged adjacent the path of travel of said head to control the amounts and spacing of said ink-repellant material applied thereon, and adjustable means for changing the shape of said cam means as required, whereby the amount and spacing of the ink-repellant spray may be made to conform substantially to the ink-repellant areas on said printing means.



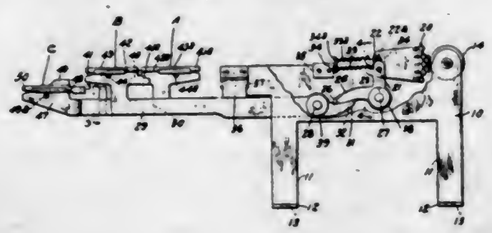
2,408,450
BROKEN STUD REMOVER
Raymond D. Schrader, Peoria, Ill., assignor to V. Ray Van Wey, Pekin, Ill.
Application March 24, 1944, Serial No. 527,983
1 Claim. (Cl. 81—71)

A broken stud remover comprising a bridge member, slots in each end of said bridge member, bolts positioned in said slots and adapted for securing said bridge member to the work at opposite sides of a broken stud to be removed from said work, removable spacing members on the bolts for spacing said bridge member above the work, a threaded opening in said bridge member intermediate its ends, an internally and externally threaded sleeve threaded in said opening



and having a tool engaging head for threading the sleeve into and out of position, a screw threaded in said sleeve and having a tool engaging head at one end and means at the other end of the screw adapted for biting into the broken stud.

2,408,451
SPEED CONTROL SYSTEM
Edward M. Sorensen, Dayton, Ohio
Application December 23, 1940, Serial No. 371,368
9 Claims. (Cl. 60—97)
(Granted under the act of March 3, 1883, as amended April 30, 1928; 370 O. G. 757)

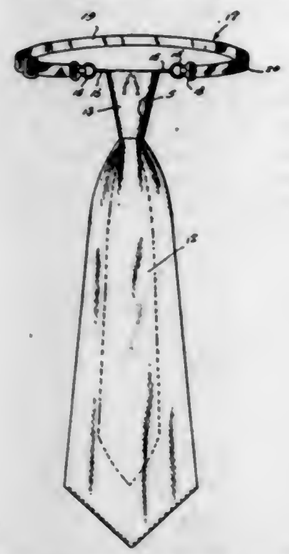


5. A system for synchronizing the speed of rotation of a plurality of prime movers comprising means for generating a voltage of predetermined frequency; an alternator operatively connected with each of said prime movers for generating a voltage having a frequency proportional to the speed of rotation of the prime mover; and means associated with each of said prime movers for maintaining a predetermined speed of operation thereof, said means including a mixing circuit for combining the two aforementioned voltages so as to produce a beat frequency voltage, a frequency analyzing circuit for signifying the deviation of said beat frequency from a predetermined value, and a proportionalizing control circuit for correcting the speed of the prime mover to bring the beat frequency back to said predetermined value, said last named circuit including a pair of circuits each adapted to produce electrical pulses at a rate proportional to the extent of deviation of said beat frequency from said predetermined value, one of said circuits being operable to produce pulses when the deviation is above said predetermined frequency, and the other of said circuits being operable to produce pulses when the deviation is below said predetermined frequency, a relay connected with each of said pulse producing circuits, and an electrical device controlled by said relays for increasing or decreasing the load on the prime mover in accordance with and in proportion to the increase or decrease of the speed thereof from said predetermined speed.

2,408,452
SHORTHAND TYPEWRITING MACHINE
John L. Stixrud, Los Angeles, Calif.
Application November 8, 1943, Serial No. 509,514
11 Claims. (Cl. 197—9)

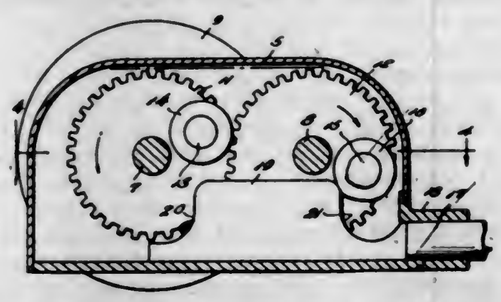
6. In a machine of the kind described, in combination, a rotary typing wheel having a plurality of type characters spaced on the peripherial surface thereof, a selectively actuated tiltable operating key to perform a selecting operation by its own movement in one of two directions, a pair of longitudinally movable bars operatively connecting the operating key with the typing wheel, the movement of one of said bars by the initial portion of the depression of said key during one selective tilting selecting the type to be presented and the movement of both of said bars by the full depression of said key during said one selective tilting moving the typing wheel into printing position in accordance with the selective movement of the operating key, and intervening mechanism operatively connecting said typing wheel, movable bars and operating key to carry out a printing operation.

2,408,453
SHORTHAND TYPEWRITING MACHINE
John L. Stixrud, Los Angeles, Calif.
Application January 13, 1945, Serial No. 572,588
11 Claims. (Cl. 197—9)



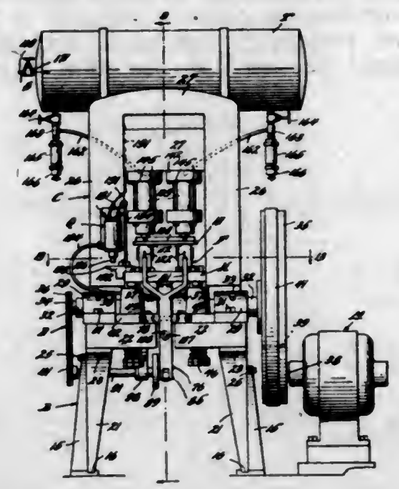
3. In a machine of the character described, comprising a plurality of printing members each bearing a series of printing characters, a pair of actuating levers each having a pivotal connection with a printing member arranged therebetween wherein one pivotal connection is vertically spaced above the other, a pair of key bars each operatively connected to one of said actuating levers, and a plurality of keys coupled in pairs to actuate the key bars first individually to cause an initial selection and then jointly to cause a final printing of the characters on said printing member.

2,408,454
DECOLORIZING OILS AND AGENTS THEREFOR
Francis Michael Sullivan, North Bergen, N. J.
No Drawing. Application July 16, 1941, Serial No. 402,696
10 Claims. (Cl. 210—62)



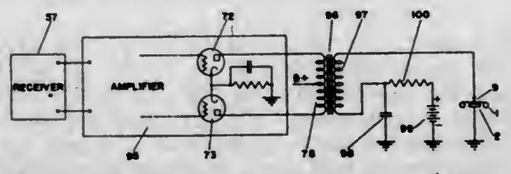
1. The method of treating a glyceride oil containing its natural color bodies to decolorize the same which comprises intimately contacting said glyceride oil with a preformed hydrous alkali metal soap of saturated and unsaturated fat acids, the unsaturated fat acid constituting at least 30% of the soap forming acids, and the amount of saturated fat acid being sufficient to produce ready separability of the soap from the oil, the soap being dispersed through the oil in finely divided condition, the soap being separable from the oil, and separating the soap carrying the color bodies from the treated oil.

2,408,455
NECKTIE
Alfred F. Tabotski, Buffalo, and Joseph W. Terry, Niagara Falls, N. Y.
Application March 24, 1944, Serial No. 527,939
4 Claims. (Cl. 2—150)



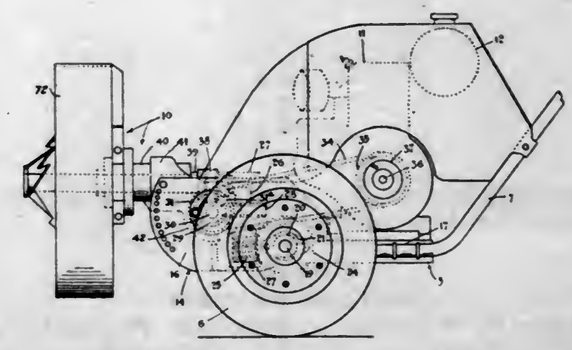
1. A necktie comprising a rigid hollow form shaped to represent the knot portion of a four-in-hand necktie, a drape portion, a removable extension attacked to the upper end of said drape portion, and a pair of spring fingers attached to the upper end of the said removable extension and adapted for releasable engagement in the knot form.

2,408,456
DRIVE MECHANISM
William H. Thomason, Margret, Ga.
Application July 15, 1944, Serial No. 545,081
1 Claim. (Cl. 74—49)



Means for converting rotary into reciprocating motion and comprising a pair of shafts, means for driving one of said shafts, interengaged gears secured to the shafts for rotation in opposite directions, a slidably supported member including a laterally projecting head and means eccentrically carried by the gears and engageable with opposite edges of the head to move the latter in opposite directions, said member being slidable in a fixed path, said means last-mentioned comprising a pair of rollers revolved by said gears into engagement with said head alternately and each disengaging said head when the other is engaged therewith.

2,408,457
LOCK NUT MAKING MACHINE
Chester D. Tripp, Chicago, Ill.
Application January 7, 1944, Serial No. 517,409
24 Claims. (Cl. 10—72)

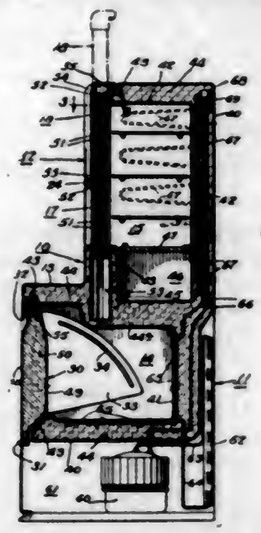


1. A machine for making lock nuts of uniform gripping or locking force from nuts of varying height and density formed by standard quantity production methods, comprising a pair of members mounted for relative movement toward each other and operable to press a nut therebetween, one of said members being adapted to support said nuts and the other comprising shallow means of rapidly varying area operable to indent a face of a supported nut and modify the helix angle of a portion of the threads of said nut in proportion to the depth and area of indentation; driving means for imparting a reciprocating movement to one of said members, to bring the members into pressing relationship with the nut; and additional means for applying pressure of predetermined value to one of said members in opposition to said driving means to limit further relative movement of said members and assure indentations of substantially identical depth and area with a substantially identical modification in thread helix angle and a uniform gripping force in nuts of varying height and density.

2,408,458
APPARATUS FOR ECHO DISTANCE MEASUREMENT
Edwin E. Turner, Jr., West Roxbury, Mass., assignor, by mesne assignments, to Submarine Signal Company, Boston, Mass., a corporation of Delaware
Original application January 5, 1940, Serial No. 312,504. Divided and this application July 25, 1941, Serial No. 404,052
6 Claims. (Cl. 234—1.5)

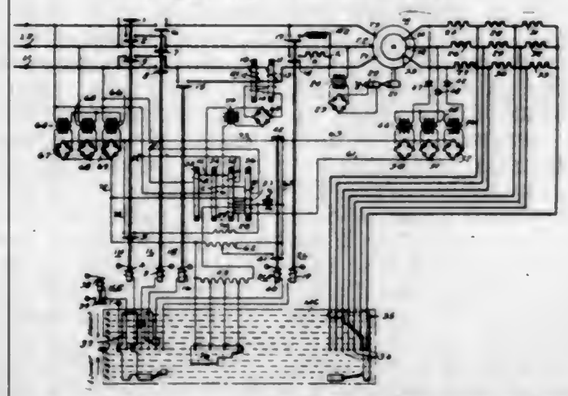
4. In an echo distance measuring system of the type in which the time interval is measured between direct and reflected signal impulses, the reflected impulse having an intensity which decreases as the length of the time interval being measured increases, the combination of an exhibitor for exhibiting the moment of receipt of the reflected impulse, said exhibitor having an exhibiting element requiring at least a minimum potential for operation, means for applying directly to the exhibiting element a potential substantially constantly proportional to the intensity of the reflected impulse, and means for applying directly to the exhibiting element in aid of the reflected impulse potential a potential which increases with the length of the time interval being measured.

2,408,459
PORTABLE POWER-DRIVEN CONVEYER
Alfred C. Tuttle, Montreal, Quebec, Canada
Application December 30, 1944, Serial No. 570,551
7 Claims. (Cl. 37—53)



1. A machine of the character described comprising a portable frame, a transversely extending shaft rotatably journalled in said frame, means for driving said shaft, an adjustable bearing housing extending in a direction at right angles to said shaft and mounted for swinging movement about a center coinciding with the central longitudinal axis of said shaft, a spindle extending through said housing and rotatably carried thereby, means for driving said spindle from said shaft in all adjusted positions to which the housing is swung about said shaft, a conical disc carried by a portion of the spindle projecting from the end of the housing remote from said shaft, a plurality of radial paddles secured to said spindle and said disc and a plurality of vanes arranged around said spindle to conjointly provide a screw conveyer for conveying material along said spindle in the direction of said paddles, said vanes being secured to said spindle and to said disc and means for retaining said housing in any of the various positions to which it is swingable about said shaft.

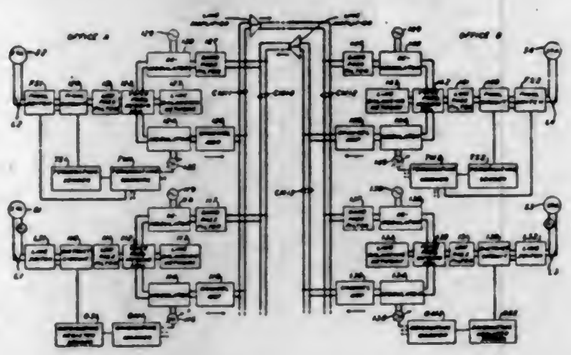
2,408,460
REFRIGERATOR
Harold van Doren, Bryn Mawr, Pa., assignor, by mesne assignments, to Philco Corporation, Philadelphia, Pa., a corporation of Pennsylvania
Application March 30, 1944, Serial No. 528,741
3 Claims. (Cl. 62—89)



1. In a refrigerator, a cabinet having upper and lower compartments and an intervening insulated wall, said upper compartment having a side access opening and said wall having a section of major thickness extending upwardly at the open side of said upper compartment so as to form in the bottom of the latter a well-type chamber, said wall section being recessed from the top, a closure member for the access opening of said upper compartment movable vertically in the cabinet structure to and from an open position within said recess, a primary refrigerating system associated with said lower compartment for cooling

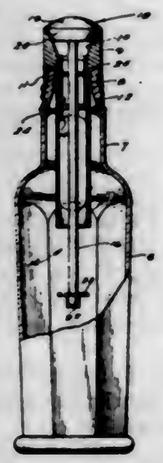
the same, and a secondary refrigerating system in heat exchange relation with said primary re-

frigerating system and associated with said upper compartment for cooling the latter.



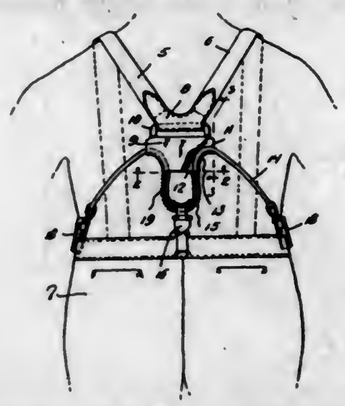
2,408,461
CONTROL SYSTEM
William R. Wickerham, Swissvale, Pa., assignor to Westinghouse Electric Corporation, East Pittsburgh, Pa., a corporation of Pennsylvania
Application January 1, 1945, Serial No. 570,945
13 Claims. (Cl. 172—274)

1. A motor control system, comprising a wound rotor motor having primary windings and secondary windings, multiphase current supply means for impressing alternating multiphase voltage on said primary windings, control means associated with said power supply means for varying the balance condition of said voltage, and circuit means disposed between said secondary windings and said control means for controlling the latter to operate in dependence upon the frequency of the secondary current induced in said secondary windings, said circuit means having transformer means operative at a high degree of iron saturation primarily connected across said secondary windings for deriving therefrom a control voltage determined substantially only by the frequency of said secondary current.



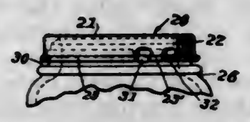
2,408,462
TELEPHONE SYSTEM
Raymond O. Wise, Short Hills, N. J., assignor to Bell Telephone Laboratories, Incorporated, New York, N. Y.
Application June 8, 1943, Serial No. 490,033
10 Claims. (Cl. 179—15)

1. In a telephone system, subscribers' lines, a plurality of high frequency carrier channel equipment units each comprising a modulator and a demodulator, means for individually connecting said units with subscribers' lines, amplifiers, one for each of said modulators, band-pass filters, one for each demodulator, for passing a different band of frequencies to each demodulator, a plurality of carrier current sources, a source of a different frequency for each demodulator, a multichannel transmission medium connected to



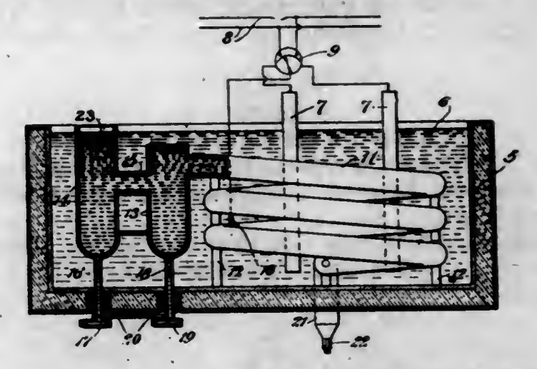
a plurality of said amplifiers, a multichannel transmission medium connected to a plurality of said filters, an amplifier interconnecting said multichannel media, and means including control means common to said units for selectively connecting to the modulator of any unit connected with a calling line a carrier source of the same frequency as that of the carrier source connected to the demodulator of a unit adapted to be connected to the called line.

2,408,463
BOTTLE STOPPER AND POURING SPOUT
Hubert B. Wright, Nashville, Tenn.
Application September 14, 1944, Serial No. 554,061
4 Claims. (Cl. 215—74)



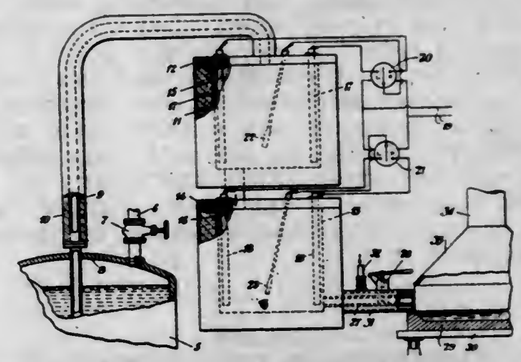
1. In a structure of the class described, in combination, a bottle having a neck, a cylinder mounted on the interior of the bottle and coacting with the neck, said cylinder having inlet slots, a rod slidable in said cylinder, a stopper on the outer end of said rod, said stopper being engageable with and movable toward and from the discharge mouth of said neck, and an open-ended sleeve on said rod, said sleeve telescoping into the outer end portion of said cylinder and being projectible to a point well beyond the bottle neck, whereby to deliver the contents of the bottle into the cylinder and then into the sleeve and from the sleeve when said sleeve is projected to a position well beyond the neck.

2,408,464
SUSPENDER
John La Frenier, Detroit, Mich.
Application May 17, 1944, Serial No. 535,992
2 Claims. (Cl. 2—331)



1. A trousers suspender comprising a pair of shoulder straps attachable at their front ends conventionally to the adjacent front waist portions of the trousers and converging toward their rear ends and being carried over the shoulders and downwardly at the back of the wearer, a rigid guide element connected supportedly and suspendedly to the rear ends of the shoulder straps, a cord slidably mounted intermediate its ends in the guide element and its central portion being looped and extended downwardly below the guide element, means for attaching the ends of the cord to the opposite sides of the trousers at the waist portions thereof, single means for attaching the loop of the cord releasably to the rear middle of the trousers waist portion, and spring means carried by the cord loop and urging the loop downwardly and normally holding the same yieldably in extended position.

2,408,465
CONTAINER CAP
Louis L. Lauve, Baltimore, Md., assignor to Crown Cork & Seal Company, Inc., Baltimore, Md., a corporation of New York
Application May 1, 1942, Serial No. 441,357
4 Claims. (Cl. 215—38)

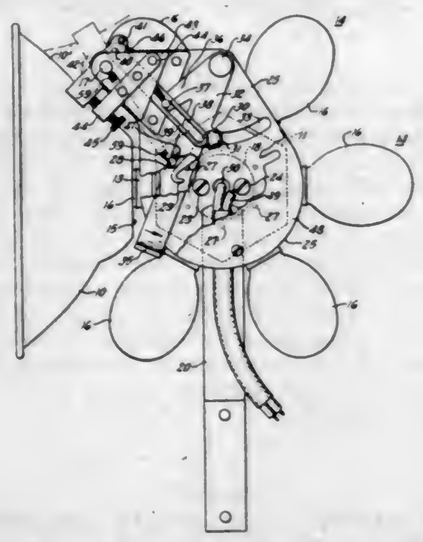


1. A snap-on and pry-off cap including a top and a resilient substantially cylindrical skirt depending from said top and including a continuous curled bottom edge, said skirt being provided with three only of substantially equi-distantly spaced sets of two inwardly projecting lugs of which each lug of each set has an upper portion which inclines gradually outwardly and upwardly relative to the inner surface of the skirt above said edge and merges into said surface a distance above said edge and has a lower portion in said edge inclined gradually downwardly and outwardly relative to said inner surface, said lugs being each engageable with point contact under a container locking ring of substantially less maximum diameter than the maximum inside skirt diameter when the cap is applied, said lower and upper portions affording a shoehorn effect in the cap applying and removing operations respectively, each lug having an inward curve in the plane of said edge and the adjacent ends of the curves of the lugs of each set being immediately joined by an outwardly curved portion of said edge, and the distance between adjacent sets of lugs being at least twice the distance between the contact points of the lugs of each set.

2,408,466
MELTING MAGNESIUM METAL AND THE LIKE
Ellis C. Lyons, Boulder City, Nev., assignor, by mesne assignments, to Reconstruction Finance Corporation, a corporation of the United States
Application November 9, 1944, Serial No. 562,722
7 Claims. (Cl. 266—33)

1. An apparatus of the character described comprising an elongated and substantially closed molten metal reservoir submerged in a fused bath without communication between the interior of said reservoir and the material of said bath, means operatively associated with said bath for maintaining the molten metal in the reservoir within a predetermined temperature range, a valve controlled discharge means operatively connected to one end of said reservoir, and means operatively associated with the other end of said reservoir for introducing molten metal into the reservoir when molten metal is discharged from the reservoir.

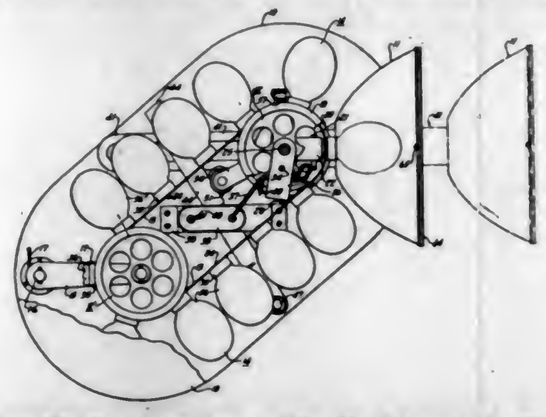
2,408,467
CONDITIONING MOLTEN METAL
Ellis C. Lyons, Boulder City, Nev., assignor, by mesne assignments, to Reconstruction Finance Corporation, a corporation of the United States
Application November 10, 1944, Serial No. 562,863
7 Claims. (Cl. 22—200)



1. The improvement in conditioning an easily oxidized metal for casting which comprises transferring molten metal without contact with air from beneath the surface of a body of the molten metal to an elongated conduit, heating the molten metal in the conduit to a temperature within a predetermined range above the temperature of the body of molten metal, and withdrawing molten metal at a temperature within said range from the conduit simultaneously with the transfer as aforesaid of an equivalent amount of molten metal to the conduit.

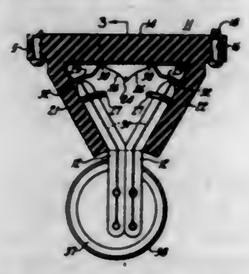
2,408,468
GLASS COMPOSITION
Kenneth C. Lyon, Millville, N. J., assignor to General Electric Company, a corporation of New York
No Drawing. Application December 3, 1942, Serial No. 467,813
2 Claims. (Cl. 106—54)

1. A borosilicate seal glass adapted for fusion by passage of electric current through it while heated, and characterized by a lithia content of only a minor fraction of a per cent and by essential freedom from alkali other than lithia, whereby it is rendered conductive when heated without substantial increase of its thermal expansion.



2,408,469
MULTIFLASH LAMP DEVICE
John J. Malloy, Cleveland Heights, Ohio, assignor to General Electric Company, a corporation of New York
Application November 1, 1943, Serial No. 508,480
8 Claims. (Cl. 240—37)

2. A multiple flash lamp device comprising a concave reflector of sufficient depth to substantially surround and enclose a flash lamp and having an axis, rotatable means for supporting a plurality of flash lamps and advancing them successively first into and then, after being flashed, out of said reflector through the position normally occupied by the reflector, said means being arranged for rotation about an axis perpendicular to a plane including said reflector axis, means supporting said reflector and said lamp supporting means in juxtaposition, and means for displacing said reflector out of the path of movement of said lamps upon actuation of the lamp advancement means.

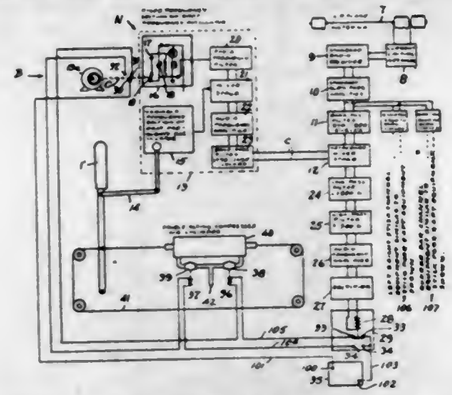


2,408,470
MULTIFLASH LAMP DEVICE
Edward B. Noel, Cleveland Heights, and August W. Seitz, Euclid, Ohio, assignors to General Electric Company, a corporation of New York
Application November 1, 1943, Serial No. 508,494
6 Claims. (Cl. 240—37)

6. A multiple flash lamp device comprising lamp support means arranged to support a lamp carrier comprising a strip carrying a plurality of flash lamps, a concave reflector movably supported adjacent said lamp support means and of sufficient depth to normally surround and enclose one of said lamps, a light filter disposed over and substantially closing the mouth of said reflector, actuating means engageable with the lamp carrier and the reflector to synchronous advancement of said lamp carrying strip on said lamp support means to move successive lamps first into and then, after being flashed, out of

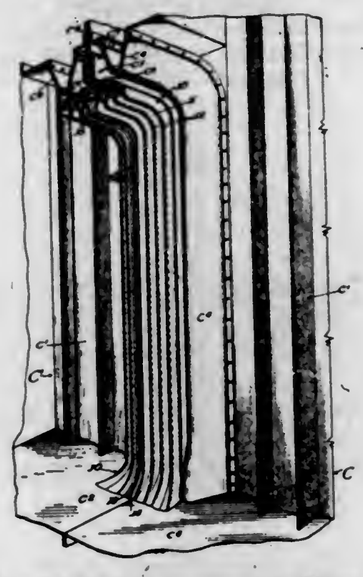
said reflector together with displacement of the reflector out of the path of movement of the lamps during each advancement thereof, and means supporting said lamp support means, said reflector and said actuating means in juxtaposition.

2,408,471
ILLUMINATING APPARATUS
George S. Merrill, Cleveland, Ohio, assignor to General Electric Company, a corporation of New York
Application June 3, 1943, Serial No. 489,449
4 Claims. (Cl. 173—328)



1. A lamp holder for supporting one end of a pair of electric lamps extending in opposite directions therefrom, comprising the combination of a socket having a chamber therein with opposed walls diverging upwardly from an opening in the bottom thereof, a pair of detachable angular connector members having vertical portions projecting downwardly from said socket opening in side-by-side relation and angularly offset portions each engaging one of said opposed chamber walls, the vertical portions of said connector members each being provided with engagement means to hold an end of a lamp, and clamping means in said chamber adapted to grip the angularly offset portions of said connector members and hold them against said opposed chamber walls.

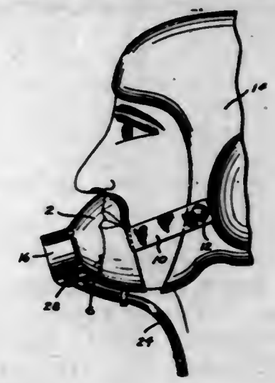
2,408,472
ELECTRICAL SYSTEM FOR THE CONTROL OF MECHANICAL DEVICES
John J. Moynihan, Boston, Mass., assignor of one-half to Joseph B. Brennan, Cleveland, Ohio
Application August 28, 1941, Serial No. 408,658
19 Claims. (Cl. 250—2)



1. In apparatus for the comparison of two commensurable properties, within a predetermined range of variation of a parameter thereof, the combination of means for selecting from one a

standard of value and means for simultaneously comparing together values indicated by the two respectively while cyclically varying the value of

the parameter of one of said properties and means for determining whether the parameter of the other property lies within such range.

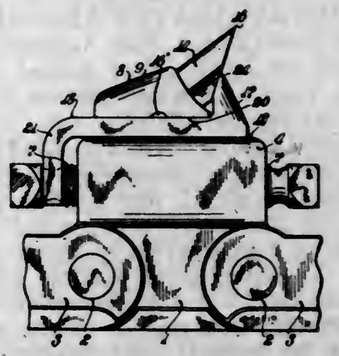


2,408,473
DUST SEAL FOR ADJOINING RAILROAD CARS
Clarence P. Nelson, Chicago, Ill.
Application June 21, 1945, Serial No. 600,711
8 Claims. (Cl. 105—20)

1. A seal adapted to prevent infiltration of dust and other matter between the abutting frame-like outer diaphragm plates of a pair of coupled-together vestibule variety railroad cars and comprising a pair of complemental separately formed opposed strip-sections formed of flexible, dust and fluid impervious material, extending around the inner marginal portions of the top and side parts of the diaphragm plates, having certain of the side margins thereof connected to said marginal portions, respectively, and provided on the other side margins thereof with quickly and readily releasable means for connecting them together.

2,408,474
NOISE SHIELD FOR TRANSMITTER MOUTHPIECES
Edwin B. Newman and Joseph Miller, Cambridge, Mass.
Application December 29, 1944, Serial No. 570,354
5 Claims. (Cl. 179—188)

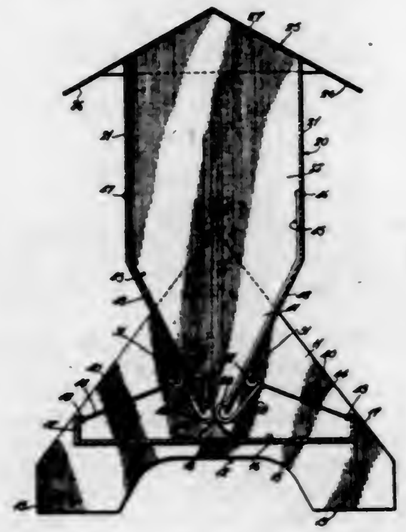
1. An article of the character described comprising an enclosure member adapted to overlie the face at points adjacent the lips, said enclosure being of a generally cup-like formation and presenting along its upper side a rolled edge for compliantly sealing with an upper lip, said enclosure further presenting a chin rest at the lower portion thereof, said chin rest being a con-



tinuation of the rolled edge, the enclosure having an inwardly extending chin seating portion adapted to underlie the chin, a microphone socket portion formed at the outer side of the enclosure, and air passage means located through the said socket portion.

2,408,475
FLUORESCENT ZINC OXIDE
Clifford A. Nickle, Schenectady, N. Y., assignor to General Electric Company, a corporation of New York
No Drawing. Application July 18, 1941, Serial No. 403,067
2 Claims. (Cl. 252—301.6)

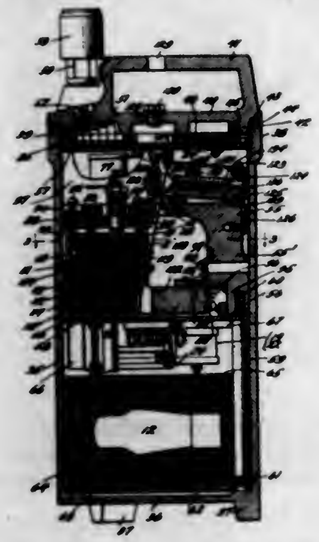
2. A phosphor consisting essentially of a zinc oxide matrix with substantially one per cent of bismuth in activating relation to said matrix, whereby the same is rendered excitable to fluorescence, and further characterized by a marked white-light fluorescence, in response to long-wave ultraviolet and cathode rays, which has been induced by heat treatment in hydrogen at substantially 1000° C. followed by rapid cooling in the open air, as contrasted with only an insignificant, faint fluorescence arising from heat treatment without reducing influence.



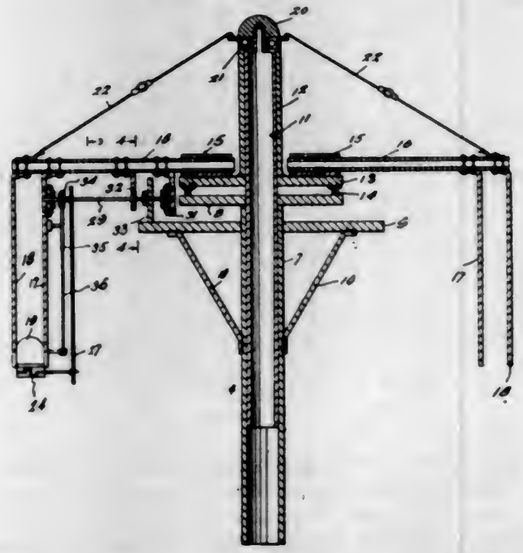
2,408,476
CUTTER CHAIN
Charles F. Osgood, Claremont, N. H., assignor to Joy Manufacturing Company, a corporation of Pennsylvania
Application March 23, 1942, Serial No. 435,805
7 Claims. (Cl. 262—33)

1. In a cutter chain, a chain block having a socket, a bit holder having a shank receivable in the socket of said block, a bit clamp cooperating with said holder and having a longitudi-

nally extending portion resting on an outer surface of said block when the clamp is in operative position, said holder having side portions engaging the sides of the longitudinally extending portion of said clamp for holding said clamp against said block surface and for guiding the latter during adjustment thereof relative to said holder and said block in a direction lengthwise of said block, means for securing said holder on said block, means separate from said securing means for adjusting said bit clamp longitudinally into bit clamping position relative to said holder and said block, and a cutter bit mounted on said holder and engageable by said bit clamp.



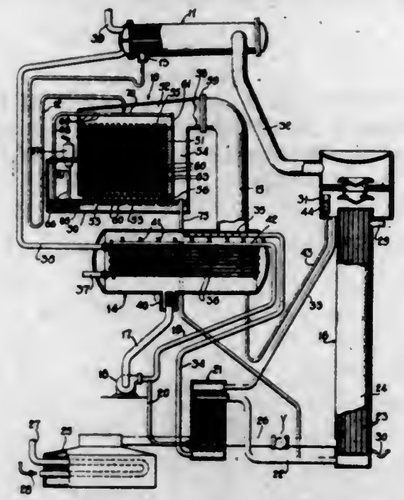
2,408,477
POULTRY FEEDER
Robert T. Payne, Upland, Calif.
Application February 9, 1945, Serial No. 577,017
8 Claims. (Cl. 119—54)



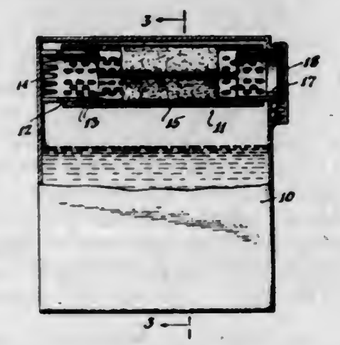
1. A poultry feeder comprising a trough, a hopper having a narrow elongated opening in the bottom thereof, means supporting the hopper above the trough, a screen through which the heads of the poultry must pass to obtain the feed in the trough, and means supporting the inner end of the screen, said supporting means extending through the elongated opening and into the hopper and adapted to agitate the feed at the opening for aiding in discharging the feed from the hopper, said screen being agitated during feeding.

2,408,478
SEISMIC APPARATUS AND METHOD
Olive Scott Petty, San Antonio, Tex.
Continuation of application Serial No. 324,013, March 14, 1940. This application November 17, 1943, Serial No. 510,685
19 Claims. (Cl. 177—352)

15. In a portable seismometer of the type employing elements which are readily displaceable on application thereto of seismic wave energy, in combination, a housing, an element rigidly supported in the housing, a second element supported in the housing for movement relative to said first element, and means mounting said second element to permit such relative movement, said means including a steady-mass carrying said second element, said steady-mass being hinged to the housing on an axis laterally spaced from said elements, the hinged axis being disposed substantially in the horizontal plane containing the center of gravity of the steady-mass, whereby the seismometer is unresponsive to horizontal components of seismic waves.

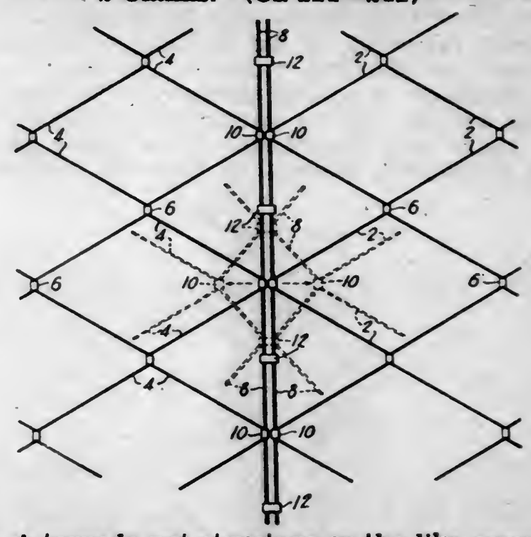


2,408,479
ROUNDABOUT
George Henry Pooler, Marietta, Ohio
Application March 1, 1945, Serial No. 580,350
7 Claims. (Cl. 272—33)



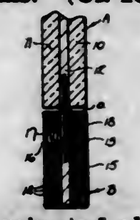
1. A roundabout comprising a fixed upright, a sleeve carried on the upper end thereof, a turntable connected to the sleeve, radially disposed arms fixed to the turntable, seats swung from the arms, means whereby the turntable may be manually rotated, a cap rotatably mounted atop the upright and brace rods connecting the cap to the reach end of said arms, a disk fixed upon said upright and upon which the turntable operates, said means including a horizontal shaft, a sprocket wheel fixed thereon, a treadle connected to a seat and having a shaft, a sprocket wheel mounted fixedly on the last shaft, a relatively large friction disk fixed on the upright and a wheel on the first shaft and engaging the large disk, means whereby the occupant of any seat may brake the roundabout, and said last means including a brake drum on the first shaft and a control member depending to the seat.

2,408,480
EVAPORATOR FOR LOW-PRESSURE REFRIGERANTS
John G. Reid, Jr., Evansville, Ind., assignor to Servel, Inc., New York, N. Y., a corporation of Delaware
Application January 3, 1945, Serial No. 571,167
5 Claims. (Cl. 62—119)



1. An evaporator for use in a refrigeration system having an upper header provided with a horizontal tube sheet, a lower header, a plurality of vertical tubes extending between the upper and lower headers and projecting above the horizontal tube sheet of the upper header, means for supplying liquid refrigerant to the upper header which overflows into the end portions of the tubes projecting above the tube sheet, said tubes having internal serrations to retard the flow of refrigerant through the tubes to maintain a film of liquid refrigerant on the interior surfaces thereof, and means for recirculating liquid refrigerant from the lower to the upper header.

2,408,481
CIGARETTE CONDITIONER
Willard Reid, New York, N. Y.
Application August 17, 1944, Serial No. 549,890
5 Claims. (Cl. 91—62.5)

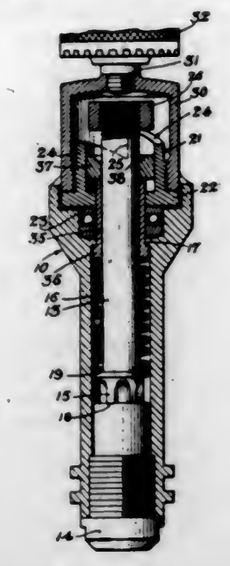


1. In a cigarette conditioning device a liquid container and a cigarette conditioner communicating therewith internally and having an opening externally thereof, said conditioner comprising a tubular member having a plurality of wall orifices intermediate its ends and serrations at its inner end providing an opening directly into said container and a sleeve-like covering of absorbent material intermediate its ends, said covering having portions bulged through said wall orifices to form absorbent nodules inside said tubular member.

2,408,482
TORPEDO NET
Harvey W. Riddle, Branford, Conn., assignor to The American Steel and Wire Company of New Jersey, a corporation of New Jersey
Application March 6, 1945, Serial No. 581,305
2 Claims. (Cl. 114—241)

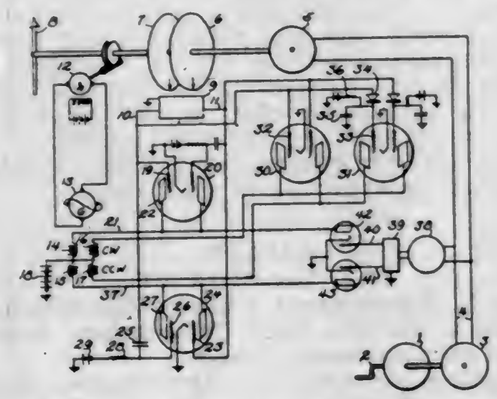
1. A torpedo net structure or the like comprising a plurality of sections and a shock absorbing seam between at least two of said sections, said shock absorbing seam comprising two substantially parallel stranded wire structures, a plurality of spaced apart connections between one of said wire structures and one section, a plurality of spaced apart connections between the other wire structure and the second section, and connecting means spaced from the said connections for fastening the wire structures together.

2,408,483
LAMINATED GLASS STRUCTURE
Frank A. Rodman, Toledo, Ohio, assignor to Libbey-Owens-Ford Glass Company, Toledo, Ohio, a corporation of Ohio
Application March 28, 1942, Serial No. 436,605
7 Claims. (Cl. 189—76)



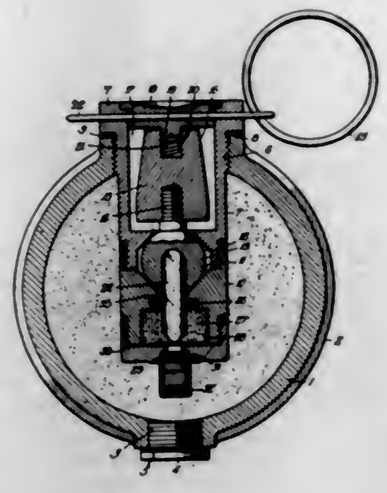
3. An integral laminated glass glazing unit for mounting in a frame, comprising two sheets of glass and an interposed layer of thermoplastic adherent thereto and extending outwardly beyond the edges of the glass sheets, and a metal sheath in the form of a channel member fitting over the extended portion of the plastic interlayer and secured thereto, said metal sheath being spaced from the peripheral edges of the glass sheets and forming with the extended portion of the plastic interlayer a metal covered flexible attaching flange for clamping in said frame.

2,408,484
PERCUSSIVE TOOL
Arthur R. Schwarzkopf, Chicago, Ill., assignor to Wodack Electric Tool Corporation, Chicago, Ill., a corporation of Illinois
Application November 6, 1943, Serial No. 509,311
8 Claims. (Cl. 255—42)



1. A hammer attachment for rotary drills comprising, in combination, an elongated barrel

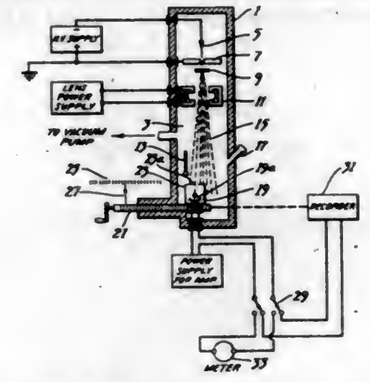
adapted to be mounted on the drill and having a tool socket, an impact member reciprocable axially in the barrel in operative relation to the socket, means forming shoulders adjacent opposite ends of said member, a pair of spaced abutments in said barrel, a collar loosely mounted on said member and abutting against the shoulder adjacent one end of the member, a flanged sleeve slidably mounted on the member and abutting against the shoulder adjacent the other end of the member, a spring interposed between said collar and said sleeve operative to yieldably urge the collar and the flange of the sleeve against said abutments whereby to hold the member in



a central position in the barrel, power driven means acting on said member to retract the same from the socket, the shoulder at said one end of said member engaging said collar in the retraction of the member to compress said spring between said collar and said sleeve, said spring acting through said collar and said shoulder upon the release of the member to advance it rapidly toward the socket, said sleeve being engaged by the shoulder adjacent the other end of said member for movement therewith at a predetermined point in its advance and said spring acting to resist such movement of the sleeve and thereby bring the member to a cushioned stop.

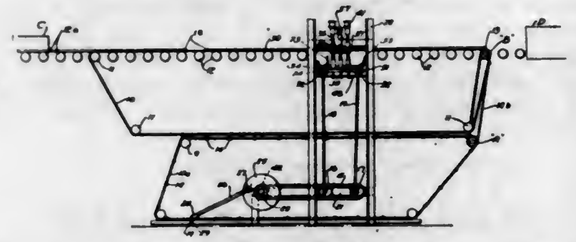
2,408,485
POSITION CONTROL SYSTEM
Judson O'D. Shepherd, Atlanta, Ga.
Application April 6, 1942, Serial No. 437,837
16 Claims. (Cl. 172—239)

1. In a position reproducing system, a master positionable device, a secondary positionable device, means to produce signals corresponding to the position of the master device, driving means for the secondary device, control means responsive to deviation of the position of the secondary device from that called for by the signals to energize the driving means to drive the secondary device to eliminate the deviation and means to delay for a time interval the response of the control means to a deviation.



2,408,486
HAND GRENADE AND FUSE THEREFOR
Edward M. Shinkle, Burlington, Iowa
Application March 28, 1945, Serial No. 585,314
2 Claims. (Cl. 102—64)

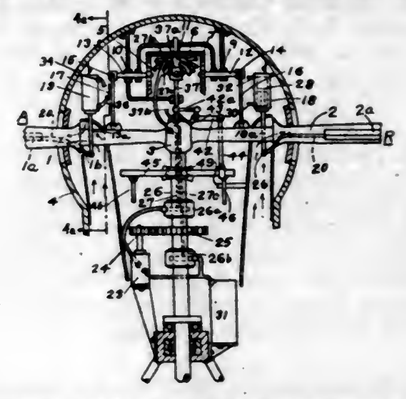
1. In a grenade or the like, a grenade body, a fuse assembly fitted therein, the assembly comprising a housing member and an intermediate member having opposed seats formed therein, a ball fitted on said seats, a weight secured to the ball, the housing member having a cavity formed therein enclosing the weight and permitting limited movement thereof, a removable closure for the cavity engaging the weight and preventing movement thereof, a frangible ampule secured to the ball normally spaced from adjacent fixed portions of the fuse, chemical means in the ampule and additional chemical means carried adjacent the ampule, the two chemical means when brought into contact serving to initiate an explosion of the grenade, the size relationship between the weight and its enclosing cavity being such that the weight upon release may move sufficiently to swing the ampule against adjacent fixed portions of the fuse and break the ampule to release its contents.



2,408,487
ART OF ASCERTAINING THE ATOMIC STRUCTURE OF MATERIALS
Perry C. Smith, Moorestown, N. J., assignor to Radio Corporation of America, a corporation of Delaware
Application February 29, 1944, Serial No. 524,424
4 Claims. (Cl. 250—49.5)

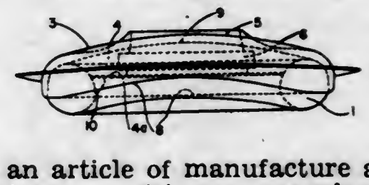
1. In combination, means for producing a diffraction ray pattern of a specimen in a plane spaced from said specimen, means mounted for movement along a radius of said pattern for converting the diffracted rays which fall along said radius into an electromotive force, and means for

measuring said electromotive force as a function of said radius.



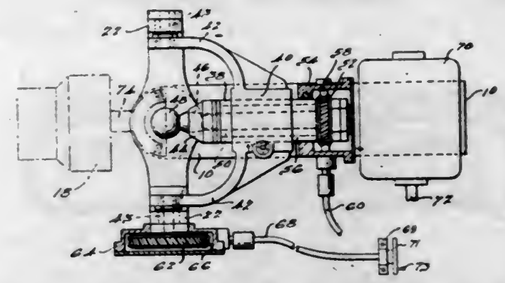
2,408,488
METHOD OF PERFORATING GYPSUM LATH
Louis N. Sorensen, Port Clinton, Ohio, assignor to The Celotex Corporation, Chicago, Ill., a corporation of Delaware
Original application June 8, 1939, Serial No. 278,212. Divided and this application August 27, 1941, Serial No. 408,430
9 Claims. (Cl. 164—125)

9. The method for perforating plaster board having a partially set cementitious core with adhered surfacing sheets which comprises the steps of positioning the plaster board on a support, intermittently advancing the plaster board along the said support, simultaneously reciprocating a plurality of annular knives to cut through the plaster board and receive in their open interiors plugs of the plaster board cut therefrom as a consequence of the reciprocation of such annular knives, the cut-out plugs then through continued reciprocatory movement of the annular knives ejected therefrom, the plaster board advanced and the annular knives reciprocated in timed relation whereby the annular knives are reciprocated only during the dwell period of the intermittent advance of the plaster board and the cut out plugs are ejected prior to the completion of the reciprocatory motion of the annular knives and further movement of the plaster board being intermittently advanced.



2,408,489
ROTARY WING AIRCRAFT
Edward A. Stalker, Ann Arbor, Mich.
Application January 28, 1942, Serial No. 428,531
14 Claims. (Cl. 244—17)

1. In an aircraft, in combination, a plurality of blades, means for mounting said blades for rotation about an upright axis and for independent vertical flapping about an axis separate transverse to said upright axis, means to vary the lifts of the respective blades, and means interconnecting each said blade with the lift varying means of a blade on the opposite side of said upright axis for controlling the lift of one blade

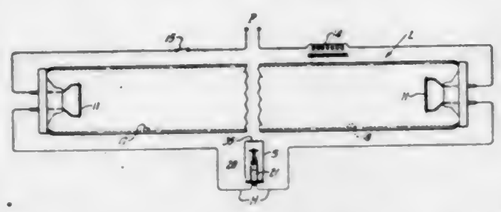


by a function of flapping of another blade on the opposite side of said vertical axis and independently of the flapping position of said one blade.

2,408,490
EARPHONE SOCKET
Stanley Smith Stevens, Cambridge, Mass., assignor to the United States of America, represented by the Executive Secretary of the Office of Scientific Research and Development
Application April 18, 1944, Serial No. 531,684
3 Claims. (Cl. 179—156)

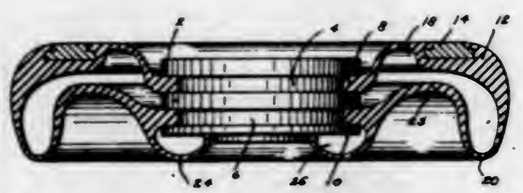
3. As an article of manufacture a sound control device comprising an earphone, a socket member having the earphone centrally supported therein, a sealing ring mounted at the inner side of the socket in spaced relation to the earphone, said socket consisting of a cup-like member of insulating material extending across and overlying the sealing ring, said sealing ring being embedded more deeply at one side of the socket than the other.

2,408,491
WORK HOLDING FIXTURE
Elwin M. Strickland, Detroit, Mich., assignor of one-half to Albert F. Wall, Grosse Pointe, Mich.
Application November 24, 1943, Serial No. 511,590
7 Claims. (Cl. 51—97)



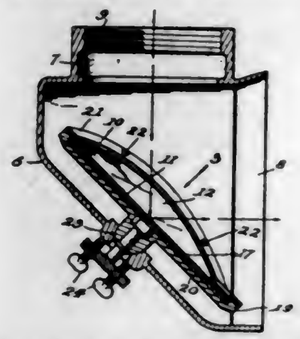
1. A work holding fixture for forming spherical surfaces comprising two yokes having spaced arms, connecting means between said arms, means to oscillate one of the yokes about its longitudinal axis, means to oscillate the other yoke about the intersection of said arms, a work holder carried by one of the yokes to position a piece of work at the intersection of the yokes, and a finishing tool positioned to engage the work.

2,408,492
MANUFACTURE OF SULPHAMIC ACID
Ernest J. Tauch, Cleveland Heights, Ohio, assignor to E. I. du Pont de Nemours & Company, Wilmington, Del., a corporation of Delaware
No Drawing. Application January 8, 1943, Serial No. 471,743
8 Claims. (Cl. 23—166)



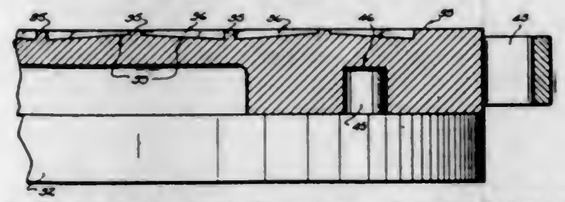
2. In a process for producing sulphamic acid from urea, sulphuric acid, and sulphur trioxide, the steps comprising adding urea, sulphuric acid, and sulphur trioxide to a solid particulate diluent and agitating the solid particulate diluent during the addition, the rate of addition being such that the reaction mass remains apparently dry and particulate thruout the reaction.

2,408,493
STARTING CONTROL FOR ELECTRIC DISCHARGE DEVICES
Mark A. Townsend, Cleveland Heights, Ohio, assignor to General Electric Company, a corporation of New York
Application December 6, 1941, Serial No. 421,941
11 Claims. (Cl. 315—100)



1. The combination of an electric discharge device having a starting circuit comprising automatic switch means responsive to energization of the circuit for interrupting it to start a discharge in the device, and extraneous shunting means also responsive to energization of the circuit for closing the circuit independently of said switch means and suspending further operation of the latter after repeated operation of the switch means has failed to start the discharge.

2,408,494
EARPHONE SOCKET
Paul S. Veneklasen, Saugus, Mass., assignor to the United States of America, represented by the Executive Secretary of the Office of Scientific Research and Development
Application June 7, 1945, Serial No. 598,168
2 Claims. (Cl. 179—182)

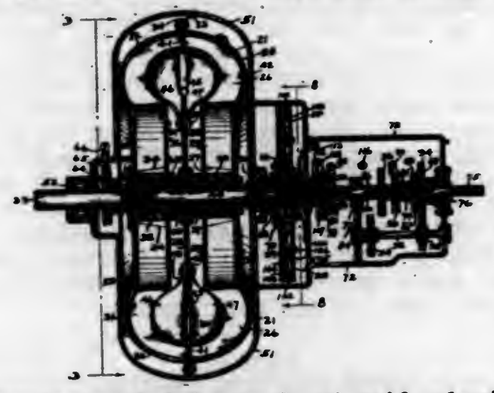


1. An earphone socket comprising an outer sealing section formed with a rolled sealing edge and an inner section for supporting an earphone, said inner section being connected to the outer section by flexible, annular web portions, said inner section further including a sealing rim characterized by an air space, said rim adapted to engage around those portions of an ear adjacent to the concha.

2,408,495
SMOKE INSPECTION DEVICE
Robert Hudson Wager, Maplewood, N. J.
Application June 19, 1945, Serial No. 600,366
3 Claims. (Cl. 88—14)

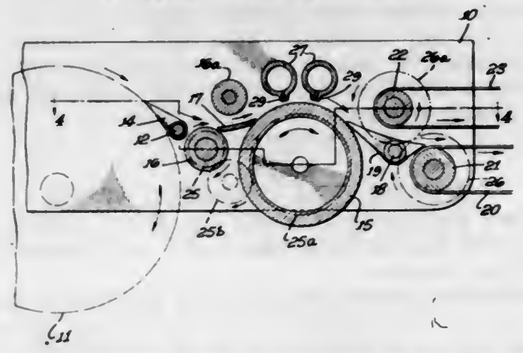
1. In a smoke inspection device, an observation unit comprising a casing having an upwardly open light inlet and a horizontally open light outlet, a plural-plane mirror in said casing for intercepting light rays entering the casing through said inlet and reflecting said rays through said outlet, said mirror comprising a central flat longitudinally inclined reflecting area having right and left longitudinal edges, and two flat longitudinally inclined lateral reflecting areas having inner longitudinal edges extending along said longitudinal edges of said central reflecting area, said two lateral reflecting areas being inclined transversely at an obtuse angle to said central reflecting area, whereby reflected rays will be visible from a central point in front of said light outlet and from points to the right and left of said central point, and means mounting said plural-plane mirror in said casing.

2,408,496
GLASS SURFACING METHOD AND APPARATUS
George B. Watkins, Toledo, Ohio, and Conrad B. Schafer, Charleston, W. Va., assignors to Libbey-Owens-Ford Glass Company, Toledo, Ohio, a corporation of Ohio
Application July 23, 1941, Serial No. 403,634
2 Claims. (Cl. 51—283)



1. The method of forming mirror plates substantially triangular in cross section, comprising supporting a plurality of glass blanks which are substantially rectangular in cross section in a horizontally inclined position, covering said blanks with a bedding material to fill the spaces between adjacent blanks and to provide a flat unbroken surface thereabove, and then simultaneously grinding away the bedding material and the upper inclined surfaces of the glass blanks until said upper surfaces are in a common horizontal plane and at an angle with respect to the bottom surfaces thereof.

2,408,497
POWER COUPLING MEANS
Walter C. Weaner, Muncie, Ind.
Application May 9, 1945, Serial No. 592,904
10 Claims. (Cl. 192—3.2)



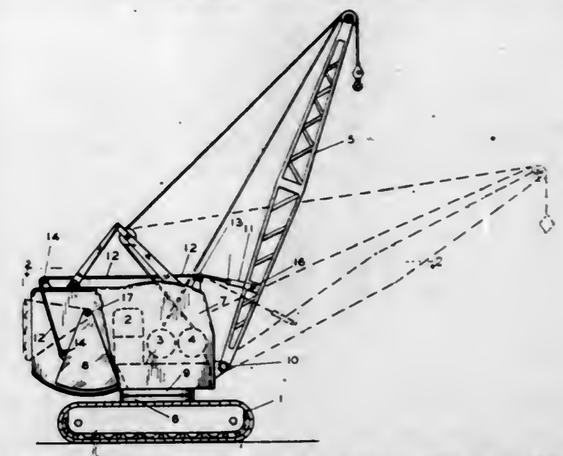
1. A power coupling comprising a driving impeller; a driven turbine wheel; a driven shaft;

mechanical means releasably interconnecting said wheel with said shaft; and stabilizer means yieldingly interconnecting said wheel and said shaft; said mechanical means comprising interlockable

abutments carried by each of said wheel and shaft; and means shiftable longitudinally of said shaft to engage and disengage said abutments; said shiftable means being independent in operation from that of said stabilizer means.

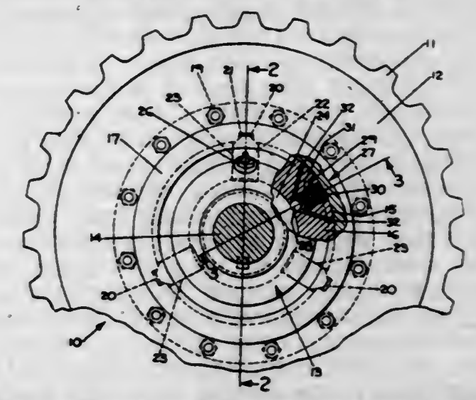
2,408,498
APPARATUS FOR COOLING AND HARDENING WAX CARBON COATINGS
Nelson S. Welk, Athens, Ohio, assignor to The McBee Company, Athens, Ohio, a corporation
Application April 24, 1944, Serial No. 532,524
1 Claim. (Cl. 101—416)

In combination with a printing press for printing wax carbon on sheets of paper, said press including a printing cylinder, a cooling cylinder arranged at a spaced distance from the printing cylinder with its axis parallel thereto and revolving at substantially the same peripheral speed, transfer means between the printing cylinder and the cooling cylinder for transferring the sheets from the printing cylinder over the cooling cylinder, a plurality of nozzles arranged longitudinally over the cooling cylinder to direct air jets towards the upper surface thereof whereby sheets directed to the cooling cylinder will pass between said jets and said cooling cylinder, a conveyer for receiving sheets from the cooling cylinder and discharging them from the machine, and transfer means between said conveyer and said cooling cylinder for stripping the sheets from the cooling cylinder and directing them to the conveyer, and string belts overlying the conveyer with their bottom flights spaced over the conveyer to maintain the sheets flatwise on the conveyer.



2,408,499
PISTON EXPANDER
Frank E. Wells, Alliance, Ohio
Application August 21, 1945, Serial No. 611,750
7 Claims. (Cl. 309—12)

1. A piston expander for adjusting the skirt of a slotted skirt piston comprising a pair of flanged bushings positioned in openings in the said skirt; a threaded bolt slidably positioned through and between the said flanged bushings; a coil spring positioned around the threaded bolt



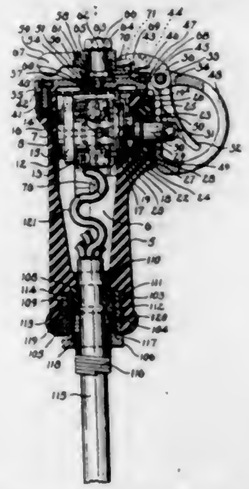
and adjacent to one of the said flanged bushings; a nut threaded on the said threaded bolt and adapted to move the said coil spring against the said flanged bushing so as to suitably expand the skirt of the said piston.

2,408,500
AUTOMATIC COUNTERBALANCE FOR BOOM DERRICKS
Maxwell A. West, Portland, Oreg.
Application September 13, 1944, Serial No. 553,942
5 Claims. (Cl. 212—49)

1. In revoluble derrick machines, a pivoted boom member, means for raising and lowering the boom, a pendulum boom counterbalance weight swingably mounted behind the boom pivot, cable and roller transmissions between said boom and said pendulum weight, said cable operatively connected to the boom near its lower pivoted end so that as the boom lowers and its effective weight increases, the pendulum weight raises and its applied counterbalance effect also increases to substantially counterbalance said boom.

2,408,501
OVERLOAD RELEASE
Fred J. Wright, Upper Arlington, Ohio, assignor, by mesne assignments, to The Jeffrey Manufacturing Company, a corporation of Ohio
Application August 16, 1944, Serial No. 549,767
7 Claims. (Cl. 192—56)

1. An overload release mechanism including a driving member and a driven member mounted



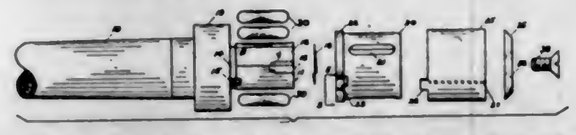
one on the other for relative rotation, overload release mechanism connecting said members, said mechanism including a plunger and a co-operating recess, said plunger working into a chamber filled with grease, a passageway leading from said chamber to contacting surfaces between said driving and driven members, and a relief valve operable under predetermined pressure to provide for flow of grease from said chamber and through said passageway.

2,408,502

WATERPROOF COMBINED ELECTRIC SWITCH AND PISTOL GRIP

Alex A. Writzmann, Wauwatosa, Wis., assignor to Cutler-Hammer, Inc., Milwaukee, Wis., a corporation of Delaware

Application September 21, 1944, Serial No. 555,124
4 Claims. (Cl. 200—157)



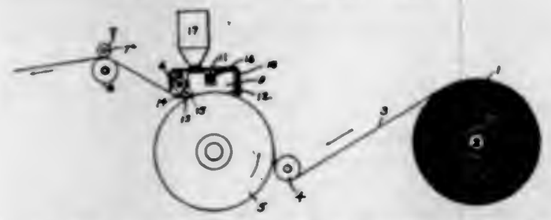
1. In a waterproof combined electric switch and pistol-grip, in combination, a one-piece molded insulating pistol-grip having a passage formed therein by the molding operation and extending from end to end thereof, said passage being of relatively large substantially rectangular contour at one end thereof to bodily receive a switch unit of corresponding form in transverse cross section, said end of said passage being also provided with a plurality of grooves to accommodate the circuit wires associated with said switch, an operating plunger forming a part of said switch and spring biased outwardly with respect thereto, said end of said passage being shaped to require inward compression of said plunger against its bias to provide for insertion of said switch, a side wall of said end of the passage having an opening formed therein to accommodate said plunger in the assembled relation of said parts, a flexible waterproof diaphragm peripherally clamped within said opening and overlying the outer end of said plunger, a metal cover member overlying said end of said passage and attached to said pistol-grip, a rubber-like flexible diaphragm interposed between said cover member and said pistol-grip, a trigger-type lever pivotally attached to said cover member, a second plunger pivotally attached to said lever and alined with said first plunger to effect operation of the latter at will against its bias, the other end of said passage being shaped to slidably accommodate the end portion of a conductor cord having a waterproof covering thereon, said cord including a plurality of individually insulated wires for attachment to the switch terminals, a rubber-like elastic ring positioned within said last mentioned end of said passage, a nut having threaded engagement with said end, said nut being adapted to effect axial compression of said ring to effect water-tight engagement of the inner and outer peripheries thereof with the cord and the pistol-grip respectively and to provide an effective strain relief for said cord, said trigger-type lever having an integral extension formed thereon and adapted to overlie said cover member, a manually operable latch lever also pivotally supported by said cover member, said latch lever in one extreme position thereof being adapted to provide for movement of said trigger-type lever at will to either extreme position, and said latch lever in its other extreme position being adapted to retain said trigger-type lever in the extreme position of the latter corresponding to circuit completing positioning of the switch parts.

2,408,503

PIN CLUTCH ARBOR

Ray Alden Young, Willoughby, Ohio

Application May 24, 1944, Serial No. 537,151
3 Claims. (Cl. 279—2)



1. In a clutch type arbor of the type including a shoulder, a head attached thereto and a cage having a notch therein mounted thereon, a stop means, comprising, a pin mounted on the shoulder adjacent to the head and engageable with the cage in a manner limiting the rotation thereof, and an expansible sleeve mounted on the cage and having a tab thereon engageable with the aforesaid notch adjacent to the said pin.

2,408,504

MEANS FOR COATING WEBS

Samuel Bergstein, Cincinnati, Ohio, assignor to Robert Morris Bergstein and Frank David Bergstein, trustees

Application September 14, 1944, Serial No. 554,022
14 Claims. (Cl. 91—53)

1. In a coating machine, a draw roll, a doctor blade having an operative edge located adjacent but spaced from the surface of said draw roll, means for moving a web under tension around a substantial circumferential portion of said draw roll and thence tangentially to the operating edge of said doctor blade, means for introducing coating material onto said web adjacent said doctor blade so as to cause said material to dam up against said doctor blade, and means for adjusting the amount of coating applied to said web by angular adjustment of said doctor blade with respect to the tangential path of travel of said blade.

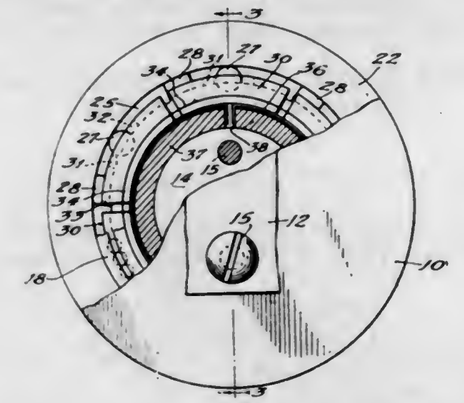
2,408,505

RECEPTACLE FOR FLUIDS

Clarence W. Brandon, Newport, and George M. Brandon, Tallahassee, Fla.

Application March 28, 1945, Serial No. 585,360
16 Claims. (Cl. 114—74)

1. In a tank for the transportation of fluids, the combination of a cylindrical tank body closed at its ends, an arcuate shield secured in fluid tight relationship to the interior of said tank defining a vapor and buoyancy chamber, means



defining a recess in said chamber, valve means for filling said tank in said recess, and a float control for said valve.

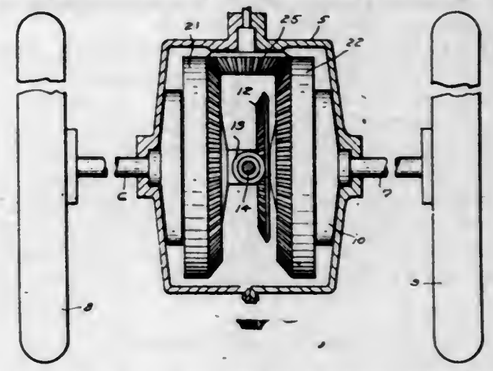
2,408,506

REVERSIBLE CLUTCH

Theodore S. Briskin, Joseph Charles Zivny, Alvin Edward Schellschmidt, and Julian Joseph Golick, Chicago, Ill., assignors to Excel Auto Radiator Company, Chicago, Ill., a corporation of Delaware

Application July 27, 1944, Serial No. 546,818
8 Claims. (Cl. 192—44)

1. A reversible overrunning clutch, comprising an annular rotatable member, an internal ring gear journalled therein, a stationary member on which said annular member is journalled, said ring gear being formed with a peripheral recess which cooperates with the inner surface of said driven member to form a cavity which tapers at both ends, a roller disposed within said cavity and adapted to be wedged at either end of said cavity between the tapering walls thereof, and roller positioning means including a member projecting into said cavity and engaging the roller disposed therein to maintain it at one end of said cavity or the other and having a portion which is maintained in frictional contact with said stationary member whereby the position of said roller in said cavity will be determined by the direction of rotation of said ring gear.



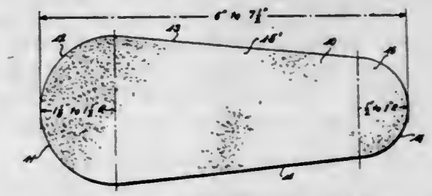
2,408,507

STEERING DRIVE MECHANISM FOR DRIVEN WHEELS

Clifford C. Brown, Clinton, Ohio

Application October 20, 1944, Serial No. 559,542
2 Claims. (Cl. 180—17)

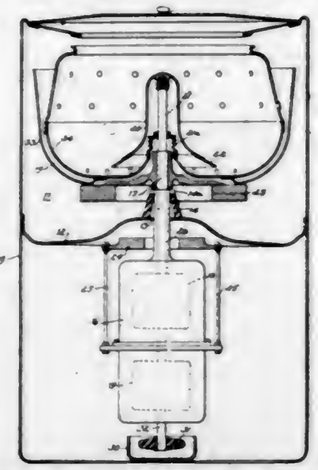
1. A steering drive mechanism for a pair of driven wheels and comprising axles for the wheels, a gear housing rotatably supporting the inner ends of the axles, a head on the inner end of each axle, a shaft journaled in respective heads in alignment with the axles, a driven gear secured to the shaft, planetary gears carried by the heads, gears secured to the shaft engaging said planetary gears, ring gears journaled on the shaft in engagement with the planetary gears, and means controlling the movement of said ring



gears to effect an increase in the speed of one of the axles and a corresponding decrease in the speed of the other axle to produce a lag in the wheel attached to said last-named axle.

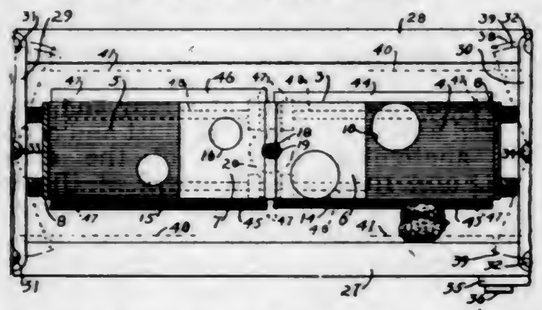
2,408,508

NONCHAFING CATAMENIAL PAD



John P. Canavan, Neenah, Wis.

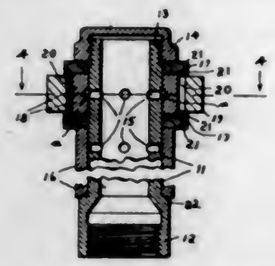
Application December 1, 1942, Serial No. 467,491
3 Claims. (Cl. 128—290)



1. A catamenial device comprising: a pad of predetermined shape including a body of absorbent material of substantially uniform thickness having a narrow rear end region, a relatively wider front end region, and an intermediate region of non-uniform width connecting said front and rear regions and providing converging side edges between said front and rear regions, said intermediate and rear end regions being sized and shaped to fit against and conform to the anatomical contour of the external genitalia and the adjacent parts of the inner thighs of the wearer without any substantial lateral compression of said absorbent pad, the over-all length of said absorbent pad being such as to extend from the anus to a point slightly beyond the mons Veneris; and an open mesh gauze sheet of substantially greater length than said absorbent pad enclosing said pad and providing extensions extending rearwardly and forwardly of the ends of said pad adapted to be secured to a suitable sanitary belt, one thickness of said gauze sheet overlying the upper surface of said absorbent pad, the side edges of said sheet being folded in overlapping relation along the lower surface of said pad to provide more than two thicknesses of fabric, said overlapped portions being of a width approximately equal to the narrow rear end region of said absorbent pad and serving as a band-like support underlying the major portion of the area of said pad to prevent roping and twisting of said pad in use and to further provide a rearward gauze extension which will not rope and produce a cutting effect in the gluteal fold, said pad being adapted to be worn with the narrow rear end region terminating at the anus, whereby the usual bunching and packing rearwardly of the anus is eliminated and the discomfort to the wearer incident thereto is avoided.

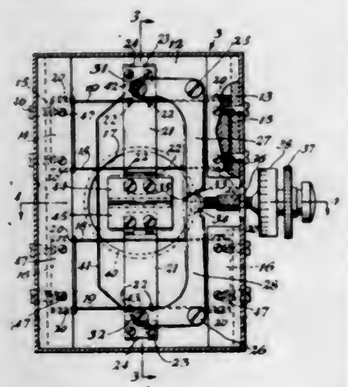
2,408,509
DOMESTIC APPLIANCE
Kendall Clark, Oakwood, Ohio, assignor to General Motors Corporation, Dayton, Ohio, a corporation of Delaware
Application August 14, 1941, Serial No. 406,881
3 Claims. (Cl. 68—23)

1. A machine comprising a frame, a rotatable basket member, an agitator member in said basket member, a power member drivingly connected to said basket member and said agitator member, said members being movably supported on said frame, a non-rotatable vibration damping weight flexibly secured to said power member and being oscillatable with respect to said frame, and a rotatable stabilizing weight carried by said basket.



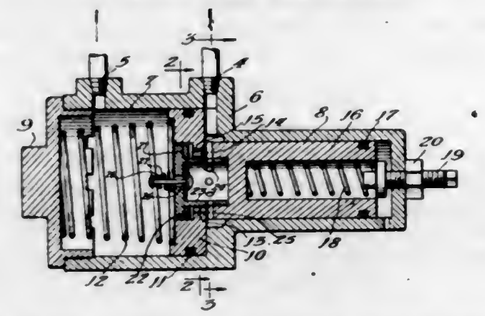
2,408,510
NUT CRACKING MACHINE
Fred F. Feldmann, San Jose, Calif.
Application November 22, 1943, Serial No. 511,370
1 Claim. (Cl. 146—12)

In a machine for cracking nuts the combination of, a fixed horizontal supporting member, plates adjustable for vertical inclination mounted on each side of said member and means for effecting said adjustment, crusher plates disposed in spaced and opposed relation to said first mentioned plates, rocker arms pivotally mounted at their centers on said supporting member and pivotally connected at their ends to said crusher plates to support and actuate the same simultaneously, and means operative to actuate the rocker arms and crusher plates.



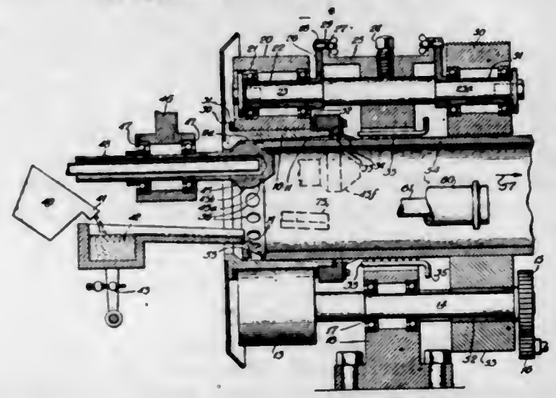
2,408,511
FOG NOZZLE
Thomas J. Gothard, Los Angeles, Calif.
Application October 27, 1943, Serial No. 507,790
6 Claims. (Cl. 299—126)

1. In a fog-nozzle, a tubing with radially extending openings for discharge, a sectioned ring with matching channels in oppositely disposed faces of the sections in form of jets which are in communication with said openings and formed to discharge tangentially from the ring, deflecting rings with vaporizing edges extending beyond the peripheral contours of the first-named ring,



and a rotor on the first-named ring and between the deflecting rings and having actuating means in its inner face in a position to be acted upon by said jets and to discharge towards said vaporizing edges.

2,408,512
DEVICE FOR FORMING SLITS
Albin A. Gradisar, Buffalo, N. Y., assignor, by mesne assignments, to American Optical Company, Southbridge, Mass., a voluntary association
Application December 30, 1942, Serial No. 470,563
10 Claims. (Cl. 88—61)

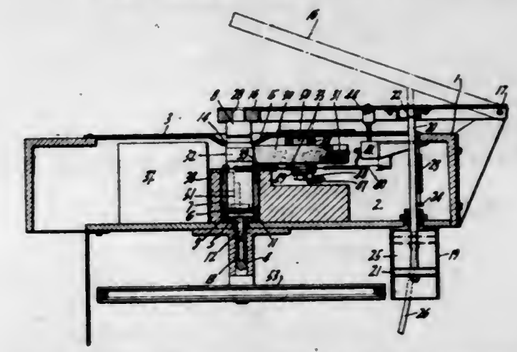


1. A device for forming a slit of precisely adjustable width for admission of a light beam in a spectrometer or like optical system having, in combination, means providing a first slit-defining edge, a jaw member including a jaw providing the second slit-defining edge opposed to said first edge, means mounting said jaw member for adjustment movement in opposite directions normal to said slit toward and away from said first slit-defining edge, said mounting means comprising supports at opposite sides of the path of adjustment of said jaw member and flexible reed means fixed to said member and to said supports and extending transversely of the path of adjustment to float said member between said supports, and adjustment means engaging said jaw member and manipulable in one direction to force said jaw member in one of its said opposite directions of adjustment against the yieldable resistance of said reed means and in the reverse direction to control return movement of said jaw member by the release of tension of said reed means, said reed means being so constructed and arranged as to support said jaw member in a fixed plane, and to be under tension urging said jaw member in one of its said opposite directions of adjustment and into operating contacting engagement with said adjustment means, at all positions of adjustment of said jaw member.

2,408,513
FLUID PRESSURE PRODUCING DEVICE
Ralph R. Gunderson, Chicago, Ill.
Application January 6, 1945, Serial No. 571,582
9 Claims. (Cl. 60—54.6)

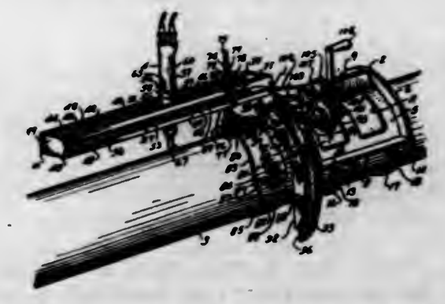
1. A fluid pressure producing device comprising: a cylinder member having a cylinder of large diameter and a cylinder of smaller diameter, a piston in the large cylinder, a valve-head seating in said piston, a fluid port in said large cylinder at one end of the travel of said piston and a second port near the other end of said travel, a plunger in said smaller cylinder connected to said valve head, spring means urging said plunger towards said piston to unseat the valve-head, and a spring in the large cylinder urging the piston towards one end of its travel.

2,408,514
METALWORKING PROCESS AND APPARATUS
Clarence W. Hazelett, Greenwich, Conn.
Application April 10, 1943, Serial No. 482,606
19 Claims. (Cl. 22—57.2)



1. A process for forming tubing directly from molten metal that comprises pouring a ribbon of metal directly on a rotating mold member, effecting the solidifying of said metal on said mold member as said mold member rotates, drawing said metal endwise relatively to said mold member while said metal rotates with said mold member, whereby the said metal is in the form of a helical metal ribbon, determining the rotation and endwise movement of the metal at such a rate relatively to the rate of pouring of the metal that the successive convolutions of the helical ribbon of metal deposited on said mold member are at least juxtaposed, and the last convolution is in such a state that the metal last poured on said mold member may be welded to said last convolution, and applying the pressure of a rolling surface radially of said mold member to weld said metal to the last convolution while also applying the pressure of a tapered rolling surface axially of said mold member against the surplus metal flowing lengthwise and from under said first rolling surface onto the last convolution.

2,408,515
TIN DEPOSITING PROCESS
Arthur G. Hopkins, Maspeth, Long Island, N. Y.
No Drawing. Application May 19, 1942,
Serial No. 443,623
2 Claims. (Cl. 117—22)



1. The method of depositing tin on an iron surface which consists in coating the iron with powdered tin held in a co-polymer of vinyl chloride and vinyl acetate vehicle and in then heating the same to effect the fusion of the tin particles and their adhesion to the iron surface producing a fused continuous deposit of tin on the iron surface, the vinyl resin serving as a vehicle in the coating application and as a flux in the tin fusing step.

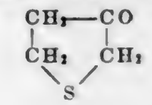
2,408,516
MARKING MACHINE
Erwin C. Horton, Hamburg, N. Y., assignor to Trico Products Corporation, Buffalo, N. Y.
Application November 28, 1942, Serial No. 467,235
13 Claims. (Cl. 101—7)

6. An identification machine comprising a wheel bearing a peripheral marking device, a rotary holder arranged to engage a work piece at one end and to support the side of the work piece adjacent the periphery of the wheel, means for rotating the holder, a movable journal support for the wheel by which its periphery may be brought into contact with the revolving work piece to be driven thereby for rolling the marking device thereon, movable centering means for engaging the opposite end of the work piece to give support thereto and position the same for the rolling action, and means operable by the centering means for so moving the journal support.

2,408,517
PIPE-CUTTING APPARATUS
Posy A. Howard, Tulsa, Okla., assignor of one-half to C. A. Mathey and one-half to C. B. Harter, Tulsa, Okla.
Application September 4, 1943, Serial No. 501,271
2 Claims. (Cl. 33—21)

1. In a pipe cutting apparatus, segmental ring and track members having ends spaced apart to pass the members over a pipe to be cut, a saddle

supporting the track member, means on the saddle having engagement with the pipe for positioning the axis of the track member concentric with the axis of the pipe, clamping means for securing the saddle to the pipe, a pair of driving members supported in fixed relation to the saddle and having driving contact with the segmental ring for moving the ring member on the track member, means on the ring member for mounting an instrument for movement longitudinally of the pipe, a templet about the pipe adapted to fit against one side of said segmental track and provided with a guiding edge, a templet follower operatively engaged with the instrument and movable toward the pipe, a flange on the follower for engagement with the templet for limiting movement of said follower toward the pipe, and means for resiliently urging said templet follower to engage with the templet for controlling the cut of the pipe in accordance with the shape of the templet.



2,408,518

THIOPHAN-3-ONE AND PROCESS FOR THE MANUFACTURE OF SAME

Paul Karrer, Zurich, Switzerland, assignor to Hoffmann-La Roche Inc., Nutley, N. J., a corporation of New Jersey

No Drawing. Application March 22, 1943, Serial No. 480,090. In Switzerland April 16, 1942
2 Claims. (Cl. 260—329)

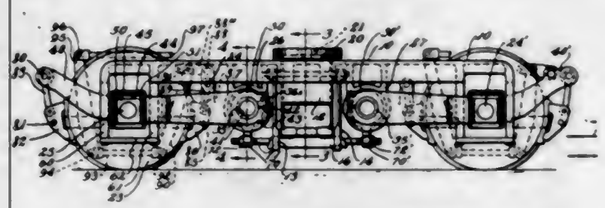
2. Thiophan-3-one of the formula

2,408,519

MANUFACTURE OF 4-KETO-TETRAHYDROTHIOPHENES

Anthony William d'Aubigny Avison, Franz Bergel, and John Wynne Haworth, Welwyn Garden City, England, assignors to Roche Products Limited, Welwyn Garden City, England

No Drawing. Application July 7, 1944, Serial No. 543,768. In Great Britain July 6, 1943
3 Claims. (Cl. 260—329)



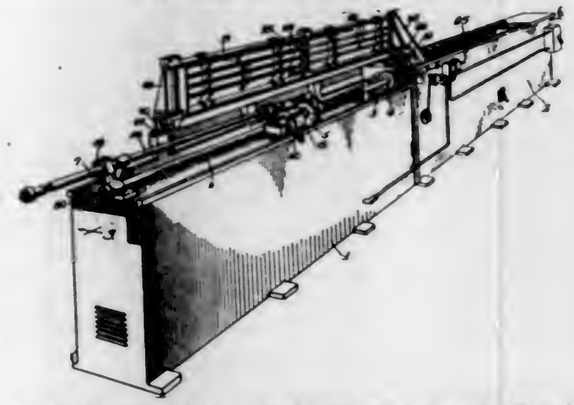
3. 4-keto - tetrahydrothiophenes carrying substituents in the 2-position selected from the group consisting of alkyl, substituted-alkyl, aryl, fatty acid and fatty acid ester groups.

2,408,520

TRUCK FOR RAIL VEHICLES

Alvin S. Krotz, Akron, Ohio, assignor to The B. F. Goodrich Company, New York, N. Y., a corporation of New York

Application June 29, 1943, Serial No. 492,687
9 Claims. (Cl. 105—190)



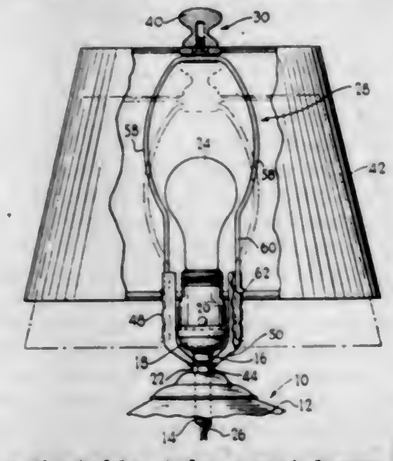
1. A truck for a rail vehicle comprising a bolster for supporting the body of a vehicle, a frame structure from which said bolster is suspended, a tubular housing adjustably fixed to said frame structure and extending laterally of the truck from side to side thereof to constitute a frame member, a shaft extending axially within said housing, a resilient torsion bushing between said housing and said shaft, said bushing being fixed to said housing and said shaft for torsional flexing, a rail wheel, and an arm adjustably fixed to said shaft and having a journal box for engaging the axle of said wheel.

2,408,521

BROACHING MACHINE

Francis J. Lapointe, Ann Arbor, Mich., assignor to American Broach & Machine Co., Ann Arbor, Mich., a corporation of Michigan

Application February 10, 1942, Serial No. 430,235
16 Claims. (Cl. 90—33)



1. In a broaching machine, a horizontally elongated frame, a pull head mounted for horizontal reciprocation thereon, a broach connected to the pull head, work supporting means for a work piece having a bore to be broached, a tube for coolant, closed at one end, alignable with the bore of the work piece and provided with means at its other end to form a disengageable sealed connection with said bore, said tube being dimensioned to enclose the broach when the latter is positioned at the beginning of its working stroke, and supporting means for said tube on which said tube is movable out of connection with said bore into a position exposing the open end of the tube for entry of the broach therein.

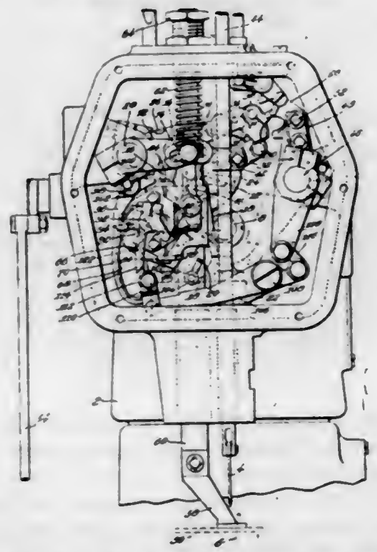
2,408,522

LAMP HARP

David Leef, Bronx, N. Y.

Application March 24, 1945, Serial No. 584,713
2 Claims. (Cl. 240—148)

1. An adjustable, take-apart lamp harp comprising a socket-carried attaching bracket including two upwardly extending straight arms of U-shaped cross-sectional configuration whose



open sides face toward the center of the bracket, the closed sides of the arms each having a series of vertically spaced apertures therein, each of the apertures in one of said arms being horizontally registered with an aperture in the other arm, and a resilient shade-carrying bail comprising, a top from which a pair of spaced straight legs depend, said legs each terminating in outwardly extending aligned projections normally spaced apart a distance greater than the distance between the closed sides of the arms of the bracket, said projections being freely receivable in any pair of horizontally registered apertures and each leg at such time having substantially diametrically opposite portions along its length bearing against said arms whereby said bail will firmly be held erect in any adjusted position thereof.

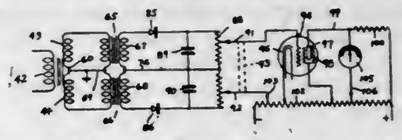
2,408,523

PRESSER FOOT MECHANISM FOR SEWING MACHINES

Bernard T. Leveque, Wenham, Mass., assignor to United Shoe Machinery Corporation, Flemington, N. J., a corporation of New Jersey

Original application June 23, 1943, Serial No. 491,863. Divided and this application July 27, 1945, Serial No. 607,292
8 Claims. (Cl. 112—61)

1. A sewing machine having, in combination, stitch forming devices, a work support, a presser foot, a sliding spring-pressed presser foot bar for urging the presser foot yieldingly against the work on the work support, and means for actuating the presser foot positively toward and from the work during each sewing cycle, comprising a lock supporting block slidingly mounted on the presser foot bar, mechanism acting in two directions to move the block, and a two-way clutch for locking the block to the presser foot bar.



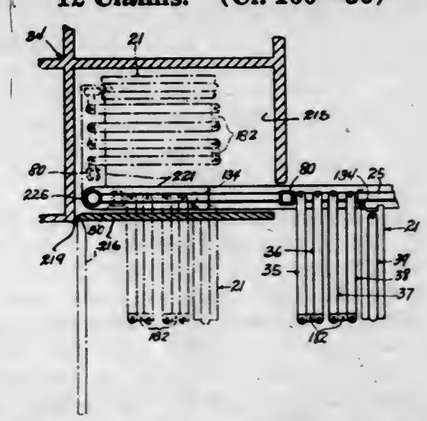
2,408,524

ELECTRIC GAUGE

Ricardo Mestas, Los Angeles, Calif., assignor to Kobe, Inc., Huntington Park, Calif., a corporation of California

Application August 3, 1940, Serial No. 350,939
20 Claims. (Cl. 177—351)

1. In an electrical measuring device, the combination of: means providing two flux paths; an element movable in one direction to increase the reluctance of one flux path while relatedly decreasing the reluctance of the other flux path and movable in a different direction to decrease the reluctance of said one flux path while relatedly increasing the reluctance of the other flux path; two windings respectively linked with said flux paths and each providing two terminals, one terminal of one of said windings being electrically common with respect to one terminal of the other of said windings to maintain these two terminals at the same potential; means for energizing said windings from a source of alternating potential to produce a potential difference across each of said windings whereby the ratio of said potentials across said windings changes with movement of said element; two rectifier means respec-



tively connected to the remaining end terminals of said windings to pass current in the same direction with respect to the remaining end terminals of said windings; and a center-tapped output impedance means and means for connecting same across the output of said two rectifier means and for connecting the center tap to said electrically common terminals of said windings, said output impedance means including a bi-directional meter responsive to changes in direction and magnitude of the potential across the output of said two rectifier means to indicate the direction and magnitude of movement of said element.

2,408,525

FOLDING DOOR

Robert A. Miller, Tarentum, and Carroll Howard, Rochester, Pa., assignors to Pittsburgh Plate Glass Company, a corporation of Pennsylvania

Application July 13, 1944, Serial No. 544,800
12 Claims. (Cl. 160—36)

1. A folding door structure comprising a plurality of upright doors, track means having connections with the doors for guiding them horizontally while maintaining said doors in an upright position, hinges connecting adjacent doors and carrying them for folding movements on vertical axes, one of said doors having an additional pivotal support movable with the door structure along the track means and supporting said door for opening and closing action independently of said hinges.

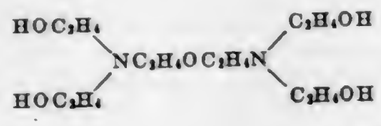
2,408,526

GLASS SUPPORTING SKELETON MOLD

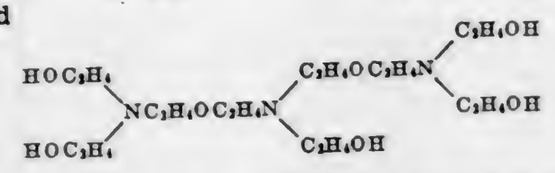
Gerald Z. Minton, Tarentum, Pa., assignor to Pittsburgh Plate Glass Company, Allegheny County, Pa., a corporation of Pennsylvania

Application January 10, 1944, Serial No. 517,665
9 Claims. (Cl. 49—67)

1. In an openwork structure for supporting a sheet of glass incidental to heat treatment there-



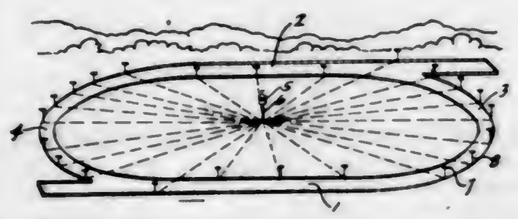
of, a polygonal frame normally disposed in a horizontal position, and a plurality of upright wires secured upon the sides and ends of the frame in spaced relation to one another, said wires having spaced upper angular extensions



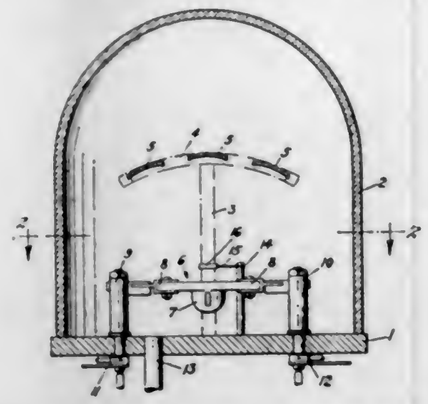
defining as a group a curved contour corresponding substantially to the marginal shape of the sheet of glass and adapted to support a sheet of glass conforming to the curvature defined by said extensions.

2,408,527
PROCESSES FOR REDUCING OR PREVENTING FOAM
Louis T. Monson, Alhambra, Calif., assignor to Petrolite Corporation, Ltd., Wilmington, Del., a corporation of Delaware
No Drawing. Application January 1, 1944, Serial No. 516,707
7 Claims. (Cl. 252—321)

1. A process for destroying or reducing foam, characterized by subjecting a foaming composition to the action of a reagent comprising a basic acylated polyaminoalcohol; said acylated polyaminoalcohol being a member of the class consisting of



and

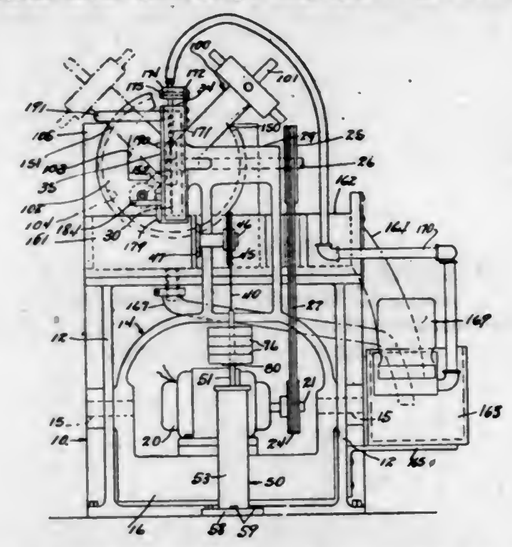


in which one hydroxyl hydrogen atom has been replaced by RCO, the acyl radical of a monocarboxy detergent-forming acid having at least 8 and not more than 32 carbon atoms; said amino compound being selected from the class consisting of the anhydro base, the hydrated base, and salts; said amino compound being selected from the class consisting of the anhydro base, the hydrated base, and salts.

2,408,528
RACE RECORDING SYSTEM
Edward Nassour, Los Angeles, Calif.
Application January 16, 1945, Serial No. 572,989
4 Claims. (Cl. 88—16)

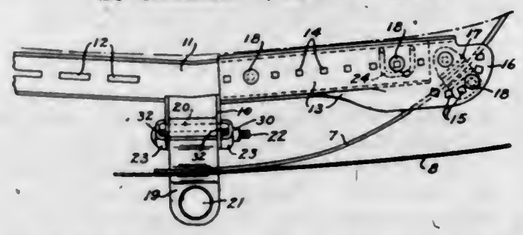
1. In an apparatus for recording a race around a closed track, the combination of: a series of motion picture cameras arranged in spaced relation to each other around said track, each of said cameras being positioned with its optical axis extending lengthwise of the track segment to which it is adjacent to dispose such track segment in the field of view of the camera, control means for each of the cameras to control the starting and stopping of photographing the respective track segments by respective cameras, a sighting device, means mounting said sighting device for movement by an observer to maintain the field of vision of said sighting device upon a race as the race progresses about said track, and means actuated by movement of said sighting device for actuating the control means for each camera successively as a race progresses into the field of view of the respective camera adjacent the segment then within the field of vision of said sighting device.

2,408,529
APPARATUS FOR TREATING ARTICLES
Harold Osterberg, Gilbert E. Pride, and Paul C. Heijn, Buffalo, N. Y., assignors, by mesne assignments, to American Optical Company, Southbridge, Mass., a voluntary association
Application August 17, 1943, Serial No. 498,972
5 Claims. (Cl. 91—12.2)



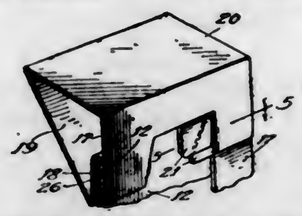
1. Apparatus for coating a workpiece by vacuum distillation comprising means providing a vacuum chamber, means for supporting the workpiece within said chamber, means for vaporizing the coating material, said last mentioned means directing the vaporized material along a widening path toward the workpiece, and an annular vignetting member positioned in said path to alter the distribution of the vaporized material received by said workpiece by the shadow cast by said member, said shadow on said workpiece being partial centrally of said path and changing in intensity toward the outer portions thereof.

2,408,530
APPARATUS FOR CUTTING PRISMS
William Owen, Pittsburgh, and Ivan G. Peck, Ford City, Pa., assignors to Pittsburgh Plate Glass Company, a corporation of Pennsylvania
Application April 11, 1944, Serial No. 530,576
12 Claims. (Cl. 125—14)



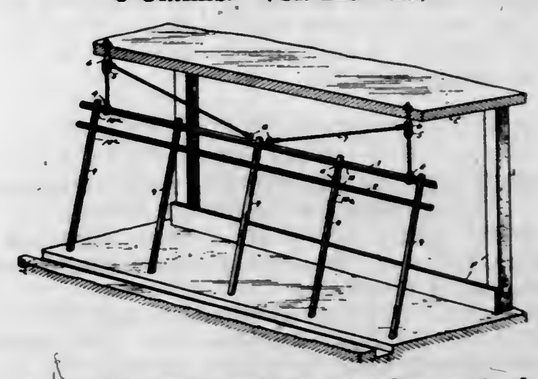
1. A glass sewing apparatus comprising a pair of disk cutters disposed in substantially the same plane, means supporting said cutters for movement toward and away from each other in said plane, a support for positioning a glass slab between said cutters, means connected to the cutters and urging them toward each other against opposite portions of the glass slab, stops on the cutter supporting means to limit movement of the cutters toward each other and permitting

concurrent movement of the cutters in the same direction after said stops engage each other, and



power means connected to the cutters for rotatably driving them.

2,408,531
TRAILER HITCH
Howard C. Riemann, West Milwaukee, and Joel R. Thorp, West Allis, Wis., assignors to The Fulton Company, West Allis, Wis., a corporation of Wisconsin
Application December 18, 1944, Serial No. 568,576
13 Claims. (Cl. 280—33.44)



1. In a trailer hitch, a bracket having fixed laterally spaced side walls and rigid arms extending outwardly away from said walls, a coupling member swingably suspended from said bracket between said walls, supporting members for said bracket secured to said arms and being independently slidably adjustable therealong, and a clamp swingably adjustable about a vertical pivot relative to the outer end portion of each of said supporting members.

2,408,532
COLLAPSIBLE FRAMED DISPLAY
Earl M. Roach, Chicago, Ill., assignor to Arvey Corporation, Chicago, Ill., a corporation of Illinois
Application May 10, 1944, Serial No. 534,963
2 Claims. (Cl. 40—155)

1. In a collapsible display formed of a single sheet of foldable material to receive a picture sheet, a rectangular blank of cardboard having cut-away corners and score lines extending parallel to each of the sides thereof to provide a central panel and side panels, each of said side panels having a first section foldable so as to overlie a marginal edge of the face of the central panel and form a recess for receiving a side edge of a picture sheet therein, a second section inclined outwardly from said first section, a third section extending rearwardly to terminate adjacent the plane of said central panel, and a fourth section extending inwardly for engagement aaginst the back side of said central panel, said second sections having interlocking tabs and slots formed at the ends thereof to interlock said second sections together for maintaining said first sections against the face of said central panel, and hook tabs provided on said fourth sections for locking said fourth sections together against the back side of said central panel.

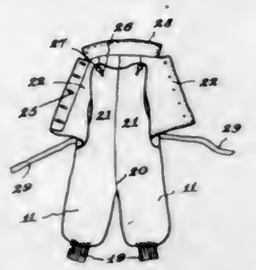
2,408,533
CATTLE STALL PARTITION APPLIANCE
Louis C. Russell, McGraw, N. Y.
Application June 9, 1944, Serial No. 539,547
5 Claims. (Cl. 119—15)

1. A cattle stall partition appliance including a horizontal overhead bar common to a plurality of stalls, means for flexibly suspending the bar from the ceiling to swing forward and rearward, and upright partition bars suspended from the horizontal bar to swing with the overhead bar forward and rearward and extending to the floor, all whereby the partition bars are shiftable into and out of operative partition forming position.

2,408,534
LUBRICATING SYSTEM FOR ROCK DRILLS
Otto J. Schorer, Holyoke, Mass., assignor to Worthington Pump and Machinery Corporation, Harrison, N. J., a corporation of Delaware
Application July 31, 1945, Serial No. 607,941
3 Claims. (Cl. 184—55)

1. In a lubricating device for rock drill the combination of a cylinder, a piston reciprocable therein and having a head, a valve chamber in the rear end of said cylinder, a front head for the cylinder, said cylinder provided with ports and passages for the distribution of pressure air, said cylinder provided with an oil chamber, said front head having an oil chamber therein, a passage in the cylinder establishing communication between the oil chamber in the cylinder and the oil chamber in said front head, said front head having a passageway cut therein opening from

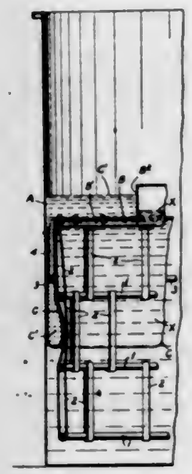
its contained oil chamber into the cylinder in front of the forward end of the piston head, and said cylinder having a passageway therein establishing communication between the cylinder contained oil chamber and one of said cylinder contained pressure air passageways.



2,408,535
THROMBOPLASTIN PRODUCT AND PROCESS FOR PREPARATION OF SAME
Harry P. Smith, Iowa City, Iowa, assignor to Parke, Davis & Company, Detroit, Mich., a corporation of Michigan
No Drawing. Original application April 29, 1940, Serial No. 332,397. Divided and this application June 22, 1942, Serial No. 448,033
5 Claims. (Cl. 167—74)

4. Process for the preparation of antithrombin-free thromboplastin completely soluble in saline which comprises first removing part of the impurities from an extract containing thromboplastin with magnesium hydroxide, adding a protein-precipitating salt, separating and redissolving the precipitate in physiological saline solution and removing said protein-precipitating salt by dialysis of said solution against a physiological saline solution.

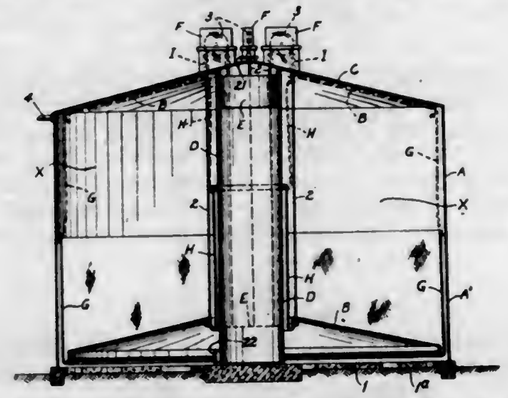
2,408,536
PROTHROMBIN PRODUCT AND PROCESS FOR PREPARATION OF SAME
Harry P. Smith, Iowa City, Iowa, assignor to Parke, Davis & Company, Detroit, Mich., a corporation of Michigan
No Drawing. Original application April 29, 1940, Serial No. 332,397. Divided and this application June 22, 1942, Serial No. 448,034
7 Claims. (Cl. 167—74)



1. Process for the preparation of antithrombin-free prothrombin from a plasma product containing prothrombin and antithrombin which comprises removing by isoelectric precipitation sufficient antithrombins from the plasma product to enable magnesium hydroxide to preferentially adsorb prothrombin from antithrombin and thereafter adsorbing and separating the prothrombin away from antithrombin.

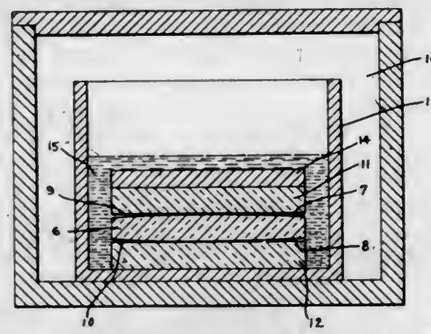
2,408,537
ONE-PIECE GARMENT
Joseph Weingarten, Bronx, N. Y.
Application April 29, 1944, Serial No. 533,299
2 Claims. (Cl. 2—80)

1. A one-piece garment comprising a lower section including leg members, a tongue foldably connected with said lower section at the front thereof dimensioned and foldable in upright relation to said lower section to cover the upper body and chest of the wearer, an upper section connected with said lower section and including a back and sleeve members, co-operating coat-members foldably associated with said upper section and extending below the waist line at the front of the garment in detached relation thereto, said coat-members being foldable over said upright tongue in external relation thereto to simulate a coat, co-operating means on said upper section and said tongue for detachably securing the latter in its upright position, and means for securing said coat-members in detachable connection with each other externally over said tongue.



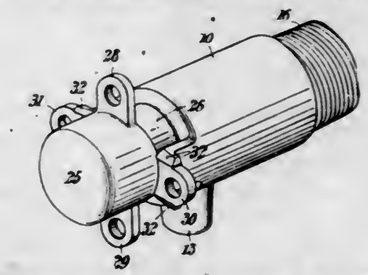
2,408,538
LIQUID STORAGE APPARATUS
John H. Wiggins, Chicago, Ill.
Application December 24, 1943, Serial No. 515,618
4 Claims. (Cl. 220—26)

1. In a liquid storage apparatus, the combination of a container for holding the liquid being stored, a floating roof sustained by the stored liquid, an annular, flexible, liquid-impervious sealing element attached to the peripheral edge of the roof and to the side wall of the container substantially midway of its height so that in the extreme high and low positions of the roof said element will be distended or stretched in substantially parallel relation to the side wall of the container and in an intermediate position of the roof said element will form a downwardly hanging loop which is open at its upper end, a body of mobile liquid that is adapted to flow into and out of the loop of said sealing element and into and out of the space between said element and the side wall of the container during the rise and fall of the roof, and a trough that is adapted to hold said mobile liquid, the bottom and one side wall of said trough being formed by portions of the roof and the opposed side wall of said trough being formed by the flexible sealing element when the roof is at or near its extreme low position and by the side wall portion of the container when the roof is at or near its extreme high position.



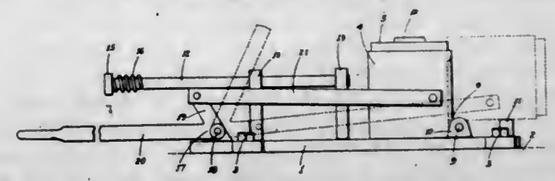
2,408,539
FLUID STORAGE APPARATUS
John H. Wiggins, Chicago, Ill.
Application January 27, 1944, Serial No. 519,957
12 Claims. (Cl. 48—178)

1. In a fluid storage apparatus, the combination of a countainer provided with a roof that constitutes the top wall of the storage chamber of the apparatus, a vertically-movable member in said container which forms the bottom wall of the storage chamber and which is adapted to move upwardly into approximately nested relationship or touching contact with said roof at the end of the upward stroke of said vertically-movable member, a counter-weighting mechanism for said vertically-movable member including a weight, a cable or the like attached to the weight and to said vertically-movable member and extending upwardly from said member through an opening in the roof, a pulley over



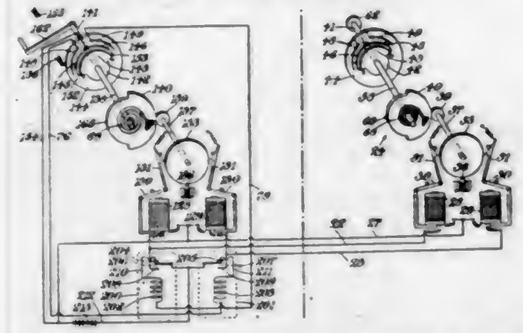
which said cable travels, a vertically-disposed, tubular member projecting upwardly through the container and attached to the roof so as to constitute a support for the roof, the weight of said counterweighting mechanism being housed by said tubular member, and a housing for the pulley arranged outside of the storage chamber above and on the top side of the roof of the container.

2,408,540
METHOD OF FORMING SCRATCH-RESISTANT ARTICLES
William Ewart Williams, New York, N. Y.
Application January 12, 1942, Serial No. 426,478
3 Claims. (Cl. 18—47.5)



1. The method of forming an article of the character described and of simultaneously producing an inorganic outer layer on said article more resistant to scratching than the material of said article comprising forming a bath containing a compound selected from a group consisting of aluminum ethoxide, ethyl silicate, magnesium methoxide and magnesium ethoxide dissolved in a liquid selected from the group consisting of xylol, methyl alcohol, and anhydrous ethyl acohol, placing a blank of organic synthetic resin of a type capable of being superficially softened by the bath and having water therein of an amount sufficient to react with the compound in the bath between forming dies having finished optical surfaces thereon of the contour desired to be formed on the article, placing the assembly in the bath, exerting a pressure on one of said dies in the direction of the other of said dies, subjecting said assembly in said bath to a controlled temperature of an amount and for a time interval sufficient to cause the compound in the bath to react with the water in the material of the blank to form a layer of the reaction product on said blank and for the bath to slightly soften the outer surfaces of the blank and, under the pressure of the dies thereon, cause said surfaces to assume the approximate shape of the contiguous surfaces of the dies, removing said assembly from the bath and subjecting said assembly to a drying atmosphere of a controlled temperature and for a time interval sufficient to properly set the surfaces to the shape of the dies.

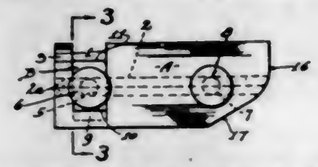
2,408,541
FAUCET
Ronald M. Wilson, Devon, Pa., assignor, by mesne assignments, to William M. Wilson's Sons, Inc., Lansdale, Pa., a corporation of Pennsylvania
Application March 9, 1944, Serial No. 525,654
10 Claims. (Cl. 251—163)



1. In a faucet of the character described, an axially-straight hollow body closed at one end and open at the other, and having a lateral outlet and an ear adjacent its closed end; a closure member with a resilient portion adapted to close against a seat to normally prevent flow through the body; spring means to normally maintain the closure member in engagement with its seat; a stem extending from the closure member through the closed end of the body and axially movable against the spring pressure to open the valve; and a rotatable keeper element at the outer end of the stem having an ear which, upon partial rotation of said element from a normal inactive position is brought into registry with the ear on the body to permit application of a padlock or the like.

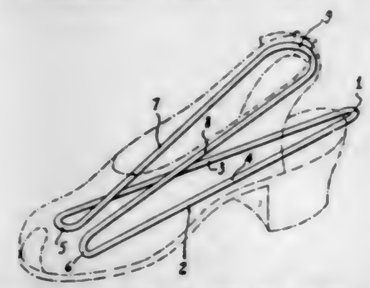
2,408,542
FORGING DIE AND MOUNT ASSEMBLY
Floyd H. Wyman and Joseph M. Malik, Toccoa, Ga., assignors to R. G. Le Tourneau, Inc., Stockton, Calif., a corporation of California
Application November 17, 1942, Serial No. 465,860
5 Claims. (Cl. 78—96)

3. A forging die and mount assembly comprising a base, a normally upstanding, upwardly opening cavity die on the base, means pivoting the die for tip-over movement in one direction to a laterally opening position, said die having a bottom opening, a forging drive out rod, an upstanding guide member slidably mounting said rod above the base in axial alinement with the bottom opening in the die when the latter is in said laterally opening position, said rod being normally clear of the die but axially movable through said opening, an enlarged head on the end of the rod opposite the die, and a compression spring on the rod between the head and guide member.



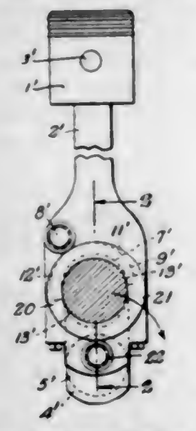
2,408,543
ELECTRICALLY OPERATED DISTANT-CONTROL DEVICE
Alfred Arnot, Warrington, England, assignor to Aeronautical & Mechanical Investments Limited, a British company
Application December 16, 1942, Serial No. 469,270
In Great Britain September 22, 1941
1 Claim. (Cl. 172—239)

Electrically-operated distant-control apparatus having in combination, in a transmitter, a movable control member, a follower therefor, a cam and cam-engaging member carried one by the control member and the other by the follower, the cam having a contact-operating portion which when the follower is in synchronism with the control member is in close proximity to the cam-engaging member, idle sections of the cam adjoining said contact-operating portion, two pairs of make-and-break contacts operated by the cam-engaging member so that one pair of contacts is altered when the control member moves relatively to its follower from a position of synchronism therewith in one direction and the other pair when it moves in the other direction, two ratchet-operating repeating-relays the energizing circuits of which are controlled one by one of the said pairs of contacts and the other by the other pair, line contacts repeatedly actuated by the relays when energized for making and breaking line circuits and thereby sending out repeated line signals, electromagnetically operated ratchet mechanism at the transmitter energized by said line signals and operatively connected to the follower to move it after the control member, at least one of the ratchet mechanisms comprising oppositely-handed ratchet teeth on a single shaft engaged by pawls, one pawl for moving the shaft in one direction and the other pawl for moving the shaft in the other direction and wherein the shaft is connected to the means for operating the contacts through a reduction gear so that the number of steps executed by the ratchet-operating relays in bringing the follower to its desired position is increased, said reduction gear comprising a gap for the purpose of automatically synchronizing the transmitter and receiver at the extreme of movement of the parts in one direction or the other, and, in a receiver, similar magnetically operated ratchet mechanism operated in step with that of the transmitter by the same line signals to actuate a part to be controlled.



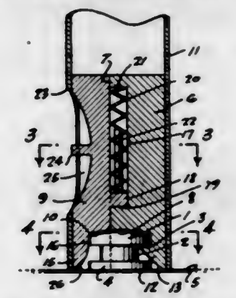
2,408,544
TWIST DRILL SHARPENER
Joseph Banner, Los Angeles, Calif.
Application January 1, 1945, Serial No. 570,933
5 Claims. (Cl. 51—219)

1. A drill sharpening fixture comprising: a body formed with a transverse recess and a longitudinal hole extended entirely therethrough and open at opposite ends of the body, a clamping member mounted in the recess of the body and rotatable on the body to an extent of one hundred eighty degrees in a transverse plane and also having a hole therethrough in registration with the hole in the body for receiving and supporting a drill in sharpening position, said clamp-



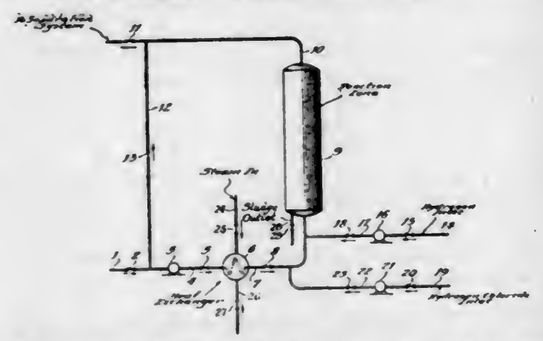
ing member being rotatable on the body about the axis of and with the supported drill, and separate means for locking the clamping member on the drill and the drill on the body so that when a cutting lip of the drill is positioned relative to a surface of said body the drill may be held in a fixed position during a sharpening operation.

2,408,545
SHOE TREE
Katherine Barber, West Los Angeles, Calif.
Application November 26, 1945, Serial No. 630,794
7 Claims. (Cl. 12—128.2)



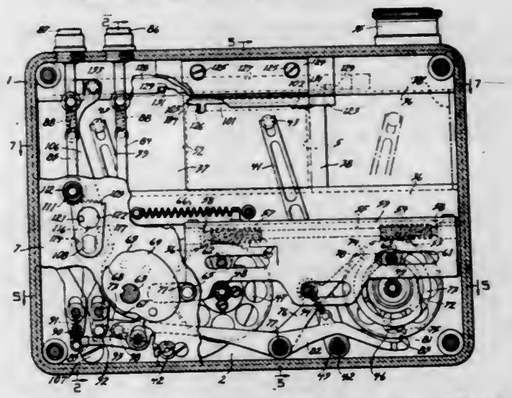
1. In a shoe tree, the combination of: a sole-engaging member comprising a pair of arms disposed to define a V-shape; a vamp-engaging member comprising a pair of arms disposed to define another V-shape, the apex of said latter V-shape being disposed between the arms of said first-named V-shape, and the planes of said V-shapes being disposed at an acute angle relative to each other; a toe-engaging member comprising curved portions joining the apex of said latter V-shape with the upper ends of the arms of said first-named V-shape; and a heel strap engaging member comprising a semi-circular portion joining the upper ends of the arms of said latter V-shape.

2,408,546
MECHANICAL MOVEMENT
Joseph D. Bell, San Francisco, Calif.
Application April 26, 1943, Serial No. 484,646
6 Claims. (Cl. 74—44)



1. In a power transmitting device, a rotary member having a crank therein, a reciprocating member having a connecting rod pivoted thereto, cooperative wedge members on the crank and the rod for transmitting motion from the rod to the crank, and cooperative members on the rod and the crank for controlling lengthwise movement with respect to the cam.

2,408,547
COUPLING
Frederick E. Bertschinger, Los Angeles, Calif., assignor to Standard Cabinet Works, Inc., Los Angeles, Calif., a corporation of California
Application August 18, 1944, Serial No. 549,979
10 Claims. (Cl. 287—20)

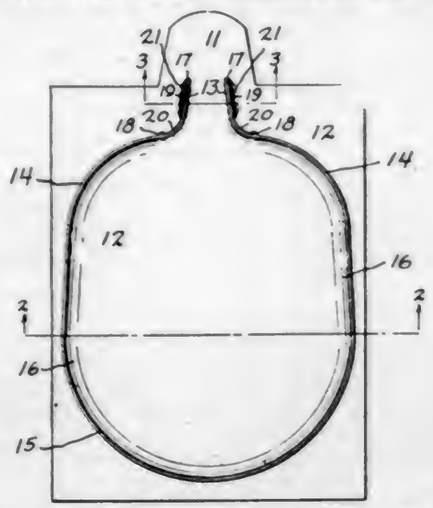


1. In a device of the character described: a first coupling element having a head forming an abrupt shoulder beneath the head; and a second coupling element having a pair of relatively movable parts that together define a recess for the head; one of said parts having a projection extending beneath the head; the other part being movable in a direction longitudinally of the coupling and having a longitudinally sloping surface engageable with said head, said second coupling element also having a resilient device for urging the other part into co-operative locking relation with the said one of said parts, said sloping surface by engagement with said head, serving upon movement of said other part to locking relation, to urge said head into position on said projection.

2,408,548
ISOMERIZATION OF NORMALLY LIQUID HYDROCARBONS
Herman S. Bloch, Riverside, Ill., assignor to Universal Oil Products Company, Chicago, Ill., a corporation of Delaware
Application December 10, 1942, Serial No. 468,496
6 Claims. (Cl. 260—683.5)

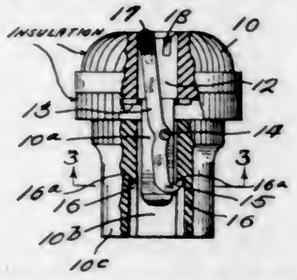
1. A process for the isomerization of a saturated hydorcarbon charging stock which comprises commingling with said charging stock a recycle stock formed as hereinafter set forth, passing the resultant combined feed at isomerizing temperature through a reaction zone containing a catalyst bed comprising a Friedel-Crafts metal halide isomerizing catalyst and therein effecting substantial isomerization of the charging stock, removing the resultant products from said zone and separating the same into portions of like composition, withdrawing one of said portions from the process, commingling another of said portions with the saturated hydrocarbon charging stock as said recycle stock, the amount of charging stock in the resultant combined feed being substantially equivalent to the amount of said portion of the products withdrawn from the process, and regulating the amount of said other portion of the products in the combined feed to provide in the reaction zone a linear velocity for the combined feed of at least 20 centimeters per hour, a residence time not in excess of about 15 hours and a space velocity not below about 0.4 measured as volumes of combined feed per volume of catalyst bed per hour.

2,408,549
PHOTOGRAPHIC CAMERA
George A. Brueske, Wayzata, Minn., assignor to The Bell & Howell Company, Chicago, Ill., a corporation of Illinois
Application January 6, 1943, Serial No. 471,411
12 Claims. (Cl. 95—55)



1. In a device of the character described, the combination with an exposure shutter including a revoluble element operative with continued rotation thereof to effect successive exposure cycles of the shutter, of a revoluble abutment stop element operatively connected with said revoluble shutter element to rotate in timed relation therewith, a second abutment stop element positionable in and out of abutting relation with said revoluble stop element and operative to stop the shutter in closed position, a third abutment stop element positionable in and out of abutting relation with said revoluble stop element and operative to stop the shutter in closed position in advance of stoppage of the shutter by said second stop element, means yieldably urging said second and third stop elements respectively into and out of said abutting relation, two control means respectively operative on said second and third stop elements for actuating the same respectively out of and into said abutting relation, and a one-way connection operative between said second and third stop elements to position said second stop element out of said abutting relation upon positioning of said third stop element in said abutting relation and to permit positioning of said second stop element out of said abutting relation while said third stop element is out of said abutting relation.

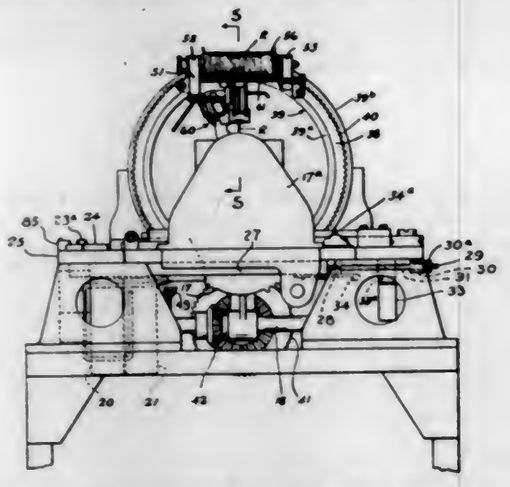
2,408,550
BED SERVICE SET
Theodore D. Crane, Council Bluffs, Iowa
Application May 19, 1943, Serial No. 487,572
3 Claims. (Cl. 4—112)



1. A bed service set comprising a flat thin base member, an excretion receiving member adapted

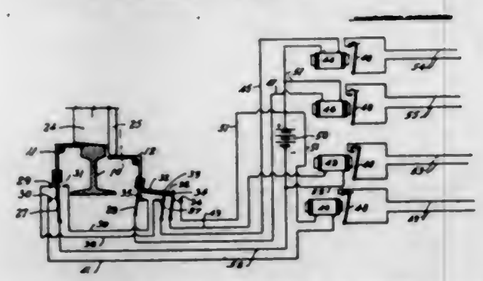
to be positioned on said flat thin member, said excretion receiving member including vertically positioned side walls including a forward gateway for receiving rectal discharges, said vertical

walls being of soft resilient material, said gateway being of resilient material, means for stiffening said gate-way to provide relative rigidity thereto, including a pair of flat spring members attached to the gate-way.



2,408,551
SELF-LATCHING ELECTRIC PLUG
Louis Frank, Fellows, Calif.
Application September 20, 1943, Serial No. 503,042
2 Claims. (Cl. 173—343)

1. The combination with a two part electric plug connector, one of the parts of which is provided with a contact finger, the other part being provided with an opening for the reception of said finger, of an arm pivoted on said contact finger, a hook on the lower end of said arm, there being a shoulder formed in the body of the member having said contact finger receiving opening, which shoulder is adapted to be engaged by said hook, a head of insulating material on the upper end of said arm, and there being recesses formed in the plug member carrying the prong for receiving a portion of said head and thereby maintaining said arm in different positions.

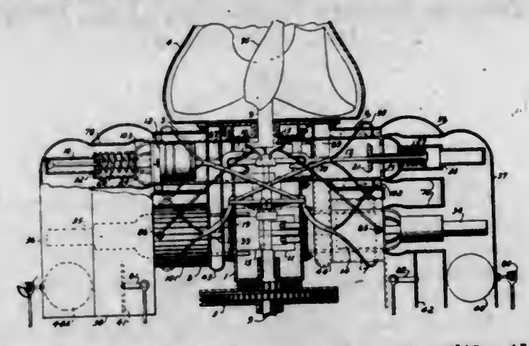


2,408,552
BALL-WINDING MACHINE
John R. Gammeter, Akron, Ohio
Application March 17, 1945, Serial No. 583,215
21 Claims. (Cl. 242—3)

1. The combination in a machine for winding continuous flexible material to form an article, of a holder for said article, a feed mechanism mounted to rotate about said holder, means rotatable with said feed mechanism for guiding continuous material from the same to said holder to wind the material on an article supported thereon, an element normally supported by a portion of said continuous material, and control means operated by said element for maintaining the machine in operative condition by the element being so supported, interruption in the con-

tinuity of said material thereby rendering the machine inoperative.

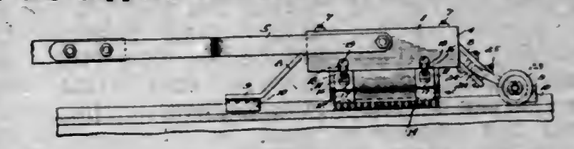
2,408,553
RAILWAY WHEEL CHECKING DEVICE
Marion W. Gieskieng and William A. Gieskieng, Denver, Colo.
Application April 24, 1945, Serial No. 590,080
3 Claims. (Cl. 246—219)



1. A railway wheel checking device for attachment to a railway rail comprising: bracket members extending oppositely outward from each side of said rail; tiltable metallic members supported between the pairs of bracket members at each side of the said rail, the metallic members on the outside of the rail being placed in the path of the tread of a wheel resting on said rail, and the metallic members on the inside of the rail being placed in the path of the flange of said wheel so that the passage of a wheel will tilt the inner portions of said members downwardly; a vertical member on each of said metallic members extending downwardly from the axis thereof; a cross rod extending through the web of said rail and through said vertical members; spring means on said cross rod at each side of each vertical member to resiliently maintain said metallic members in their normal position; and signal means for indicating deviations of said vertical members from their vertical position.

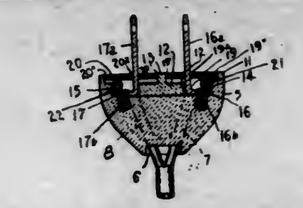
2,408,554
INTERNAL-COMBUSTION ENGINE
John Lewis Haight, Jr., Fort Worth, Tex.
Application April 21, 1945, Serial No. 589,601
12 Claims. (Cl. 123—56)

4. An internal-combustion engine of the two-cycle type comprising a crankshaft having cranks relatively disposed at 180 degrees, a crankcase including an oil reservoir; two pairs of cylinders, the components of each pair being diametrically opposed and in axial alinement, and the pairs



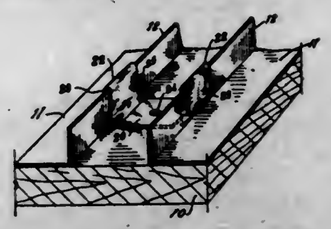
disposed in parallel relation in same plane, secured to said crankcase; a piston fitted within each cylinder and acting on and by cranks of crankshaft thru connecting-rods, the connecting-rods serving each pair of opposed cylinders bearing on a common crank; an air conduit having a forwardly faced inlet, means for regulating volume of air entering said conduit, a connection with each cylinder head, a valve for each cylinder permitting passage of air from conduit and connection into cylinder, a port, or ports, so situated in each cylinder as to be exposed during final phase of piston's downstroke and initial phase of upstroke and occluded by piston during balance of travel, means for substantially coinciding the opening and closing of cylinder's inlet and outlet means, an exhaust conduit adapted to receive and convey gases from outlet port, or ports, of cylinder, means for creating a forced draft rearwardly in air and exhaust conduits and thru cylinders when valve means are open for scavenging of combustious product gases and charging of cylinders with fresh air; means for injecting fuel into pairs of diagonally opposed

cylinders alternately to carburet with the air therein and form a combustible mixture, means of igniting said combustible mixture; means for radiating the heat of combustion from affected parts, including radiating fins on exterior cylinder walls, an air conduit having a forwardly faced inlet, a shell which envelopes said radiating fins and connects said air conduit with the exhaust conduit, which has a rearwardly faced outlet aperture, means for creating a forced draft rearwardly in air conduit, thru shell past radiating fins, and rearwardly thru and out of exhaust conduit; means for lubricating all moving parts and their bearing surfaces, including cylinder walls and valve action, and means whereby power impulses are produced simultaneously in the alternate cylinders in opposite banks and act simultaneously on both cranks of crankshaft, and means for supplying fuel to the injector means including a pair of fuel lines leading from separate fuel supply sources, a valve in each fuel line, means for operating each valve independently, a connection for each fuel line with a common conduit, and a connection, or connections, for said conduit with said injector means.



2,408,555
GREENHOUSE ROOF BAR CLEANING BRUSH
Richard C. Hart, Fairport, N. Y., assignor to Geo. B. Hart, Inc., Rochester, N. Y., a corporation of New York
Application July 21, 1944, Serial No. 546,005
4 Claims. (Cl. 15—160)

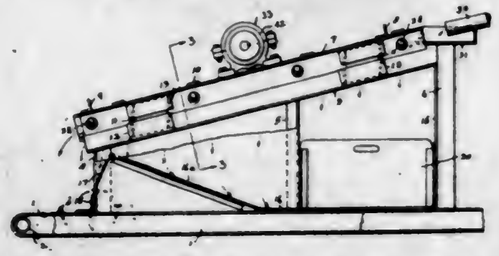
1. Brush mechanism for cleaning greenhouse roof bars comprising a horizontal weighted support having a transversely concave bottom surface, a plurality of brushes secured to the concave bottom surface of the support at the center and on opposite sides of the center at different points transversely of said concave bottom surface, a rod extending longitudinally of the bottom of the support and attached thereto, said rod



being located between the support and the brushes which are mounted on said rod, the rod terminating in bar-engaging guiding shoes, a handle, and handle-attaching means secured to said support.

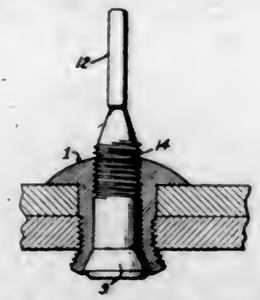
2,408,556
SAFETY PLUG-IN CONNECTOR
Carl A. Hasenwinkle, Bison, S. Dak.
Application September 30, 1944, Serial No. 556,510
1 Claim. (Cl. 173—361)

A plug-in electrical connector, comprising a body formed from insulation material and provided with a socket in one side thereof to receive the end of an electrical cord and wire passages diverging from said socket to the opposite side of said body, said body having open wells surrounding the outer ends of said divergent wire passages and semicircular pockets on each side of said body and an integral partition, a connector prong having a base snugly fitted in each well and a prong arm projecting at right angles to said base, each of said wells having a right angular shoulder engaged by its prong arm, a screw threaded through each base into said body to hold each connector prong in place, and a semicircular washer of insulating material disposed in each semicircular pocket and provided with a slot through which the prong arm thereof projects, the inner edge of each washer engaging the side of said partition and both washers being disposed flush with the outermost surface of the body adjacent thereto.



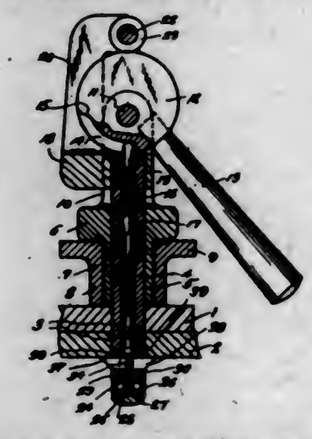
2,408,557
SHEET METAL ROOFING
Glen H. Huntington, Denver, Colo.
Application January 19, 1945, Serial No. 573,519
1 Claim. (Cl. 108—21)

Means for forming a joint between elongated strips of sheet metal roofing of the type having upwardly flanged longitudinal edges and for securing said strips to supporting sheathing comprising: a plate member having a central nail hole; an upwardly turned portion on each end of said plate; a downwardly turned extremity on each of said portions, said latter extremities be-



ing hooked over the adjacent flanged longitudinal edges of the strips, the height of said upwardly turned portions being substantially equal to the height of the flanged longitudinal edges of the elongated strips so that the mid-portion of the plate may be nailed snugly against the sheathing with its extremities overlying the flanged longitudinal edges of said strips, said downwardly turned extremities terminating above the surface of said strips; an inverted trough-like cover member; downwardly turned longitudinal sides on said cover member engaging the downwardly turned extremities on said plate; and upwardly and inwardly turned edges on sides positioned between the downwardly turned extremities of said plate and the surface of the strips to prevent upward movement of said trough-like cover.

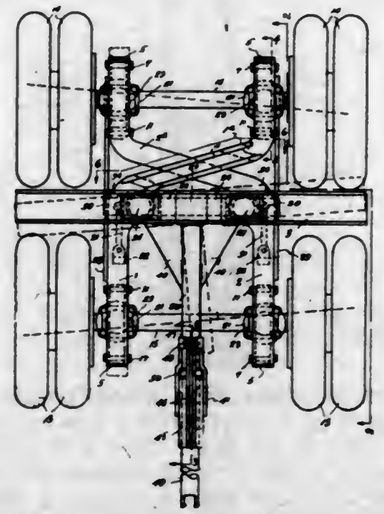
2,408,558
MUD SCREEN
Frank E. Hutchison, Houston, Tex.
Application December 13, 1943, Serial No. 514,182
3 Claims. (Cl. 210—149)



1. In a vibrating screening unit a mud box having vertical side walls, a vertical end wall at one end and a horizontal bottom, a portion of the bottom inclining toward the other end of the box, and a wall at said other end of the box which declines outwardly and whose upper margin merges with the adjacent end of the inclined portion of the bottom; and a vibratory, forwardly declining, screen mounted above the mud box and extending transversely, approximately from side to side, and longitudinally, approximately from end to end, of the box, with its upper, or feed, end above one end of the mud box and with its lower end positioned over and adjacent said outwardly declining portion.

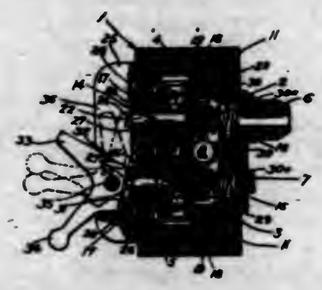
2,408,559
SELF-SETTING TUBULAR RIVET
Herbert J. Keating, Pasadena, Calif., assignor to Cherry Rivet Company, Los Angeles, Calif., a corporation of California
Application June 19, 1945, Serial No. 600,332
2 Claims. (Cl. 85—40)

1. In a tubular rivet assembly for securing a pair of workpieces together, a rivet body having a head and a shank extending therefrom for reception in aligned holes in an outer and inner workpiece to be secured together, said shank having a length sufficient to permit it to pass through the workpieces and protrude beyond the inner surface of the inner workpiece, threads on the exterior of said shank to threadedly engage at least the inner workpiece, a longitudinal bore extending through said shank and having threads threaded to a pitch opposed to the external threads on said shank, a mandrel disposed in said bore and threadedly engaging the threads in said bore, said mandrel having an enlarged head at one of its ends disposed adjacent the end of the shank, and a stem extending beyond the head of the rivet body whereby rotary movement imparted to the stem of said mandrel will first thread the shank into the workpieces and further rotary movement imparted to said stem will cause said mandrel to be moved inwardly of said rivet body to expand the end of said shank into riveted relation with said workpieces.



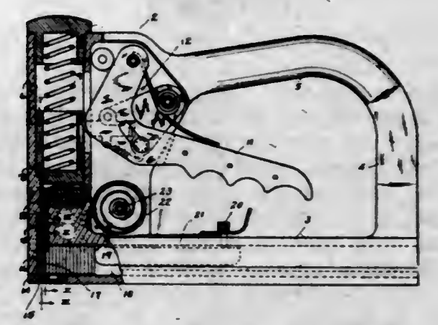
2,408,560
PLATE CLAMP
Warner L. Keehn, Spokane, Wash.
Application January 7, 1944, Serial No. 517,424
9 Claims. (Cl. 85—5)

7. A plate clamp comprising a support for resting against the upper face of plates to be secured together about registering openings formed through the plates, a shaft slidable longitudinally through the support for passing through said openings, the lower portion of the shaft being formed with a pocket having side openings, dogs pivotally mounted in said pocket and normally projecting outwardly through the side openings to an extended position, a rod shiftable longitudinally of said shaft into and out of position for depressing the dogs and effecting retraction thereof, and common means for shifting the shaft longitudinally into and out of a clamping position and depressing the rod to effect retraction of the dogs.



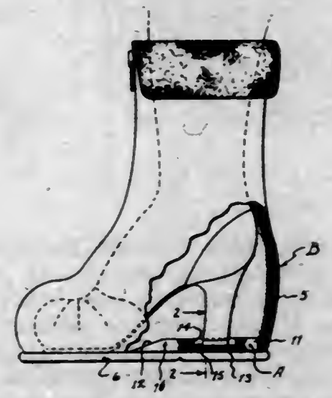
2,408,561
DUAL AXLE TRAILER
Warner L. Keehn, Spokane, Wash.
Application December 28, 1944, Serial No. 570,203
5 Claims. (Cl. 280—102)

1. A trailer comprising side beams each having forward and rear portions at opposite sides of the trailer and a diagonal intermediate portion connecting its end portions, springs carried by ends of said side beams, front and rear axles extending transversely of the side beams under said springs, housings carried by and depending from said springs, trunnions extending upwardly from said axles and rotatably received in the housings, a bunk extending transversely across said beams adjacent rear ends of their forward portions, a shaft under said bunk extending longitudinally thereof and rockably mounted, posts extending downwardly from said shaft and rotatably mounted through openings formed vertically through the side beams, collars carried by lower ends of said posts, a bridge connecting said collars and having an upper portion extending between and resting upon said side beams and formed with openings registering with the post-receiving



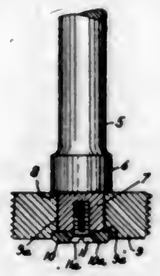
openings of the side beams, ears extending downwardly from said side beams forwardly of said posts, torque bars connecting said collars with said ears, side strips extending longitudinally of the trailer at opposite sides thereof with their forward ends fixed to forward portions of the side beams and their rear portions slidable longitudinally of the rear portions of the side beams, and means extending forwardly from the bunk for connection with a towing vehicle.

2,408,562
FLOW CONTROL VALVE
Ottmar A. Kehle, West Los Angeles, Calif., assignor to Adel Precision Products Corp., a corporation of California
Application May 28, 1943, Serial No. 488,923
3 Claims. (Cl. 277—20)



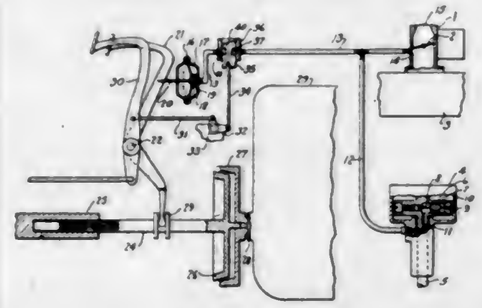
1. In a fluid control valve unit, a body member having a pair of valve-receiving bores therein in a parallel adjacent relation to each other, means for intaking fluid under pressure into one of said bores, an intercommunicating port extending through said body member and so positioned that its width bridges the space between said bores at a point intermediate of its ends to afford the passage of pressure fluid from one to the other of said bores, closure means to overlie a side of said body member for closing either of the ends of said intercommunicating port, an outlet port for each bore, valves in said bores for controlling the flow of fluid therefrom into said outlet port, spring means for seating said valves, operating means mounted on said body member for opening said valves, and bolts to cooperate with said closure means whereby two or more identical control valve units thereof may be coupled together with the aforesaid intercommunicating passages thereof in registration with one another.

2,408,563
STAPLING MACHINE AND METHOD
Joseph C. Lang, Pittsburgh, Pa., assignor to Bocji Corporation, a corporation of Delaware
Application May 16, 1942, Serial No. 443,200
6 Claims. (Cl. 1—49)



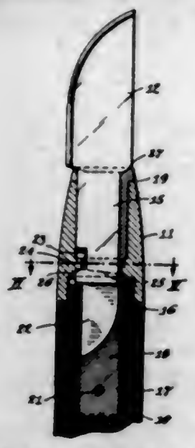
1. A stapling machine of the class described comprising a frame structure having a staple guide therein, a driver operable in the guide, means for delivering preformed staples to the guide one at a time, and means at one side of the guide in the machine for toeing the ends of the legs of the staples inwardly relative to the upper portions of the legs before they are delivered to the guide.

2,408,564
ATTACHMENT FOR STADIUM BOOTS
Harlan L. Lea, Racine, Wis.
Application February 22, 1945, Serial No. 579,171
1 Claim. (Cl. 36—1)



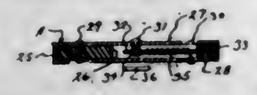
As a new article of manufacture, an attachment for women's storm boots comprising a unitary block of wear-resisting material shaped to conform to the inner configuration of the boot around the heel, said block having a flat lower serrated surface for engaging the inner face of the boot sole to prevent shifting of said block in the boot, the outer edge of said block shaped to conform to the outline of the boot around the heel, and the upper face of the block being provided with a socket for receiving the lower end of the heel of a shoe of a wearer, the lower face of the socket being serrated to prevent movement of the shoe heel in said socket.

2,408,565
DETACHABLE SCREW-CUTTING DISK AND TOOL SHANK
Chaim Lieblein, Brooklyn, N. Y.
Application June 7, 1944, Serial No. 539,068
1 Claim. (Cl. 10—141)



A thread cutting tool, comprising a shank having a polygonal stud on one end thereof and a shoulder at the inner end of said stud, said stud being disposed centrally of the shank, a disk having a central opening which receives the polygonal stud and disposed against said shoulder, said disk having a plurality of radial lands provided with screw cutting teeth, and also formed with a recess concentric with said central opening, a washer disposed in said recess and engaging the outer end of the stud, and a screw extending through the washer and threaded into the stud for retaining the disk on the stud between said washer and said shoulder.

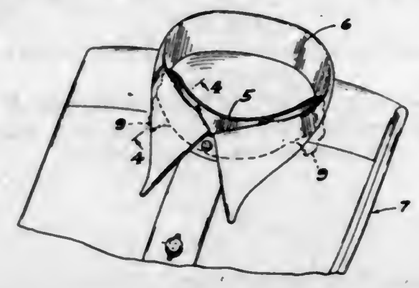
2,408,566
FREE-WHEELING DEVICE FOR AUTOMOTIVE VEHICLES
Marion Mallory, Detroit, Mich.
Application August 31, 1944, Serial No. 552,021
4 Claims. (Cl. 192—.01)



1. In an automotive vehicle including an internal combustion engine having an intake passageway, a throttle valve in said intake passageway, a driven shaft, a clutch between said engine and driven shaft, a device actuated in response to intake passageway pressure, an orifice in the intake passageway on the engine side of the throttle valve when in idle position and passing on to the atmosphere side of the throttle valve when opened beyond idle position, a conduit connecting said device into said orifice, an air bleed to atmosphere for said pressure actuated device, a centrifugally unbalanced valve rotated in accordance with the vehicle speed for closing said air bleed whenever the vehicle exceeds a predetermined speed, and a connection between said pressure actuated device and the clutch, whereby when said throttle is in engine idling position and the vehicle is traveling in excess of said predetermined speed the pressure actuated device responds to the intake passageway pressure and disengages said clutch.

2,408,567
TOOLHOLDER
Willy Mauch, Bridgeport, Conn., assignor to Bruner-Ritter, Inc., New York, N. Y., a corporation of New York
Application May 12, 1944, Serial No. 535,375
6 Claims. (Cl. 279—93)

2. In combination with a tool receiving member having a slot to receive a tool shank, a tool having a shank to enter said slot, one portion of said shank extending from said slot, said portion being provided with a notch, a ferrule carried by said member, a collar carried by said ferrule and movable therewith to enter said notch to hold said tool in said member.



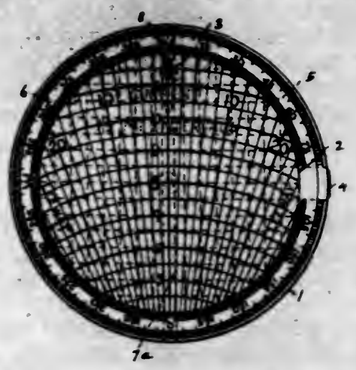
2,408,568
LOW VOLTAGE FLASHER
Chauncey H. McClure, Milwaukee, Wis., assignor of one-half to Isidore Davidoff, Milwaukee, Wis.
Application July 4, 1942, Serial No. 449,775
1 Claim. (Cl. 200—122)

A flasher or winker attachment for low voltage electric hand lamps comprising a thin body plate of insulation having an opening therethrough, thin contact plates secured to the opposite sides of said body plate and closing said opening, said conducting plates being insulated one from the other by the body plate, a thermostatic blade disposed in the opening, means firmly anchoring the outer end of the blade in the body plate, said blade being insulated from the contact plates, a contact point carried by one of the conducting plates for engaging the central contact of the bulb of the hand lamp, and a fine Nichrome wire coiled about the blade having one end electrically connected with the conducting plate opposite to the conducting plate having the contact point, and a contact point on the inner end of said blade electrically connected with the wire and normally engaging the first mentioned contact point and a resilient attaching clamp carried by one of said conducting plates for receiving the contact of the hand lamp which normally engages the central contact of the bulb.

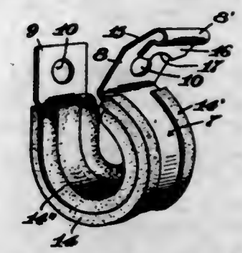
2,408,569
SHIRT COLLAR HOLDER
Charles M. Mead, Los Angeles, Calif.
Application October 30, 1945, Serial No. 625,613
2 Claims. (Cl. 223—83)

1. As an article of manufacture a collar holder consisting of an elongated flat strip of sheet material of form-retaining stiffness including a body and corner tabs on the lower edge of the body when the latter is in its operative position, said tabs joining the body along scored lines to facilitate out bending them to adapt them for insertion below the collar portion of a laundered shirt while the body portion of the holder is fitted against the inner side of said collar portion, said tabs being triangularly shaped thereby providing

them each with an outwardly directed point; which facilitates insertion of the holder into its operative position in relation to the collar portion of a laundered shirt, said outwardly directed points of the two tabs being so positioned that when the collar holder is in an extended flat position a straight line connecting them will lie in an inwardly spaced relation to the midlength portion of the convex side edge of the holder.



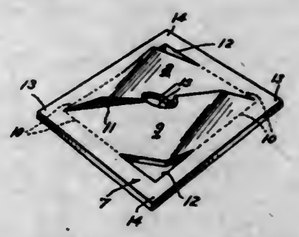
2,408,570
TURNDOWN SHIRT COLLAR
Leonard U. Michael, Montreal, Quebec, Canada
Application October 6, 1945, Serial No. 620,678
2 Claims. (Cl. 2—131)



1. A one-piece collar comprising two facing plies and a lining intermediate the facing plies, said lining comprising a plurality of plies, one of said lining plies being coextensive with the neck band and flap portions of the collar, and another of said lining plies being coextensive with the neck band portion only of the collar, said second lining ply containing thermoplastic adhesive, the upper edge of the first lining ply being connected to the edges of the facing plies, each of said lining plies being in flat engagement and adhesively united by said thermoplastic adhesive throughout their coextensive areas whereby stitching at the upper edge of the second lining ply to the first lining ply is avoided, the upper edge of the second lining ply being convexly curved so that said upper edge forms a shoulder at one side of the first lining ply which defines the fold line and upper edge of the neck band portion of the collar.

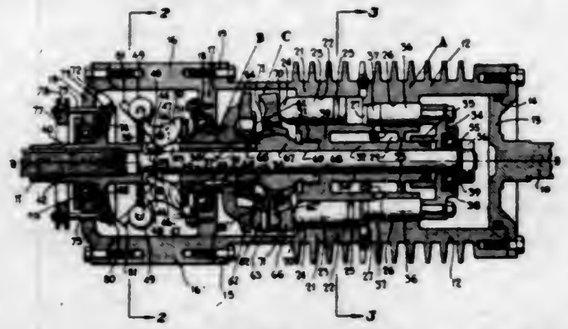
2,408,571
NAVIGATIONAL COMPUTING INSTRUMENT
Hubert L. Mitchell, Houston, Tex.
Application April 24, 1944, Serial No. 532,519
3 Claims. (Cl. 33—1)

1. An instrument of the character described comprising a compass rose, a current grid thereon having a diametrical course pointer, a track mounted to rotate on substantially a common axis with the current grid and compass rose, a leeway grid mounted to slide on said track radially with respect to and substantially entirely across the current grid and compass rose.



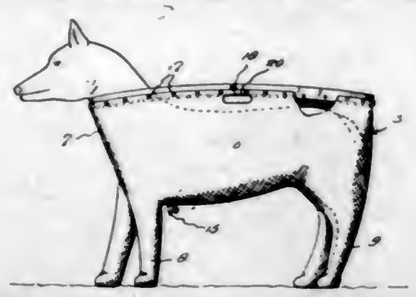
2,408,572
WIRE OR CONDUIT CLIP
Eugene M. Morehouse, Tujunga, Calif., assignor to Adel Precision Products Corp., a corporation of California
Application May 15, 1944, Serial No. 535,773
7 Claims. (Cl. 248—74)

1. In a clip for supporting wires or a conduit, a spring metal strap formed into an open loop having normally spaced apart apertured end portions providing attaching ears adapted to be brought together to close the loop and to align the apertures therein for reception of a fastening for securing the clip to a support, and a spring locking tongue on one of said end portions, said tongue having its outer end edge disposed to have tensioned end contact with the fastening to hold the clip thereon and being movable out of locking contact with the fastening responsive to the flexing of said one end portion toward the other end portion.



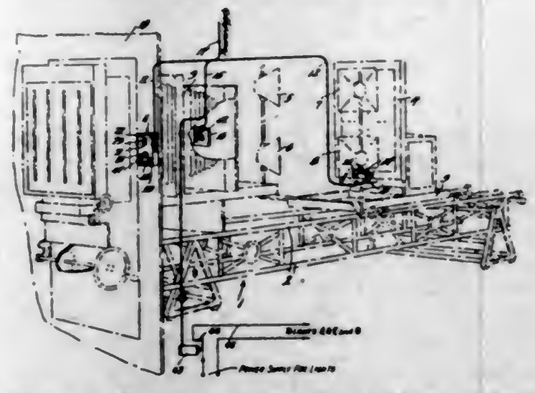
2,408,573
SHEET METAL NUT
Eugene M. Morehouse, Tujunga, Calif., assignor to Adel Precision Products Corp., a corporation of California
Application August 28, 1945, Serial No. 613,113
4 Claims. (Cl. 85—36)

1. In a sheet metal nut, a sheet metal body portion, and a pair of opposed bridge portions formed on said body portion with their corresponding ends joined to said body portion on lines extending at right angles to one another and their adjacent edges extending diagonally across the



body portion from the points where said right angular lines meet one another, there being angular slits in the body portion defining edges of said bridge portions which are separated from said body portion; the adjacent edges of said bridge portions being formed with edge portions for engaging the threads of a screw turned therebetween.

2,408,574
HYDRAULIC TRANSMISSION
Thomas L. Morris, Van Nuys, Calif., assignor of one-half to Floyd M. Boes, North Hollywood, Calif.
Application May 12, 1943, Serial No. 486,661
19 Claims. (Cl. 192—59)



1. In a power transmission of the character described, the combination of: first and second rotatable members disposed in cooperative relation on a common axis, there being means to connect one of them to a device to be driven and the other of them to a rotating drive means; a plurality of cylinders carried by said first member around said common axis, said cylinders having ports through which liquid may flow; means for holding a body of liquid so that it may flow in and out of said ports; valve means for opening and closing said ports; pistons operable in said cylinders; means for operating said pistons comprising a wobble plate supported so that it will oscillate and consecutively actuate said pistons in said cylinders, said wobble plate being movable between a position normal to said axis and a position diagonal to said axis; and means for moving said wobble plate from said position normal to said axis and causing the same to wobble in a diagonal position and for simultaneously applying a closing movement to said valve means.

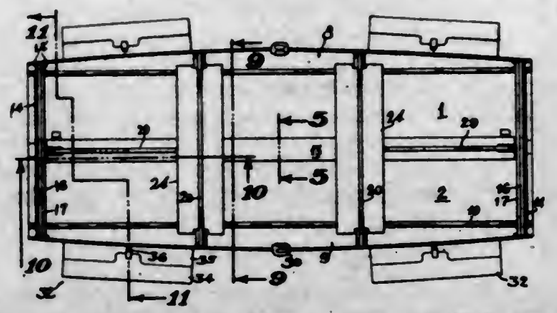
2,408,575
GARMENT FOR ANIMALS
Axel Norvig, Brooklyn, Conn.
Application September 18, 1943, Serial No. 502,975
2 Claims. (Cl. 119—156)

1. In a garment of the class described, a body portion including appendages closed except for communication with the body portion and a neck portion, said body portion having an opening extending into the neck portion to permit an animal to be arranged therein with the head of the animal located exteriorly of the body portion, drain means for the body portion, and a foldable flexible frame secured to the body and neck portions at their openings and manually flexed for constricting the upper edge of the body and neck portions about the animal, said garment having finger openings adjacent to the frame.

2,408,576
APPARATUS FOR INTEGRATING RADIANT ENERGY
Clarence S. Ost, Atlantic City, N. J.
Application July 14, 1945, Serial No. 605,124
4 Claims. (Cl. 250—41.5)

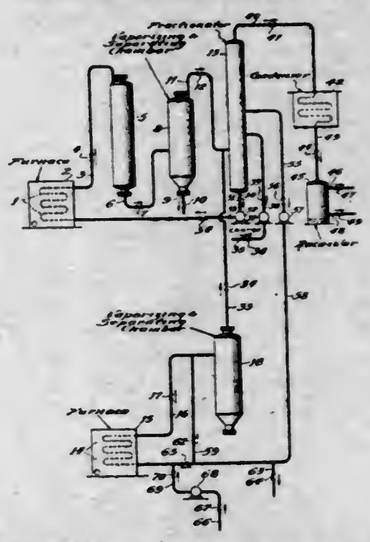
2. In a radiant energy integrating system for automatically predetermining exposures by a source of spectral rays of variable light intensities; a control circuit; an electronic circuit including a light responsive device subjected to the variable light intensities; a power amplifier tube including a cathode, a control grid, a screen grid, and an anode; an anode circuit connected between said anode and cathode and including electro-magnetic means therein; a source of D. C. potential connected in circuit with said electromagnetic means, one side of said light responsive device being connected to said source of D. C. potential; a cold cathode gaseous discharge tube of the two element type connected from its one side to the other side of said light responsive device, and the other side of said gaseous discharge tube connected to said control grid; a condenser and resistor connected in series and disposed in shunt to said gaseous discharge tube; a cathode bias resistor and bypass condenser connected in shunt and disposed between said cathode and the junction point between said first mentioned resistor and said first mentioned condenser, whereby the charge delivered by said light responsive device charges said first mentioned condenser at a rate dependent upon the intensity of light to which said light responsive device is subjected for affecting a discharge through said gaseous discharge tube and applying a change of potential to said control grid for controlling current flow in said anode circuit, thereby energizing the electro-magnetic means therein at a rate dependent upon the intensity of light to which said light responsive device is subjected; an electric switch disposed in said control circuit; a selectively settable actuator for operating said electric switch; a double pallet lever escapement mechanism for controlling the movement of said actuator; said electro-magnetic means controlling the movement of said double pallet lever escapement mechanism at a rate proportional to the rate of operation of said electronic circuit for affecting the operation of said electric switch when a predetermined quantity of light has been incident upon said light responsive device.

2,408,577
PLASTER BANDAGE MACHINE
Jack R. Pava, Santa Barbara, Calif., assignor of one-half to Douglas F. Pincock, Santa Barbara, Calif.
Application August 1, 1944, Serial No. 547,596
5 Claims. (Cl. 91—32)



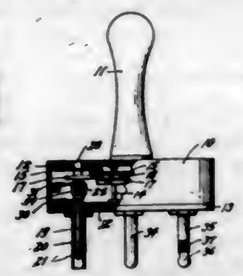
1. A machine for impregnating a fabric strip with a dry powder which comprises: a container; means for conducting a strip of fabric in yieldable contact with the upper surface of a mass of powder in the container; scraper means for removing excess powder from the surface of the strip of fabric; and means for forming a loose roll of the powder impregnated strip of fabric.

2,408,578
METHOD OF STENCILING
Joseph T. Penton, Pasadena, Calif.
Application December 18, 1942, Serial No. 469,389
9 Claims. (Cl. 117—8.5)



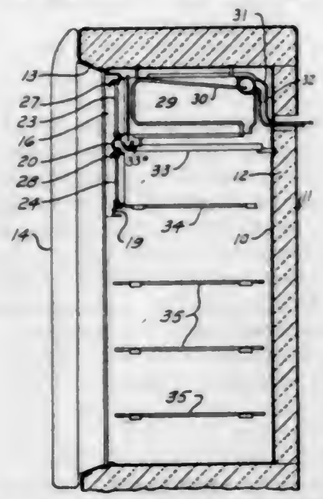
2. The herein described method of coating an article comprising applying a ground coat, applying a friable layer to completely cover the ground coat, removing a portion of the layer to expose a portion of the ground by arranging a stencil over the layer and removing the portion of the layer which is left exposed by the stencil, applying a coat which is chromatically different from the ground over the exposed portion of the ground and over the remaining portion of the friable layer, and then removing said remaining portion of the layer and the portion of said coat thereon.

2,408,579
FOLDABLE BOAT
Benjamin F. Randrup, Brisbane, Calif.
Application May 22, 1944, Serial No. 536,811
5 Claims. (Cl. 9—2)



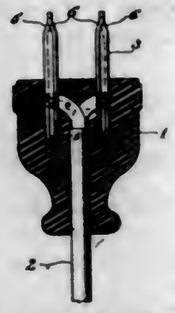
1. In a collapsible boat, a pair of elongated bottom members flexibly connected longitudinally along adjacent side edges, two elongated side members flexibly connected to the outwardly disposed longitudinal edges of the bottom members, the said side members each being arranged to fold upon its associated bottom member, foldable end members pivotally connected to and foldable upon the bottom members, the said end members being arranged in pairs and each pair being positioned to close an end of the boat, and a plurality of pairs of rigid frame members pivotally connected to and folded upon the bottom members and normally interposed between the side and bottom members for maintaining them in unfolded positions, the pairs of rigid frame members each comprising two angular members connected to the bottom members and arranged to engage with the side members, and seats pivotally connected to and foldable upon the frame members.

2,408,580
HYDROCARBON CONVERSION PROCESS
Davis Read, Jr., Riverside, Ill., assignor to Universal Oil Products Company, Chicago, Ill., a corporation of Delaware
Original application April 29, 1940, Serial No. 332,136. Divided and this application September 27, 1943, Serial No. 503,903
3 Claims. (Cl. 196—49)



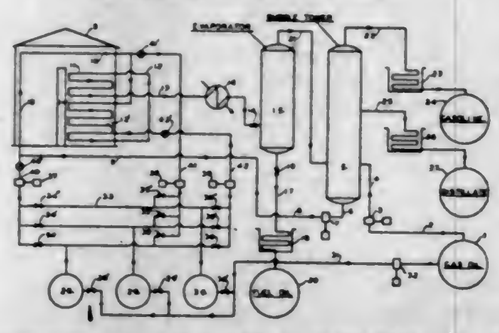
1. A process for the production of motor fuel which comprises subjecting a relatively heavy hydrocarbon oil to pyrolytic cracking in a heating coil and communicating reaction chamber, separating non-vaporous liquid residue from the pyrolytically formed vaporous conversion products, simultaneously therewith commingling a slurry of cracking catalyst with a relatively light hydrocarbon oil and passing the mixture through a reaction zone wherein it is heated to a catalytic cracking temperature, commingling a relatively cool oil with the heated stream of hydrocarbon oil and catalyst leaving the reaction zone to arrest the cracking reaction, supplying the quenched stream of oil and catalyst to a vaporizing and separating chamber wherein said catalyst is reduced to a substantially dry powder containing a high proportion of carbonaceous materials by substantially completely vaporizing the hydrocarbon introduced to said chamber and separating therefrom vaporous products substantially free of entrained catalyst, commingling the last-named vaporous products with said pyrolytic vaporous conversion products and fractionating the mixture together with the charging oil to separate fractionated vapors boiling in the range of gasoline from the higher boiling conversion products and charging oil, recovering said fractionated vapors, withdrawing said higher boiling conversion products and charging oil as light and heavy reflux condensates, supplying said heavy reflux condensate to the pyrolytic conversion treatment as said relatively heavy oil and supplying a portion of said light reflux condensate to the catalytic conversion step as said relatively light hydrocarbon oil, and utilizing another portion of said light reflux condensate as said relatively cool oil.

2,408,581
SELF-SERVE AUTOMATIC REGISTERING DEVICE
Milton Rifkin, Denver, Colo.
Application June 21, 1943, Serial No. 491,713
7 Claims. (Cl. 235—1)



2. A registering device for operating an electrically controlled dispensing machine comprising: a housing; registering mechanism in said housing; means on said housing for closing the circuit when said key is inserted in the dispensing machine; and means on said key for driving said registering mechansm in consequence of operation of the machine.

2,408,582
REFRIGERATOR
Homer E. Rosebrook and Herschel F. Powell, Greenville, Mich., assignors, by mesne assignments, to Gibson Refrigerator Company, Greenville, Mich., a corporation of Michigan
Application November 5, 1942, Serial No. 464,608
10 Claims. (Cl. 62—103)



1. A mechanical refrigerator comprising a storage chamber, a refrigerant evaporator disposed in the chamber, a drip pan disposed below and in closely spaced relation to the evaporator for collecting the drip from the evaporator, a substantially imperforate food storage shelf positioned below and in spaced relation to the drip pan, said pan and said shelf being constructed and arranged in relation to the storage chamber to provide passageways adjacent the perimeters thereof for a limited circulation of air between the spaces thereabove and therebelow, the cross sectional area of the passageway for the circulation of air adjacent one portion of the perimeter of the shelf being larger than the cross sectional area of the passageway adjacent the corresponding portion of the perimeter of the drip pan, and the cross sectional area of the passageway adjacent another and remote portion of the perimeter of the shelf being smaller than the cross sectional area of the passageway adjacent the corresponding portion of the perimeter of the drip pan.

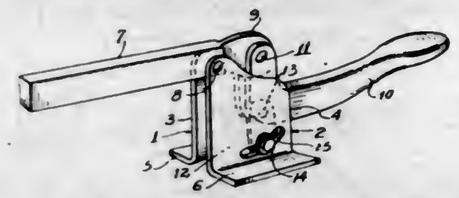
2,408,583
CORD TERMINAL PLUG
John M. Sions, Middle River, Md.
Application July 7, 1943, Serial No. 493,725
5 Claims. (Cl. 173—361)

1. An electrical contact plug having therein a plurality of longitudinally projecting polygonally cross-sectioned blades to be thrust into correspondingly shaped openings in an electrical socket, each blade being mounted in the plug in a longitudinally twisted position relative to the walls of the corresponding openings, and being formed to provide an oblique biasing surface adapted to serve as a sliding pressure surface, whereby the blades are placed under torsional strain upon their insertion thereinto.

2,408,584
HYDROCARBON CRACKING PROCESS WITH SUCCESSIVE ADDITIONS OF ADSORBENT
Arthur D. Smith, Park Ridge, Ill., assignor to Jenkins Petroleum Process Company, Chicago, Ill.
Application February 10, 1945, Serial No. 577,217
In Canada September 27, 1944
6 Claims. (Cl. 196—55)

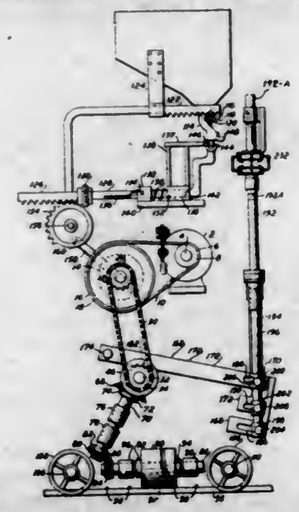
1. Process of minimizing corrosion in an oil cracking still, which comprises: supplying to the stream undergoing heating, successive increments of an adsorbent consisting essentially of calcium hydroxide and adapted to react with corrosive compounds generated by decomposition of ingredients in the oil; and timing said increments so as to add each increment at substantially the time that the previous increment ceases to liberate structural water.

2,408,585
METHOD OF LAYING, FORMING, AND INTERCONNECTING CONCRETE BLOCKS
Jesse W. Smith, Cobleskill, N. Y.
Application December 29, 1944, Serial No. 570,443
2 Claims. (Cl. 94—22)



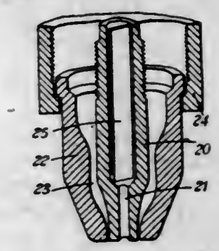
1. A method of constructing a concrete highway comprising placing and setting conventional forms in the usual manner on a sub-grade, pouring the lower half of a concrete block, placing a metal tie diagonally on the corner area of the top surface of said lower half, the outer end of said tie having an eye, placing a removable plug

in the eye, placing a core in the concrete around the plug and eye, and then pouring the remainder



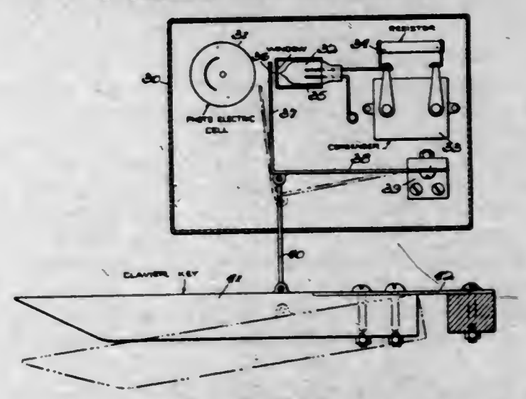
forming the upper half of said block within the limits of the form and embedding said tie.

2,408,586
ADJUSTABLE HOLD-DOWN DEVICE
Louis A. Spievak, West Los Angeles, Calif.
Application March 29, 1943, Serial No. 480,913
1 Claim. (Cl. 144—290)



In a hold-down device for securing a workpiece to a working surface, the combination of: a support member adapted to rest upon the working surface, a clamping bar; means pivoting said clamping bar upon said support member for movement between a working position disposing the end of the bar a predetermined distance above the working surface to engage and clamp a workpiece against the working surface and a non-working position disposing the end of said bar at a greater distance from said surface; a handle member for moving said bar between said two positions; means pivotally interconnecting said handle with said bar; and means pivotally connecting said handle to said support including a pivot member engageable with said support, a slot in said support for receiving said pivot member, said slot extending at an acute angle relative to the working surface whereby positioning of said pivot member at different positions along said slot will fix the working position of the end of said bar at different predetermined distances above said working surface to thereby accommodate workpieces of different thicknesses, and means for locking said pivot means in any position along said slot.

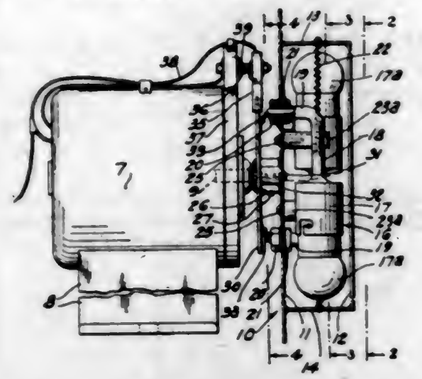
2,408,587
TEXTILE MACHINERY
John W. Tucker, Manchester, Ga.
Application January 11, 1945, Serial No. 572,320
12 Claims. (Cl. 57—53)



1. In combination with a spinning machine, having conveyor tracks alongside the frame, a doffing device comprising, an empty bobbin container, an arm and bobbin holder for transferring empty bobbins from said empty bobbin container to a position directly over a spindle of said spinning machine, a second arm and bobbin holder to doff the spindles of said spinning machine, a third arm and bobbin holder to remove the full bobbins of yarn from the grasp of said second bobbin holder, and a cylindrical cam for conveying said doffing device along said tracks.

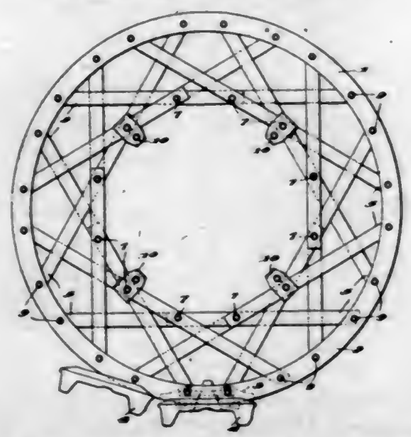
2,408,588
APPARATUS FOR DIVIDING OR DESURFACING METAL BY USE OF OXIDIZING SETS
Sidney Sprague Watts, Southgate, London N. 14, England, assignor to The British Oxygen Company Limited, London, England, a British company
Application August 6, 1941, Serial No. 405,670
In Great Britain September 20, 1940
5 Claims. (Cl. 158—27.4)

1. A nozzle for a blowpipe torch comprising a member having a cylindrical axial passage for an oxidizing gas, a relatively short delivery passage of relatively lesser diameter than said cylindrical axial passage for forming said gas into a jet, a tapering transition passage between said axial passage and said delivery passage, and anti-swirl means in said axial passage and extending to said tapering transition passage for delivering thereto a gas stream having reduced swirl characteristic.



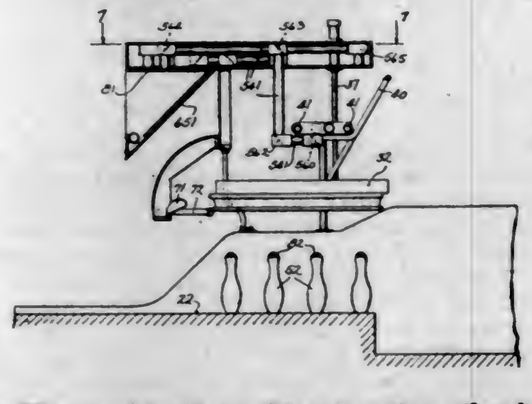
2,408,589
APPARATUS FOR PRODUCING ELECTRICAL OSCILLATIONS
Alvin W. Wells, Chicago, Ill., assignor of one-half to Jewel W. Wells, Decatur, Ill.
Application May 13, 1942, Serial No. 442,804
3 Claims. (Cl. 250—41.5)

1. A light sensitive system comprising a plurality of glow discharge tubes, oscillating circuits continuingly energizing said tubes, means for tuning each of said circuits to a certain frequency, electric means outside of said oscillating circuits adapted to respond to the fluctuating light emitted by said tubes, means normally shielding said photo-electric means from said light, selectively operable means whereby said shielding



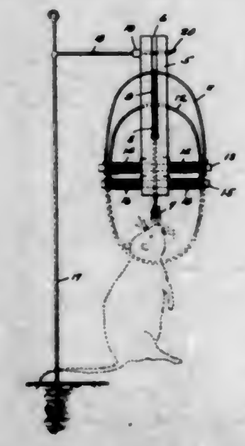
means is rendered ineffective as regards the light emitted by one or more of said tubes so that said photo-electric means is correspondingly activated, and an amplifier fed by said photo-electric means.

2,408,590
MOTOR-DRIVEN SIGNAL
Ervin L. Williams, Los Angeles, Calif.
Application March 3, 1945, Serial No. 580,822
6 Claims. (Cl. 177—329)



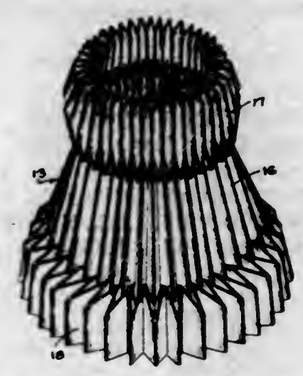
2. In a stop light means for vehicles, an electric motor mountable upon a vehicle and provided with a power transmission shaft which projects toward the rear of the vehicle when said motor is mounted thereon, a circular housing comprising parallel spaced apart front and rear disks of unequal diameters axially secured to said shaft and having open peripheral portions between them, at least one electric lamp swingably mounted within said housing for extension through said open peripheral portions under the urge of centrifugal force when said shaft and housing are rotated by said motor, the increase in diameter of one disk over the other comprising an annulus forming a background screen against which the moving lamp is outlined, and yielding means carried by said housing and tending to retract said lamp thereinto.

2,408,591
DEMOUNTABLE TRACTION UNIT FOR TRACTOR WHEELS
William E. Wine, Toledo, Ohio
Application October 19, 1944, Serial No. 559,389
5 Claims. (Cl. 301—56)



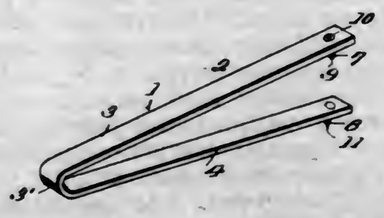
1. A demountable annular traction unit adapted to form the peripheral portion of a tractor wheel, said unit comprising a rim portion, and a plurality of spokes arranged within said rim portion as the chords of a circle, each of said spokes consisting of two plate-like members having their inner portions secured together in overlapping relation and the overlapping portions of the members of each spoke being secured in overlapping relation to the overlapping portions of the members of an adjacent spoke, and means respectively connected to the overlapping portions of the members of some of said spokes adapted to receive means for connecting the unit to the tractor wheel.

2,408,592
BOWLING PIN SETTING INDICATOR
Rudolph A. Aschenbrener, Milwaukee, Wis., assignor to The Triple Insulaire Company, Milwaukee, Wis., a corporation of Wisconsin
Application March 5, 1943, Serial No. 478,130
18 Claims. (Cl. 273—37)



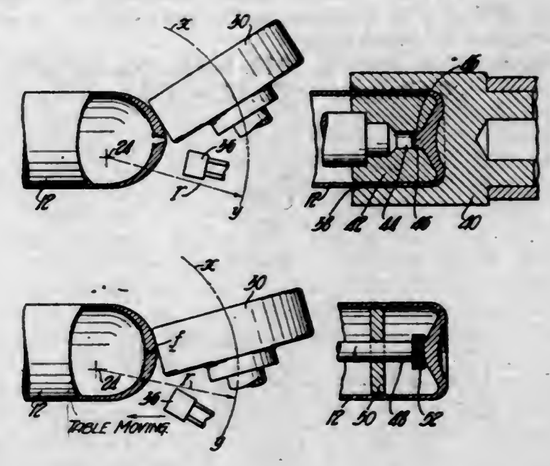
18. The combination with a bowling alley having a floor portion provided with designated areas with which the respective pins are to be located of indicating means for showing to a remote observer whether the respective pins are properly located with regard to their respective areas aforesaid, said indicating means comprising light means at one side of the respective areas, light receiving means at the other side of the respective areas, the pin being adapted to intercept at least a part of the light passing from the source means to the receiving means of each area, and means for rendering apparent to the remote observer whether the light intercepted by each pin is in accordance with a predetermined arrangement.

2,408,593
ANIMAL TRAP
Paul M. Barber, Aberdeen, S. Dak.
Application February 21, 1945, Serial No. 578,967
1 Claim. (Cl. 43—89)



An animal trap comprising an elongated body portion having a central longitudinal bore extending from one end of said body portion, said body portion having a slot extending transversely therethrough and communicating with the bore, a rod slidably mounted within the bore and slot, one end of said rod extending laterally through the slot, an arm extending from the rod and passing through the slot at the opposite side of the body portion, and a pair of swinging jaws pivotally connected with the body portion and adapted to swing beyond one end of the body portion, one of said jaws adapted to engage the end of the rod, the opposite jaw adapted to engage the arm secured to the rod, holding the jaws in their set positions, said rod adapted to move downwardly releasing the jaws, and said jaws adapted to swing into gripping relation with respect to each other.

2,408,594
LAMP SHADE AND METHOD OF MAKING THE SAME
Sandor B. Bartha, Philadelphia, Pa., assignor to Max Galman, Philadelphia, Pa., trading as Imperial Lamp and Shade Company
Application May 27, 1944, Serial No. 537,745
3 Claims. (Cl. 240—108)

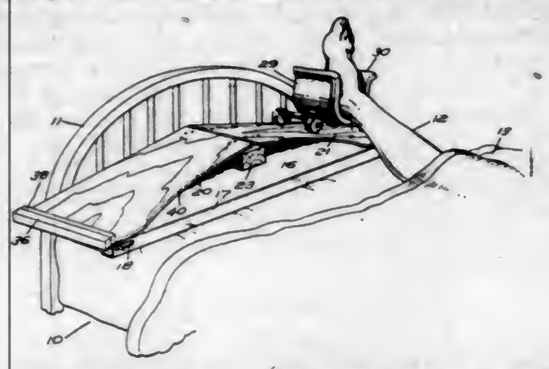


1. In a lamp shade a pleated fabric arranged in frusto-conical shape, said fabric having a plurality of adjoining pleated sections, the fold lines of which are parallel, two of said sections of pleated fabric being of similar conformation to form the end portions of the lamp shade, the fold lines of said end portions being respectively outwardly offset relatively to the corresponding parallel fold lines of the central portion of the lamp shade to provide a double gallery effect, and means disposed within the lamp shade for maintaining said fabric in said frusto-conical shape.

2,408,595
POINT MARKER
Charles L. Beard, Lancaster, Pa.
Application June 6, 1944, Serial No. 538,915
1 Claim. (Cl. 33—189)

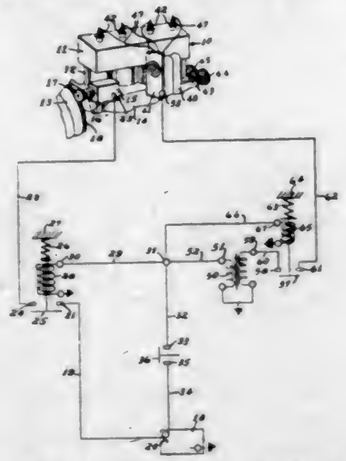
A tool for marking sheet metal comprising a strip of resilient material bent intermediate its ends to form lower and upper connected resilient arms, each arm provided with a downwardly tapered member at its free lower end, the upper surface of the tapered member of the lower arm being flat, the free ends of said arms being movable towards each other against the inherent resiliency of said strip whereby said tapered members are adapted respectively for locating a hidden depression or hole in the upper face of a metal sheet and to apply a correspondingly located mark in the upper face of a second metal sheet superimposed on said first mentioned sheet, when said lower arm is inserted between said metal sheets and said upper arm is moved toward said second sheet.

2,408,596
METHOD OF FORMING CYLINDER ENDS
Joseph J. Bednar and Steven P. Peck, McKeesport, Pa., assignors to National Tube Company, a corporation of New Jersey
Application March 13, 1944, Serial No. 526,253
2 Claims. (Cl. 29—148.2)



1. A method of spinning closed ends on tubular metal workpieces, comprising rotating the workpiece and applying a work-engaging tool to the end portion thereof, moving said tool through arcs extending from the periphery toward the longitudinal axis of the workpiece, moving said tool longitudinally of the axis of the workpiece to bring the end edges of said workpiece into abutment in the region of the longitudinal axis thereof, and thereafter continuing the movement of said tool in arcs extending from the periphery to the point beyond the longitudinal axis of the workpiece to upset said end portion and build up metal of substantial thickness without a fissure outside the original point of juncture of said edges, stopping rotation of the workpiece, then extruding the axial portion of said closed end inwardly into an axial cavity in a die member in the region of the point of juncture of said edges, said extruding step causing feather-like portions to be forced axially into said die cavity, and finally removing said axially extruded feather-like portions.

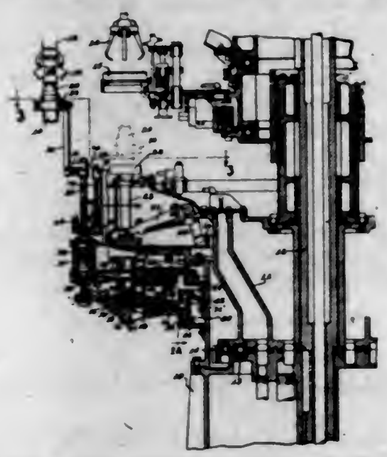
2,408,597
EXERCISING DEVICE
Theodore H. Belling, Barrington, R. I., assignor to Fram Corporation, a corporation of Rhode Island
Application July 13, 1945, Serial No. 604,747
10 Claims. (Cl. 272—57)



1. An exercising device comprising a carriage shaped to receive the foot of the user and sup-

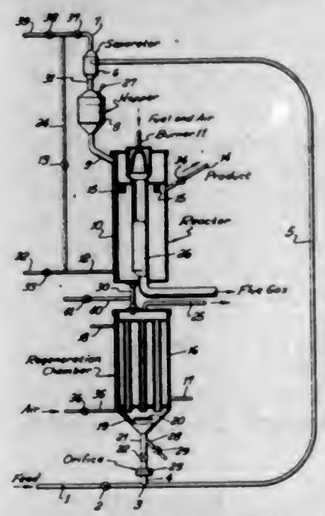
port the leg when lying prone, rolling means supporting said carriage and arranged to direct said

carriage on the arc of a circle having a radius substantially the length of the leg.



2,408,598
INTERNAL-COMBUSTION ENGINE
Lester L. Beltz, Detroit, Mich., assignor to Packard Motor Car Company, Detroit, Mich., a corporation of Michigan
Application June 2, 1944, Serial No. 538,376
6 Claims. (Cl. 123—179)

1. In an electric sparking system having a magneto and a distributor in which an electrode is rotated by the engine and engages contacts to complete circuits from the magneto to spark plugs, the combination with a booster circuit having a grounded booster coil and a booster electrode for engaging the distributor contacts, said booster electrode rotating with and trailing the distributor electrode, of switch means in the booster circuit between the coil and the electrode.

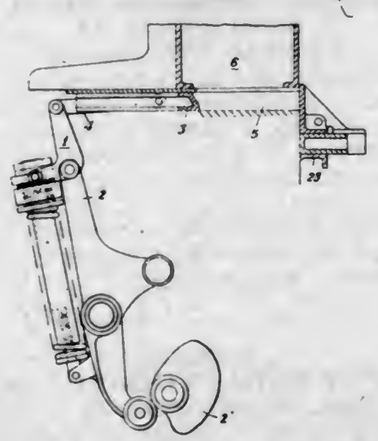


2,408,599
ARTICLE TRANSFER MECHANISM
Edward H. Bennett, Toledo, Ohio, assignor to Owens-Illinois Glass Company, a corporation of Ohio
Application June 5, 1945, Serial No. 597,687
9 Claims. (Cl. 198—210)

1. The combination of a carriage mounted to rotate about a vertical axis, article transfer mechanism comprising a vertical rock shaft journaled on the carriage to rock about its vertical axis, a transfer arm fixed to said shaft and extending laterally therefrom, an article holder comprising a pair of jaws pivotally mounted on said arm for swinging movement toward and from each other, automatic means controlled by the rotation of the carriage for rocking said shaft and thereby swinging said holder from an article-receiving position between the rock shaft and the axis of the carriage and a discharging position laterally beyond the carriage, means controlled by the rotation of the carriage for lifting and lowering the rock shaft and transfer

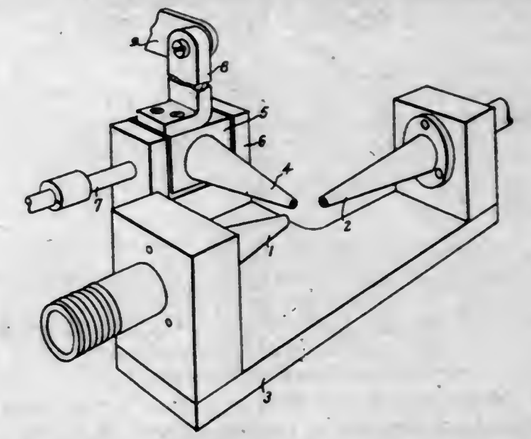
arm, and means operable by and during the upward movement of the transfer arm to swing the jaws toward each other to an article-holding position and operable by the downward movement of the transfer arm to swing the jaws apart.

2,408,600
CRACKING PROCESS
Clyde H. O. Berg, Long Beach, Calif., assignor to Union Oil Company of California, Los Angeles, Calif., a corporation of California
Application September 22, 1943, Serial No. 503,345
7 Claims. (Cl. 196—52)



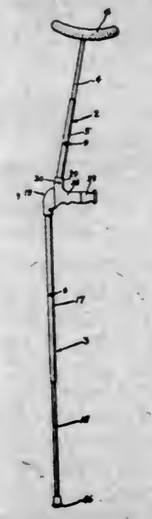
1. A process for the catalytic conversion of hydrocarbons which comprises flowing a granulated catalyst downwardly by gravity through successive zones of reaction and regeneration, introducing hydrocarbons into said reaction zone and maintaining an elevated conversion temperature therein while said hydrocarbons flow through said reaction zone countercurrently to said flowing catalyst, regenerating said catalyst in said regeneration zone, withdrawing regenerated catalyst from said regeneration zone, suspending said withdrawn catalyst in a suspension gas to thereby lift said catalyst and pass it to a separating zone, separating said catalyst from said suspension gas in said separating zone, passing said separated catalyst to said reaction zone, and introducing said separated suspension gas into said reaction zone with said hydrocarbons.

2,408,601
WORK ILLUMINATING TOOL
Benjamin Blauvelt, Paterson, N. J.
Application April 8, 1944, Serial No. 530,109
1 Claim. (Cl. 240—6.46)



The combination of a handle having a bore open at one end of the handle, an elongated tool-holder removably affixed to and abutting the handle at and projecting beyond said end of the bore and, from near its own free end to near the handle, being cylindrical and coaxially related to the bore and being also transparent, said tool-holder from near its free end to the handle being of appreciably greater diameter than the bore and having a tool-socket extending from its said free end toward but terminating remote from the handle and of appreciably less diameter than the bore and coaxial with the bore, said tool-holder, except for said socket, being otherwise solid from end to end and illuminating means in the bore adjacent said open end thereof, said tool-holder having at its end-portion adjacent the handle a plug extending therefrom into and fitting the bore.

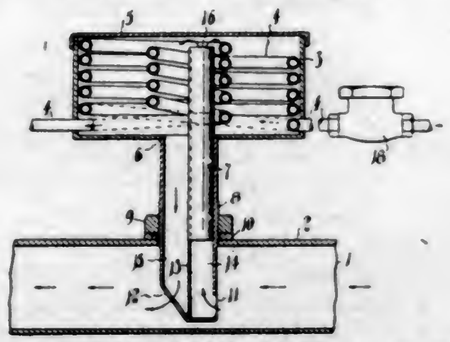
2,408,602
DOUGH DIVIDING MACHINE
Harry Whalley Bowker, Peterborough, England, assignor to Baker Perkins Limited, Peterborough, England
Application June 27, 1944, Serial No. 542,339
In Great Britain December 10, 1943
4 Claims. (Cl. 107—15)



1. A dough dividing machine comprising a reciprocating ram, a cam-operated oscillating lever, a coupling rod between the lever and the ram, spring means between the lever and the coupling rod providing a yielding pressure of the ram on the dough and a lost-motion transmission incorporationg resilient buffer means located between said spring means and the coupling rod, to impart a shorter cushioned dividing stroke to the ram when dividing dough pieces of the lesser weight for which the machine is designed.

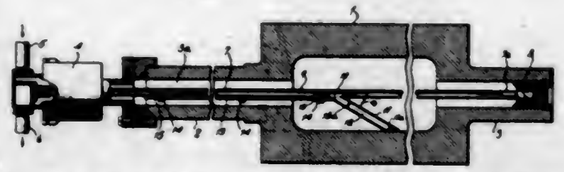
2,408,603
MECHANICAL RELAY OF THE FLUID JET TYPE
Robert Cecil Braithwaite and Kenneth Wilcox, Manchester, England, assignors to Metropolitan-Vickers Electrical Company Limited, London, England, a company of Great Britain
Application October 9, 1943, Serial No. 505,708
In Great Britain May 28, 1940
4 Claims. (Cl. 137—111)

1. A mechanical relay of the fluid jet type, comprising a pair of fluid jet nozzles arranged in substantially axial alignment and facing one another whereby pressure fluid supplied to one nozzle produces a fluid jet therefrom which normally tends to enter the orifice of the other nozzle, and a third nozzle arranged with its axis substantially at right angles to and in proximity to said jet whereby pressure fluid supplied to said third nozzle produces a fluid jet which impinges upon the first-mentioned jet, said third nozzle being so movably mounted relatively to said pair of nozzles as to cause its jet to variably impinge upon the first-mentioned jet in accordance with the movements imparted to said third nozzle and to thereby vary the amount of fluid entering said orifice of said other nozzle.



2,408,604
CRUTCH
Thomas B. Brickson, Hollywood, Calif., assignor to Al R. Brooks, Los Angeles, Calif.
Application November 22, 1944, Serial No. 564,565
17 Claims. (Cl. 135—50)

2. A crutch comprising an upper section and a lower section joined together intermediately of the ends of the crutch, a hand grip extending



laterally from the connection between said sections, and the lower section being capable of laterally flexing under the weight imposed thereon by the user's body.

2,408,605
FUEL HEATER FOR INTERNAL-COMBUSTION ENGINES
Charles F. Brookes, Toronto, Ontario, Canada
Application August 28, 1944, Serial No. 551,575
5 Claims. (Cl. 257—229)

5. In a heater for fuel supplied to an internal combustion engine, a casing closed at its top end and having an opening in its lower end, a pipe leading outwardly from said opening and adapted to be inserted in the exhaust manifold of the engine, a partitioning member extending throughout the length of said pipe and dividing said pipe into two longitudinal passages leading respectively to and from said casing, said pipe having an inlet in one side thereof opposed to the inlet end of said exhaust manifold and communicating with one of said passages, said pipe also having an outlet opposed to said inlet and communicating with the other of said passages, an open end conduit registering with the passage leading to said casing and extending upwardly within said casing and terminating in slightly spaced relation to the closed end of the latter, and a fuel pipe leading through said casing and having that portion thereof located within said casing coiled around said conduit.

2,408,606
SIPHON MECHANISM FOR HEATED ROLLS
Hobart W. Bruker, Bordentown, N. J., assignor to George W. Swift, Jr. Inc., Bordentown, N. J., a corporation of New Jersey
Application April 14, 1945, Serial No. 588,319
5 Claims. (Cl. 138—38)

1. Siphon mechanism for heated rolls comprising an elongated exhaust conduit member provided with supporting portions therefor at both its ends and also having an exhaust passageway therein leading out through one end portion thereof, said exhaust conduit member also having a port located at an intermediate portion thereof and affording communication between said passageway and a point exterior to said exhaust conduit member, a tubular siphon member, and means movably connecting said siphon member to said exhaust conduit member, said connecting means affording movement of said siphon member between one position wherein it lies alongside and substantially parallel to said exhaust conduit member, and another position wherein said siphon member is directed outwardly away from said exhaust conduit member but with its inner end portion communicating with the aforesaid port.

2,408,607
MANUFACTURE OF NITRO COMPOUNDS
Gerard Dunstan Buckley, Blackley, Manchester, England, assignor to Imperial Chemical Industries Limited, a corporation of Great Britain
No Drawing. Application February 22, 1945, Serial No. 579,309
In Great Britain January 19, 1944
3 Claims. (Cl. 260—644)

1. The process for the manufacture of nitro compounds of the formula

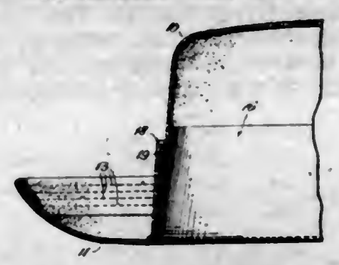
$$RR^{I}R^{II}C—CHR^{III}—NO_2$$

which comprises causing a Δ^{α}-nitroolefine of the formula

$$RR^{I}C=CR^{III}NO_2$$

to interact with an organometal halide of the formula $R^{II}MX$, and thereafter treating the reaction product with a compound selected from the group consisting of water and aqueous acid; the aforesaid symbols having respective meanings as follows:

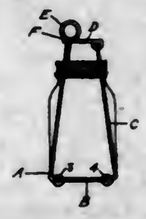
M is selected from the group consisting of magnesium and zinc;
X is a halogen;
R, R^{I} and R^{III} are respectively selected from the group consisting of hydrogen, acyclic hydrocarbon radicals, alicyclic hydrocarbon radicals, and furyl radicals; and
R^{II} is a hydrocarbon radical.



2,408,608
CHLORINATED RESINS
Oliver W. Cass, Niagara Falls, N. Y., assignor to E. I. du Pont de Nemours & Company, Wilmington, Del., a corporation of Delaware
No Drawing. Application May 24, 1943, Serial No. 488,214
2 Claims. (Cl. 260—86)

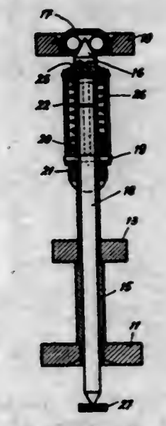
1. A polymeric product obtained by the chlorination of a copolymer of vinyl chloride and vinylidene chloride containing between 10% and 95% by weight of vinyl chloride with the remainder of said copolymer being vinylidene chloride, said polymer, as a result of said chlorination, having an increased percentage content of chlorine and an increased resistance to darkening at elevated temperatures.

2,408,609
RESINS OF HIGH CHLORINE CONTENT
Oliver W. Cass, Niagara Falls, N. Y., assignor to E. I. du Pont de Nemours & Company, Wilmington, Del., a corporation of Delaware
No Drawing. Application May 24, 1943, Serial No. 488,215
2 Claims. (Cl. 260—86)



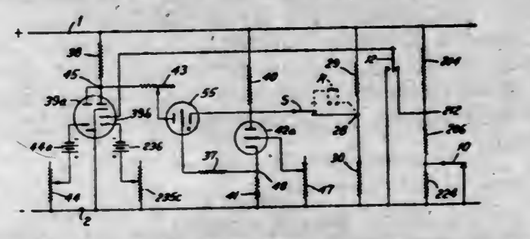
1. A polymeric product obtained by the chlorination of a copolymer of vinyl chloride and trichlorethylene prepared by copolymerization of a monomeric mixture containing between 1% and 5% by weight of trichlorethylene and the remainder of said mixture being vinyl chloride, said polymeric product, as a result of said chlorination, having an increased percentage content of chlorine and an increased resistance to darkening at elevated temperatures.

2,408,610
FABRIC HAT AND METHOD OF MAKING THE SAME
John Cavanagh, Norwalk, Conn., assignor to Hat Corporation of America, Norwalk, Conn., a corporation of Delaware
Application December 11, 1943, Serial No. 513,878
10 Claims. (Cl. 2—192)



4. A felt hat having a brim having the material of the outer circumferential edge portion thereof folded back on itself to form a double thickness at said edge, the folded portion of the brim material having a radial cross-section tapering to a lesser thickness at the inner circumferential edge of said folded portion, and the material of the brim alongside of the inner circumferential edge of the folded portion being of less than normal thickness, so that the double thickness of the brim substantially merges into the single brim thickness at said inner circumferential edge; a separate nonfeltable tape interposed in the fold of the brim edge and extending along the latter for reinforcing same; and a plurality of lines of stitches extending along the edge portion of the brim and passing through the tape and both thicknesses of the material of the brim to secure the same together.

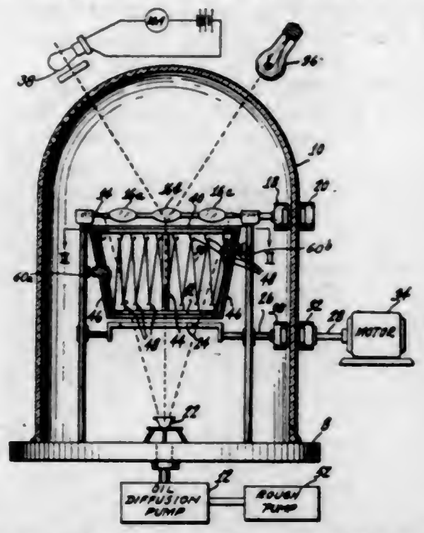
2,408,611
HOLDER FOR CONTAINERS
Albert Dawson, Tarentum, Pa.
Application November 17, 1944, Serial No. 563,919
3 Claims. (Cl. 224—48)



1. A reverse folding, two-size, completely confining holder for containers comprising a square base formed of one piece of wire with the extremities extended within the square and two opposite sides serving as axes for standards, a pair of standards and a cross member that serves as an axis formed from one piece of wire in the shape of three sides of a rectangle, the two standards being angularly disposed near the extremities of the wire and such extremities being formed into pivoting loops about one side of the square base, a single piece of wire formed into the shape of three sides of a rectangle with the extremities of the wire formed into pivoting loops about the cross member portion of the aforementioned standards, a pair of standards and a cross member formed from one piece of wire in the general shape of three sides of a rectangle and having extended therefrom at the center of the cross member portion a ring twisted at right angle to said cross member portion, the two standards being angularly disposed near the extremities of said wire and having said extremities formed into pivoting loops about the side of the base opposite to the side to which the first set of standards is attached, the angularly disposed standards folded to rise vertically from points outside the perimeter of the base and with the pivoting loop on the one set of standards dropped over the ring on the other set of standards thereby completing a structure for completely confining a container of one size or, reversed, the angularly disposed standards folded to rise vertically from points within the perimeter of the base and with the pivoting loop on the one set of standards dropped over the ring on the other set of standards thereby completing a structure for completely confining a container of another size, substantially as and for the purpose herein shown and described.

2,408,612
ESCAPEMENT ADJUSTING DEVICE
Ernest Alphonse Derungs and Oscar Chatelain, Le Locle, Switzerland
Application October 27, 1943, Serial No. 507,854
In Switzerland October 21, 1942
3 Claims. (Cl. 185—46)

1. In an adjusting device, an escapement, an axle, a vibrator lever fixed to said axle for controlling the movements of said escapement, a balance mounted on said axle, including masses displaceable in order to modify the moment of inertia of said balance means tending to displace said masses in one direction, and means passing axially through said axle for displacing the masses in the opposite direction.

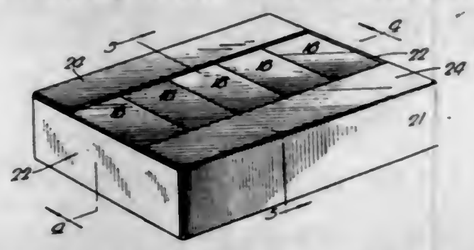


2,408,613
ELECTRICAL SYSTEM
Arthur H. Dickinson, Scarsdale, N. Y., assignor to International Business Machines Corporation, New York, N. Y., a corporation of New York
Application June 19, 1943, Serial No. 491,438
19 Claims. (Cl. 315—205)

1. An electrical system comprising a power source, parallel voltage dividers connected thereto, a gas-filled electron tube including anode, cathode, and grid electrodes and having the anode and cathode connected to points of two said dividers to bridge them conductively when ignited, said points being so chosen that cathode

potential is lower than anode potential and higher than grid potential, said tube being ignited upon a reduction in potential difference between cathode and grid and upon such ignition reducing the anode potential and increasing the cathode potential, and means responsive to an electrical pulse for further reducing the potential at the anode-connected point to such extent as to deprive the anode of the potential required to maintain the tube ignited, whereupon the tube is extinguished.

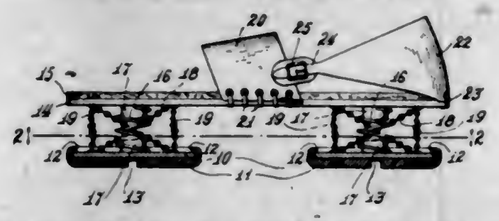
2,408,614
SURFACE COATING APPARATUS
Glenn L. Dimmick, Indianapolis, Ind., assignor to Radio Corporation of America, a corporation of Delaware
Application July 18, 1944, Serial No. 545,475
6 Claims. (Cl. 91—12.2)



1. The combination, with means for evaporating material onto a surface of an object, of a source of heat and means for reflecting heat from said source to said surface, said source of heat and said heat-reflecting means being on the same side of said object as said surface and outside the direct path of said evaporating material to said surface.

2,408,615
CATION EXCHANGE RESINS AND PRODUCTION THEREOF
James R. Dudley, Cos Cob, Conn., assignor to American Cyanamid Company, New York, N. Y., a corporation of Maine
No Drawing. Application March 30, 1944, Serial No. 528,768
7 Claims. (Cl. 260—67)

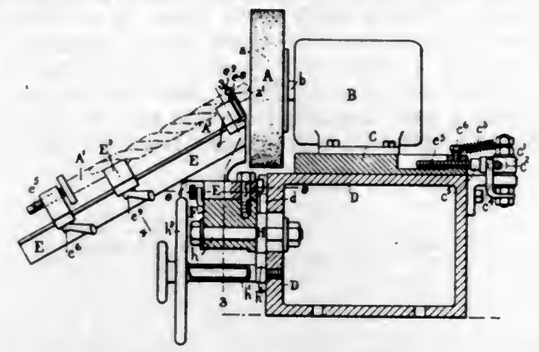
1. A granular water-soluble composition of matter comprising the hydrolyzed product of reaction of a mixture including furfural and a mineral acid halide selected from the group consisting of sulfuryl chloride and phosphorus oxychloride and having a particle size of less than about 8 mesh.



2,408,616
PACKAGING
Elmer E. Eldredge, Plymouth, Wis., assignor to Kraft Foods Company, a corporation of Delaware
Application November 24, 1941, Serial No. 420,271
1 Claim. (Cl. 206—56)

A shipping package comprising a plurality of relatively independent, substantially like package units assembled in side by side, co-planar alignment, each of said units comprising a filled fiber board box having a bottom, sides, ends, and an open top, the open tops of the boxes being disposed in the same plane, and a fiber board member having a main panel disposed across said co-planar open tops of the assembled units, side flaps extending from opposite edges of said panel and respectively folded into overlapping relation to opposite aligned ends of the units and united thereto, extensions on said flaps folded inwardly of and united to the bottoms of

said boxes, and end flaps folded into overlapping relation and united to the outer sides of the outermost unit boxes at the ends of the assemblage, the co-planar, exposed box bottoms intermediate said extensions constituting an outer surface portion of the shipping package, and said panel, side flaps, extensions and end flaps constituting other outer surface portions of the package, the fiber board in said boxes and in said member being of such character as to adapt the package to handling and shipping like a package enclosed in a conventional corrugated or like fiber board packing and shipping box.



2,408,617
FOOT APPLIANCE
Bernard Ferrar, Chicago, Ill.
Application September 30, 1943, Serial No. 504,364
3 Claims. (Cl. 36—7.8)

1. A foot appliance comprising a tread member; a foot rest arranged above and resiliently supported on said tread member; and crossed flexible tie members arranged longitudinally and laterally with their ends secured to said tread and rest members placing said resilient support under tension limiting the upward movement of said foot rest.

2,408,618
MACHINE FOR GRINDING DRILLS AND SIMILAR TOOLS
David Thomas Edward Fielding, Middleton Junction, England
Application April 13, 1945, Serial No. 588,158
In Great Britain May 15, 1944
1 Claim. (Cl. 51—219)

In a machine for grinding twist drills and similar tools of the kind referred to, the combination of a grinding wheel mounted on a horizontal shaft so that its grinding face is vertical and a frame carrying the said shaft, a bracket supporting the tool at a suitable angle to the grinding face of the wheel, a second bracket on which the tool supporting bracket is pivotally mounted so that the latter can be moved to bring the tool into various positions relative to the grinding face when grinding clearances on the cutting edge such as the cutting edge clearance and additional clearance behind the cutting edge clearance and for thinning the drill point, a third bracket on which the second bracket is mounted to pivot in a vertical plane to move the tool in an arc across the grinding face of the wheel and guides carried by the frame on which the third bracket is mounted so that it can be moved ver-

tically to adjust the height of the tool supporting bracket to suit various sizes of tools and bring the axis of the tool to be ground into the correct position in relation to the arc along which the tool is moved over the grinding face of the grinding wheel, a slide or the frame on which the grinding wheel is mounted so that its grinding face can be moved to and away from the tool, a spring tending to move the wheel in a backward direction and a cam for moving it in a forward direction against the pressure of the spring.

2,408,619
ARC WELDING ELECTRODES
Erwin Felix Friedlander, Hobart, Tasmania, Australia, assignor to O. & F. Company Proprietary Limited, Hobart, Tasmania, Australia, a corporation of Tasmania
No Drawing. Application November 10, 1943, Serial No. 509,795. In Australia November 14, 1942
4 Claims. (Cl. 219—8)

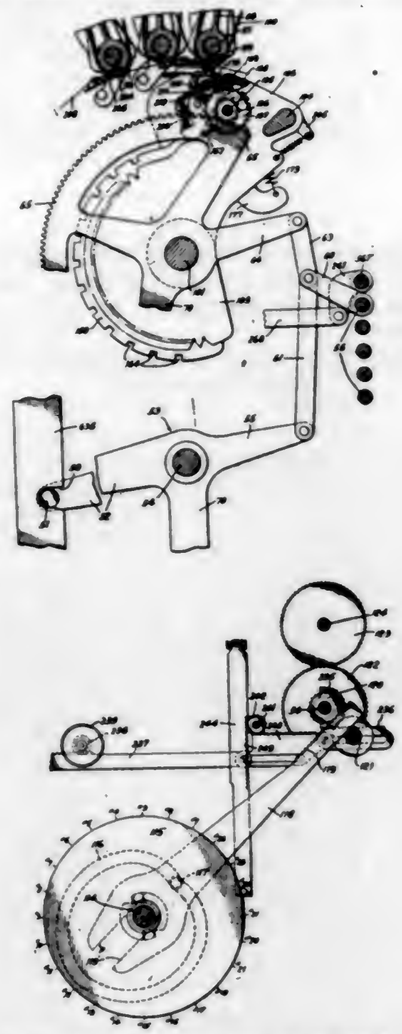
1. An arc welding electrode, consisting of a mild steel core wire of relatively low hardness and a coating to be applied to the wire consisting of tungsten metal in substantially 35% by weight, molybdenum in substantially 13.5% by weight, ferro-chromium in substantially 13% by weight, ferro-vanadium in substantially 6.5% by weight, graphite in substantially 5% by weight, calcium carbonate in substantially 5% by weight, sodium silicate in substantially 20% by weight, and cellulose.

2,408,620
ARC WELDING ELECTRODES
Erwin Felix Friedlander, Hobart, Tasmania, Australia, assignor to O. & F. Company Proprietary Limited, Hobart, Tasmania, Australia, a company of Tasmania
No Drawing. Application November 20, 1943, Serial No. 511,165. In Australia November 21, 1942
3 Claims. (Cl. 219—8)

1. An arc welding electrode for welding chromium or austenitic chromium-nickel alloy steels, such as stainless steels and the like, comprising a core wire of steel of low carbon content having a heavy coating of a diameter at least 1.5 times the diameter of the core wire containing 15–30% nickel, 20–60% chromium, 4–10% ferro-silicon, 4–10% ferro-manganese and 3–8% ferro-molybdenum with gas forming and slag forming ingredients, the nickel and chromium combining under the heat of the arc with the metal of the core wire to deposit a chromium-nickel alloy steel and the slag forming ingredients simultaneously producing a slag which protects the molten metal while it is passing through the arc and covers the deposit until the weld has solidified.

2,408,621
PHOSPHORS AND THEIR STABILIZATION
Herman C. Froelich, Cleveland, Ohio, assignor to General Electric Company, a corporation of New York
No Drawing. Application May 14, 1942, Serial No. 442,993
9 Claims. (Cl. 117—33.5)

1. A generator of radiation consisting essentially of a thermally synthesized luminescent composition of metal silicate as matrix and manganese as an activator wherein the manganese is present only in a divalent condition activatingly combined with the silicate matrix.



3. A method of assuring maximum brightness in a fluorescent discharge lamp in which is provided a coating of a thermally synthesized luminescent composition of metal silicate as matrix and manganese in divalent condition activatingly combined with said silicate matrix, which method comprises removing from the surface of the composition uncombined and superficial manganese compound whose manganese is not held fast by the silicate matrix and which is normally present on the particles of the composition after its synthesis, the removing step comprising treating the composition with a reducing agent and acid in the presence of water to form a soluble manganese salt.

2,408,622
PRINTING MACHINE
Frederick L. Fuller, deceased, late of West Orange, N. J., by Schuyler B. Harrison, East Orange, N. J., and John G. Phillips, New York, N. Y., executors, assignors to International Business Machines Corporation, New York, N. Y., a corporation of New York
Application November 2, 1943, Serial No. 508,676
14 Claims. (Cl. 101—93)

12. A printing machine comprising a set of printing wheels, an angularly positioned frame carrying said set of printing wheels, a series of platens adapted to be successively coordinated with said printing wheels, means for effecting a printing relationship of the printing wheels and a single platen which is selected for operation by the extent of angular positioning of said frame, an operating member carried by said frame and movable therewith and actuated independently of said frame to cause the operation of said last named means, and means for actuating said member in any angular position of said frame.

14. In a machine of the class described, two sets of printing wheels, each set movable in equal steps to successive printing positions, means for effecting relative positions of one-half step apart of said sets of wheels whereby one set is at a printing position as the other set is at a one-half step away from printing position, and means for bodily moving the two sets of wheels in reverse directions to cause in one direction of movement only one set of wheels to move to successive printing positions as the other set of wheels occupies positions midway of printing po-

sitions and then cause a reverse direction of movement of said sets of wheels and concurrently effect an alternate positioning of said sets of

wheels, whereby only the set of wheels previously occupying positions midway of printing positions now has successive printing positions.

2,408,623

COATING FERROUS METALS WITH MOLTEN ALUMINUM

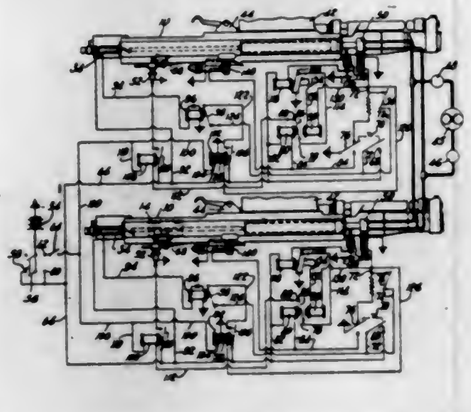
Harvey N. Gilbert, Niagara Falls, N. Y., assignor to E. I. du Pont de Nemours & Company, Wilmington, Del., a corporation of Delaware

No Drawing. Application September 7, 1942, Serial No. 457,588

4 Claims. (Cl. 117—51)

4. A process for the coating of a steel structure with aluminum which comprises pickling said structure with an acid medium to remove adhering oxide, washing the pickled article in water, and applying molten aluminum to the said surface containing substantially only water.

2,408,624



GUN CHARGER

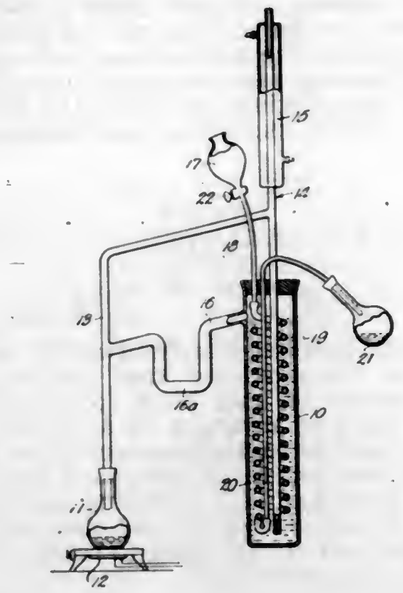
George A. Goepfrich, South Bend, Ind.

Application March 4, 1943, Serial No. 477,975

4 Claims. (Cl. 89—1)

1. In combination with a gun having a breech block reciprocable for charging the gun, a fluid pressure motor mounted on the gun and constructed and arranged to engage the breech block to move the same to a retracted position and then release it for countermovement, an electrical system comprising a first and a second circuit connected to a source of current, an electrically operated valve in the first circuit for controlling fluid to the motor and connected in the first circuit through an openable connection, a time delay relay in the first circuit constructed and arranged to respond to normal reciprocation of the breech block to open said openable connection and to respond to abnormal reciprocation of the breech block to permit closing of said openable connection, a switch in the first circuit normally open and constructed and arranged to be closed by the breech block when in a retracted position to connect the time delay relay in the first circuit, a normally open trigger switch in the second circuit, a firing mechanism in the first circuit and mounted on the gun for holding the breech block in a retracted position to be released at a predetermined time, said mechanism being connected in the first circuit through a normally open connection, a relay in the second circuit constructed and arranged to respond to closing of the trigger switch for closing said normally open connection to said mechanism to cause release of the said breech block, said relay being connected in said second circuit through an openable connection, a relay in the first circuit constructed and arranged to open said openable connection to said relay in the second circuit to prevent connecting the firing mechanism in the first circuit before the fluid in the fluid motor has been completely exhausted to allow the breech block to return to its normal firing position, and a switch in the first circuit constructed and arranged to respond to fluid pressure in the motor for connecting the last mentioned relay in the first circuit to said circuit.

2,408,625



METHOD OF SEPARATING CHLOROPHYLL FROM VITAMINS AND OTHER FAT SOLUBLE MATERIALS

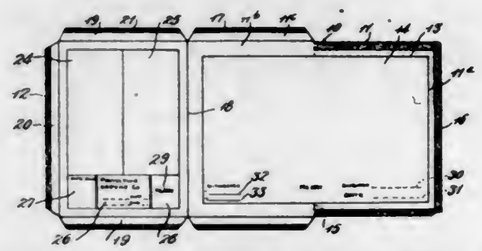
William R. Graham, Jr., Kansas City, and George O. Kohler, Mission, Kans., and Richard D. Hoover, Kansas City, Mo., assignors to American Dairies Incorporated, Kansas City, Mo., a corporation of Maryland, and The Quaker Oats Company, Chicago, Ill., a corporation of New Jersey

Application June 5, 1942, Serial No. 445,958

4 Claims. (Cl. 210—8.5)

1. A method of separating fat soluble vitamins and pro-vitamins from extraneous organic material contained in a fat solvent extract of plant materials by dialyzation utilizing a membrane capable of diffusing the vitamins and pro-vitamins, comprising the steps of passing the fat solvent mixture and a relatively uncontaminated fat solvent on opposite sides of the membrane to selectively diffuse the vitamins and pro-vitamins through the membrane into the uncontaminated

solvent, separately removing the vitamin and pro-vitamin containing solvent and the solvent containing the organic materials, and recovering the vitamins and pro-vitamins from its solvent.



2,408,626

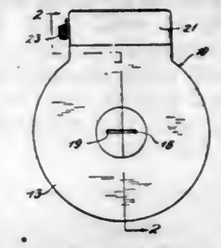
PROTECTING ORIGINATIVE MATTER

Lee B. Green, Lakewood, Ohio

Application August 28, 1943, Serial No. 500,435

8 Claims. (Cl. 283—9)

5. An invention record folder comprising a disclosure sheet and a cover sheet integrally connected therewith, said disclosure sheet having thereon an appropriately designated space for receiving a disclosure of an idea and being foldable to conceal said disclosure, means on said disclosure sheet for sealing the same in its folded condition, said cover sheet being foldable against the folded and sealed disclosure sheet, means on the cover sheet for sealing the same to the folded disclosure sheet, said cover sheet having an appropriately designated space for receiving indicia on the inner face thereof providing a record of data relating to said disclosure and being capable of being cut open to reveal said data while said disclosure sheet remains sealed, said disclosure sheet having appropriately designated spaces thereon for signatures and dates and located so that the latter spaces are in overlying relation for the folded condition of the disclosure sheet and said folded disclosure sheet having numerous perforations formed therein so as to extend through both layers thereof and distributed over said disclosure and said latter spaces to prevent alteration without detection.



2,408,627

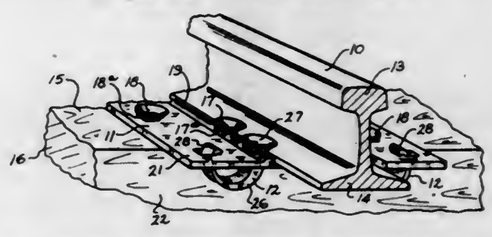
APPARATUS FOR EXTRUDING

Lee B. Green, Lakewood, Ohio

Application October 11, 1943, Serial No. 505,794

3 Claims. (Cl. 18—12)

1. In extruding apparatus, a die including a die head having an extrusion opening, means for discharging heated non-metallic thermoplastic material from said extrusion opening, and a vibration generating device attached to said die head.



2,408,628

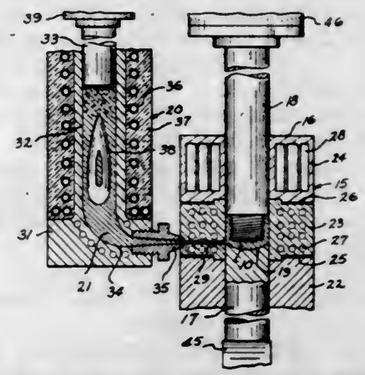
RAIL FASTENING

Lee B. Green, Lakewood, Ohio

Application October 21, 1943, Serial No. 507,117

7 Claims. (Cl. 238—321)

1. In combination with a flanged rail and a rail supporting plate having a pair of openings spaced transversely to the direction of the rail and both located on the same side of the rail flange, a rail fastener having a bowed resilient portion lying below the plate and extending away from the rail and ends extending upwardly into said openings, one of said ends having means thereon for anchoring the same in one of said openings and the other end having a holding portion thereon engaging the flange of the rail in overlying relation thereto, said fastener also having a shoulder thereon spaced from said other end so as to engage under said plate.

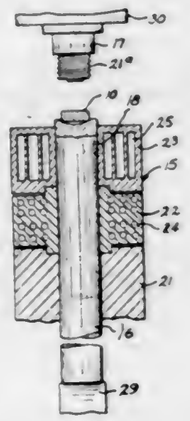


2,408,629

MOLDING APPARATUS AND METHOD

Lee B. Green, Lakewood, Ohio

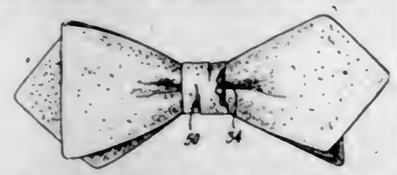
Application October 21, 1943, Serial No. 507,118



7 Claims. (Cl. 18—30)

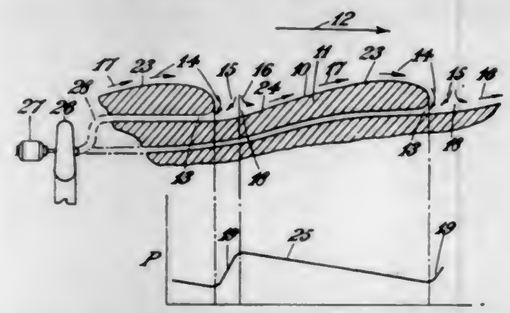
1. The method of molding articles from thermoplastic material or the like which comprises, forming a mold cavity between a pair of plungers slidable in a stationary mold body having a heated

section and a cooling section, supplying heated thermoplastic material to said cavity under pressure while the latter is in said heated section, moving said plungers first conjointly in a substantially fixed spaced relation to each other to cut off the supply of said material to the cavity and then relatively to each other to subject said material to an increased molding pressure, and then again moving said plungers conjointly in a substantially fixed spaced relation to each other to shift said cavity with the molded article therein to said cooling section.



2,408,630
APPARATUS FOR MOLDING PLASTIC MATERIAL
Lee B. Green, Lakewood, Ohio
Application October 21, 1943, Serial No. 507,119
1 Claim. (Cl. 18—17)

Molding apparatus for producing articles from thermosetting material or the like comprising, a stationary mold body having heated and cooled sections and a bore extending through said sections, a pair of opposed plungers slidable in said bore and their adjacent ends having die elements thereon corresponding in shape with the article to be molded, said adjacent ends being spaced apart and adapted to cooperate directly with each other and with the wall of said bore so as to define a mold cavity for said article in said heated section, said plungers cooperating with said bore for rapidly producing individual molded articles from said material and being relatively movable so as to open said cavity for the reception of a pill or the like of the moldable material and to subsequently close the cavity and subject said material to molding pressure therein in said heated section and said plungers being then movable conjointly in the same direction in said bore for shifting the mold cavity with the molded article therein out of said heated section and through said cooled section to the outer end of said bore so as to open said cavity for the discharge of the molded article and the reception of another pill or the like of said moldable material, and actuating devices for the respective plungers and cooperating to produce such sequential movements of the plungers.



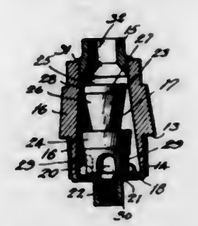
2,408,631
BOW TIE DEVICE
Max Greenfield, Brooklyn, N. Y.
Application February 28, 1945, Serial No. 580,141
11 Claims. (Cl. 2—154)

3. A bow tie device of the character described comprising, in combination, a main body member having a plate adapted to overlie the rear surface of the center constricted portion of said bow tie, a clamping member comprising bottom, top and side portions, said bottom portion being pivotally mounted on said plate adjacent the bottom edge thereof leaving said top portion free, means adjacent the top edge of said plate for releasably locking said top portion to said plate with said side portions overlying the front surface of the center constricted portions of said bow

tie, said side portions being outwardly curved to conform to the simulated knot portion of said bow tie, means on said plate for gripping one end of a band of mtaerial so as to be able to cause said band to encircle said constricted center portion of said bow tie to simulate a knot and to hide said plate and said clamping member from view, and means carried by said plate for clamping the free end of said band to retain the same in its encircled position.

2,408,632
FLUID-SOLID CONTACT SURFACE
Alan Arnold Griffith, Derby, England, assignor to Rolls-Royce Limited, Derby, England, a company of Great Britain
Application August 12, 1943, Serial No. 498,414
In Great Britain August 25, 1942
5 Claims. (Cl. 244—40)

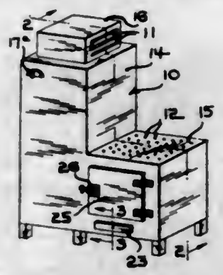
1. A solid having a surface over which fluid flows, which is provided with at least one suction slot and which surface is convex to the fluid upstream of the slot and is concave to the fluid downstream of the slot with the greatest arithmetical curvature at the slot in each case, and means for sucking some of the fluid through the slot.



2,408,633
PRODUCTION OF SUBSTITUTED QUINAZOLONES FROM ORGANIC PHOSPHAZO COMPOUNDS
Alfred Guenther, Riegelsville, Pa., and Jack F. Morgan, Phillipsburg, N. J., assignors to General Aniline & Film Corporation, New York, N. Y., a corporation of Delaware
No Drawing. Application April 7, 1945, Serial No. 587,213
10 Claims. (Cl. 260—251)

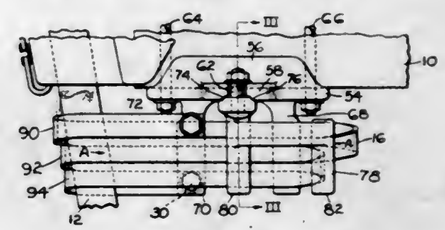
1. The process of producing substituted quinazolones which comprises heating an organic phosphazo compound having the general formula

$$(R—N=P—NHR)_n$$



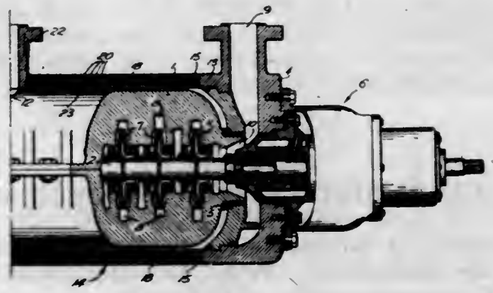
wherein n is selected from the class consisting of 1 and 2, and R is selected from the class consisting of an aliphatic chain, an alicyclic nucleus, an aromatic nucleus and a heterocyclic nucleus and is free from nitro and carbonyl groups in o- and p-position to its linkage to the remainder of the molecule with an N-acyl-o-aminocyclic carboxylic acid selected from the class consisting of aromatic and heterocyclic carboxylic acids in the presence of an inert, normally liquid organic solvent.

2,408,634
BOTTLE CLOSURE TO RENDER BOTTLES NONREFILLABLE
Harry W. Hagen, Decatur, Ill.
Application May 1, 1944, Serial No. 533,483
11 Claims. (Cl. 215—25)



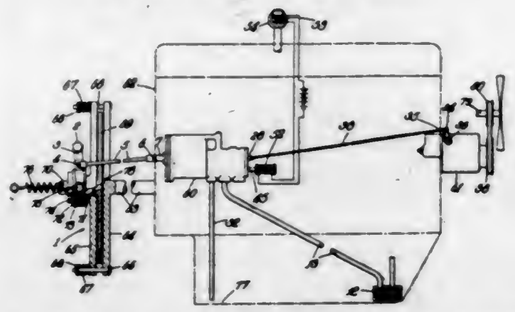
11. A bottle closure comprising a hollow body portion provided at its lower end with a plurality of valve-sealable openings, a core member positioned interiorly within said body portion and spaced therefrom so as to provide a path for fluids, said core portion being provided at its lower end with a plurality of recesses adapted to guide freely movable valve-members capable of obturating said openings but limited as to their movement by the space between said recesses and the interior surface of the body portion.

2,408,635
ICE AIR CONDITIONING SYSTEM
John M. Hall, New York, N. Y.
Application April 5, 1945, Serial No. 586,664
4 Claims. (Cl. 62—133)



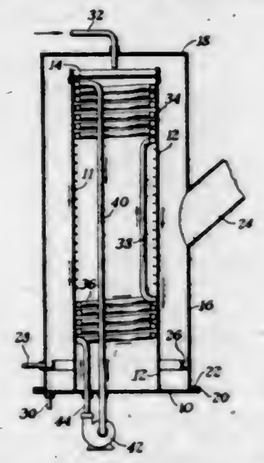
1. An air conditioning system, comprising a box-like substantially L-shaped housing presenting connecting vertical and horizontal chambers, the vertical chamber being larger than said horizontal chamber and extending thereabove to provide an air intake column, an air inlet at the top of the vertical portion and an air discharge at the top of the horizontal portion, a fan in the top of said vertical portion for forcing air downwardly therethrough to circulate air through said housing, a support within said housing for a cake of ice, a door in said housing to make said support accessible, a drain beneath said support, a tray for said drain to discharge into, and baffle plates movably mounted in said housing for directing the air stream against said cake of ice.

2,408,636
PICKER STICK CHECKING MECHANISM
Wallace Hamilton, Albany, N. Y., assignor to Draper Corporation, Hopedale, Mass., a corporation of Maine
Refiled for abandoned application Serial No. 535,420, May 13, 1944. This application May 31, 1945, Serial No. 596,832
6 Claims. (Cl. 139—165)



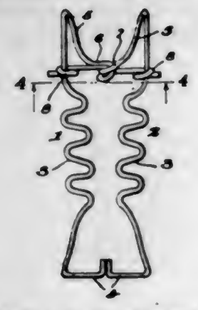
1. A check for a picker stick including front and rear brackets fixed to a lay and having depending friction fingers, and a flexible strap fixed at each end to said brackets and helically threaded between said fingers to form a plurality of loops arranged to be progressively engaged by the picker stick as it approaches each limit of movement to check said stick.

2,408,637
DOUBLE-CASING HIGH-PRESSURE PUMP
Edward Hart, San Marino, Calif., assignor to A. O. Smith Corporation, Milwaukee, Wis., a corporation of New York
Application July 31, 1944, Serial No. 547,423
2 Claims. (Cl. 103—108)



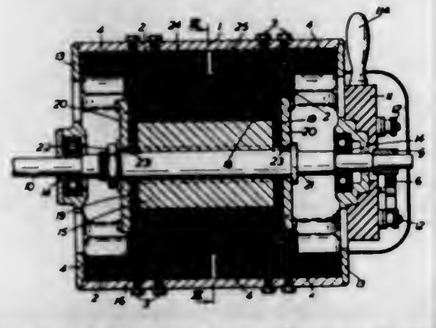
1. In a double casing high pressure pump of the class described, an outer cylindrical casing constructed of a plurality of superimposed layers of rolled metal plate welded in close pressure engagement with one another for withstanding high internal fluid pressures, a lateral intake head welded to said casing at one end and a flange welded to the casing at the other end, an end head secured to said flange, aligned bearings carried by said heads for a pump shaft, a pump enclosed in said casing and having a rotary shaft extending therethrough and mounted in said end bearings, a plurality of impellers mounted on said shaft and operative in series to provide a high pressure discharge for the pumped fluid, said pump being supported at its ends only by said end heads and being continuously and radially spaced from said outer casing to provide a closed chamber therebetween for substantially the full length of the pump, and a lateral discharge outlet welded to said casing substantially centrally thereof in alignment with the discharge port of the pump and connecting with the space between said pump and casing to dispose fluid in said space under circumferential and longitudinal pressure protecting the pump against internal fluid pressures during operation of the pump.

2,408,638
APPARATUS FOR CONTROLLING POWER TRANSMISSION SYSTEMS
Stanley Hedgecock, Wood Green, London, England, assignor to Laystall Engineering Company Limited, London, England, a British company
Application July 7, 1943, Serial No. 493,780
In Great Britain July 20, 1942
6 Claims. (Cl. 192—3.5)



1. In a power transmission system, a power unit, a rotary element driven thereby, an element adapted to engage said rotary element frictionally, pressure-actuated means including a piston for operating said engaging element, means for continuously forcing fluid under pressure to said piston, a slide valve assembly interposed between said fluid-forcing means and said piston for controlling the application of fluid pressure to said piston, said assembly comprising a casing, a ported sleeve slidable in said casing and fixed to said piston and a valve rod, and means responsive to the speed of said power unit and operatively connected to said valve rod for actuating said assembly to cut off the pressure from operating means below a predetermined speed of said power unit and to allow the pressure to be directly applied to said piston on said predetermined speed being exceeded.

2,408,639
VACUUM DISTILLATION PROCESS AND APPARATUS
Kenneth C. D. Hickman, Rochester, N. Y., assignor to Distillation Products, Inc., Rochester, N. Y., a corporation of Delaware
Application June 20, 1944, Serial No. 541,253
11 Claims. (Cl. 202—52)

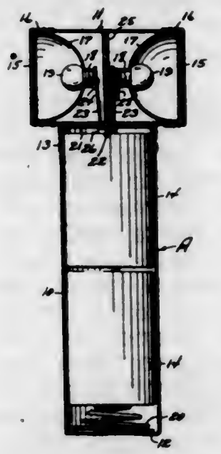


1. High-vacuum distillation apparatus comprising in combination a vaporizing surface, a condensing surface, means for heating the vaporizing surface, means for distributing distilland onto the vaporizing surface in a thin film, means for removing undistilled residue from the vaporizing surface, means for recovering heat from the undistilled residue while it remains in the form of a thin film in the still, means for transferring this recovered heat to the incoming distilland while it is in the still, while it is in the form of a thin film and immediately previous to its passage onto the vaporizing surface, and means for removing condensate from the condensing surface.

2,408,640
COMBINED BOOTJACK AND BOOT HOOK
Charles G. Hilton, Amarillo, Tex.
Application August 12, 1943, Serial No. 498,349
4 Claims. (Cl. 223—115)

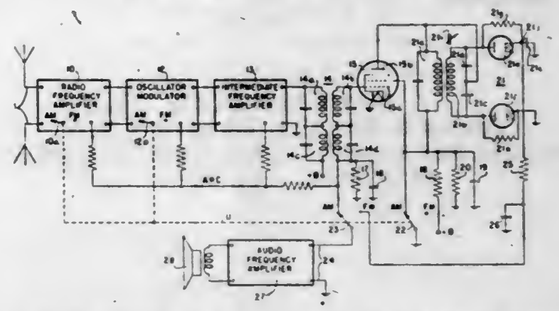
1. A combined boot jack and boot hook comprising a pair of elongated members arranged in side-by-side relation and having in-turned hooks forming a relatively flat keel rest at one end, means for detachably connecting said members together, and yoke arms on the respective members at the other end thereof coacting to form a yoke to receive a boot heel, and a pair of legs projecting at an angle from said members and converging toward each other at the outer ends of said legs.

2,408,641
DYNAMOELECTRIC MACHINE
Stanley Isaiah Hitchcock, London, England, assignor to Tropical Plantations Limited, London, England, a British company
Application March 6, 1944, Serial No. 525,226
In Great Britain April 20, 1943
7 Claims. (Cl. 171—209)



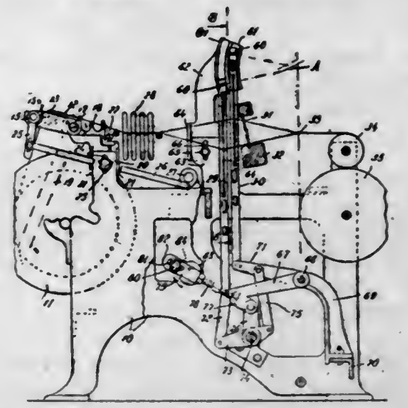
1. In an electromotive structure including a rotor incorporating a cylindrical permanent magnet having circumferentially spaced pole pieces at its opposite ends and a stator comprising circumferentially spaced complementary pole pieces and wound cores for energizing the same, the improvement that comprises a first series of laminations of a material of low reluctance extending between the pole pieces at opposite ends of said rotor, a second series of laminations extending between the pole pieces of said stator, the laminations of the first and second series defining therebetween an air gap, and intervening spacing members of non-magnetic material subdividing both series of laminations, the spacing members of the first series being staggered with respect to those of the second whereby a sinuous flux path between rotor and stator is provided while the pole pieces are in registry and a flux leakage path of medium reluctance is provided between the pole pieces.

2,408,642
SPARKING PLUG
Bernard Hopps and Colin James Smithells, Rugby, England, assignors to Lodge Plugs Limited, Rugby, England
Application February 15, 1943, Serial No. 475,980
In Great Britain March 28, 1942
1 Claim. (Cl. 123—169)



For use in a sparking plug of the kind specified, the combination of a central electrode in the form of a metal core having at one of its ends a firing tip of reduced diameter, a ceramic insulator having a longitudinal bore through which the electrode passes and which is reduced at the end adjacent to the firing tip, and a seal of vitreous material arranged between the electrode and insulator at the inner end of the firing tip to prevent products of combustion from coming into contact with any part of the electrode other than the firing tip, the seal being resistant to the action of such products.

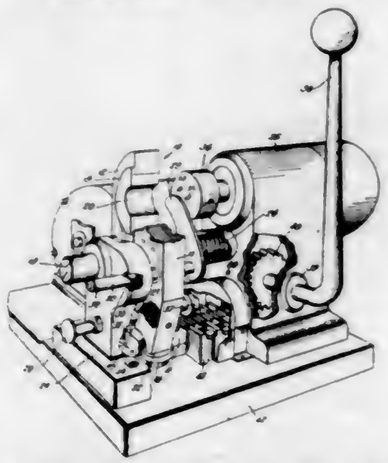
2,408,643
SAFETY FLASHLIGHT FOR PEDESTRIANS AND BICYCLE RIDERS
Joseph A. Hoy, Hialeah, Fla.
Application June 28, 1944, Serial No. 542,469
2 Claims. (Cl. 240—10.67)



1. A flash-light of the kind described, comprising a battery case for housing an electric battery, a lamp head extending at right angles to the case and having a nipple connection with the said case, lenses in opposite ends of the head, reflectors within the head and confronting the lenses, electric light bulbs carried by the reflectors, a single U-shaped contact having the arms thereof contacting the button contacts of the bulbs and the base thereof contacting the contact button of the battery within the case, and control switches at opposite sides of the head for selectively disengaging the single contact from the bulbs.

2,408,644
COMBINED AMPLITUDE-MODULATION AND FREQUENCY - MODULATION RECEIVER STAGE
John W. Huff, Chicago, Ill., assignor, by mesne assignments, to Belmont Radio Corporation, Chicago, Ill., a corporation of Illinois
Application July 24, 1944, Serial No. 546,298
7 Claims. (Cl. 250—20)

1. In a wave-signal receiver adapted selectively to receive amplitude-modulated signals or frequency-modulated signals, a dual-purpose signal-translating stage comprising, a vacuum tube having a plurality of electrodes including a signal input electrode and a signal output electrode, an input circuit for applying received signals to said input electrode, a frequency discriminator coupled to said output electrode, a signal-frequency output circuit, circuit connections for said tube electrodes to cause said tube to operate as a diode amplitude-modulation detector, circuit connections for said tube electrodes to cause said tube to operate as a frequency-modulation limiter, and switch means operable in a first position to establish said first-named circuit connections and to connect said output circuit to said amplitude-modulation detector circuit and operable in a second position to establish said second-named circuit connections and to connect said output circuit to said discriminator.

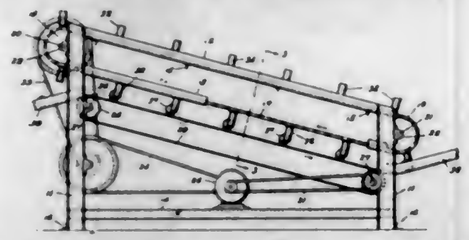


2,408,645
LOOM
John O. Hunt, Greenville, S. C., assignor to Mountain City Foundry and Machine Co., Greenville, S. C., a corporation of South Carolina
Application June 24, 1944, Serial No. 541,893
4 Claims. (Cl. 139—55)

1. In a loom for weaving fabric, the combination of a pair of heddle frames provided with eyes through which warp threads pass, the frames being reciprocable in opposite directions from a level position, pivoted arms connected at their free ends to the lower ends of the frames, the pivots of the arms lying in a plane through the fell of the fabric and at right angles to the warp

threads when the frames are level, means for oscillating the arms in opposite directions about their pivots to reciprocate the frames, guides at the upper ends of the frames having guideways of the form of arcs of circles about a center in said plane, and elements on the frames entering the guideways, said guides cooperating with the arms to cause the frames to have a broadside movement as the frames are moved up and down by the arms.

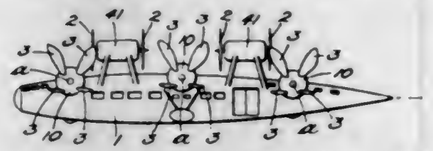
2,408,646
MACHINE TOOL
James R. Huntley, Hicksville, N. Y.
Application August 2, 1945, Serial No. 608,535
11 Claims. (Cl. 90—21)



1. In a machine of the character described, the combination comprising a tool; a work clamp for movement toward and away from said tool and movable to and from work to be clamped thereby; an operating member having a portion movable toward said tool, said portion engaging the work clamp, relative movement between said portion and work clamp toward the tool causing work engaging movement of the clamp and after said work engagement, movement of the clamped work toward the tool; and yieldable means to restrain movement of said clamp relative to said tool until said work has been firmly clamped.

2,408,647
MANUFACTURE OF HYDRATED LIME
Harry N. Huntzicker, Evanston, and Charles Robert Norman, Jr., Chicago, Ill., assignors to United States Gypsum Company, Chicago, Ill., a corporation of Illinois
No Drawing. Application March 13, 1941, Serial No. 383,170
8 Claims. (Cl. 23—188)

1. Process of producing plastic hydrated lime which comprises burning raw limestone in the form of pieces of fairly widely varying sizes under conditions sufficiently drastic to burn all of said limestone pieces to a condition of absence of unburnt core, thereby also producing some overburnt lime, hydrating the thus produced lime mixture under superatmospheric pressure to insure its substantially complete hydration, reducing the free moisture content of the product thus produced to below 1%, thereby producing a hydrated lime product in the form of a very fine substantially dry powder, and then agglomerating the particles of said powder into aggregations not substantially exceeding 30 mesh in size by ball milling said substantially dry powder with steel balls varying in size within the range of from about ¼" to 1" in diameter.



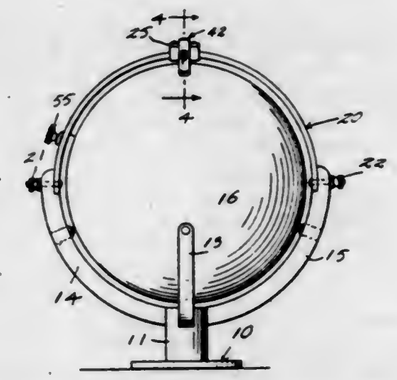
7. Process of producing a plastic hydrated lime which comprises ball-milling hydrated lime in a tube mill with balls whose diameter lies within the range of from about ¼ inch to about 1 inch, so as to re-aggregate lime particles of smaller size into aggregations of larger size.

2,408,648
APPARATUS FOR CLEANING EGGS AND THE LIKE
Clark H. Inman, Lakewood, N. J.
Application August 29, 1945, Serial No. 613,245
10 Claims. (Cl. 51—138)

1. In apparatus for cleaning eggs and the like, an egg-supporting element having an abrasive surface for engagement with the eggs; pocket members for cradling and advancing the individual eggs over said surface, said pocket members also having an abrasive surface engageable with the eggs; and means for moving the pocket members relative to the supporting element.

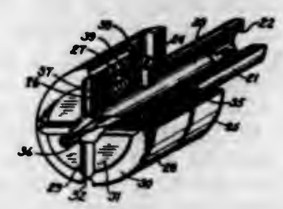
2,408,649
AIRCRAFT HAVING MOVING AIRFOIL OR WING
Arthur Rex Jackson, Mill Hill, England
Application May 19, 1944, Serial No. 536,364
In Great Britain May 3, 1943
16 Claims. (Cl. 244—21)

1. In an aircraft, in combination, means for propelling the aircraft, a plurality of wings for maintaining the aircraft airborne, means for mounting each wing for oscillation about an axis transverse to the aircraft and for rotation about another axis transverse to the aircraft, coupling means interconnecting said wings to cause rotation thereof in unison, transmission means correlating the rotary and oscillatory movement of each wing in such manner that the reaction of the air against the same resulting from movement of the aircraft caused by said propelling means effects both rotary and oscillatory movement thereof, each wing being inclined to its path of progression in space to exert an upward thrust on the aircraft to keep it airborne, and means for adjusting said transmission means to vary the inclination of the wing operated thereby to its path of progression, whereby the upward thrust applied thereby to the aircraft is variable.



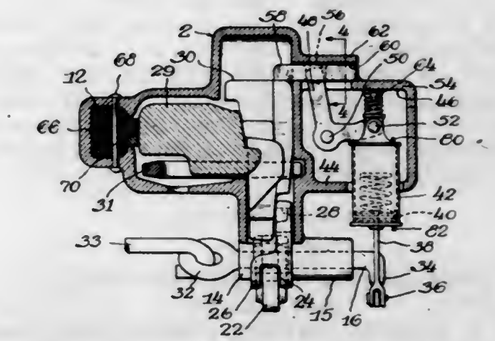
2,408,650
WATER-RESISTANT SHOE
George Hollis Jennings, Cincinnati, Ohio
Application March 30, 1945, Serial No. 585,649
3 Claims. (Cl. 36—78)

1. A calk welt for shoes formed of a strip folded around an oil absorbent body to form a bead, with the remainder of the strip serving as a fin for mounting in a shoe, and a series of holes



formed in that portion of the strip which surrounds the oil absorbent body.

2,408,651
WORLD GLOBE AND SCALE
Ralph A. Kiehl, San Diego, Calif.
Application November 10, 1944, Serial No. 562,810
6 Claims. (Cl. 35—46)



1. A globe and support therefor comprising a base, a standard rising from said base, radially arranged upwardly directed arcuate arms carried by said base, a globe rotatably seated in the concave sides of said arms and having universal movement, a substantially semi-circular combined globe retainer and guide bar rockably carried by an opposed pair of said arms, a slide member slidably carried by said bar, and spring-pressed brake means carried by said bar for holding said globe against rotation.

2,408,652
CENTER DRILL CHUCK
Benjamin F. King, Endicott, N. Y., assignor to International Business Machines Corporation, New York, N. Y., a corporation of New York
Application July 11, 1944, Serial No. 544,400
3 Claims. (Cl. 77—66)

1. In a cutting device for a work rotating machine, a tool holder, a shoulder on said tool holder, a reduced end portion on said tool holder, a circular ball bearing forced on said end portion, a stop collar on said bearing to turn with respect to said holder, and a washer between said shoulder and said bearing, said shoulder being formed with openings through which said washer may be struck to push the bearing and collar off said tool holder.

2,408,653
COUPLER
Edmund P. Kinne, Alliance, Ohio, assignor to American Steel Foundries, Chicago, Ill., a corporation of New Jersey
Application July 30, 1943, Serial No. 496,802
43 Claims. (Cl. 213—153)

1. In a coupler, a pivoted knuckle, a lock presenting flat bearing surfaces for compression between said knuckle and a wall on said coupler, depending trunnion lugs on said coupler, a rotor pivoted from said lugs, a lifter arm interlocked with said rotor, a link pivoted to said arm and said lock, a lever fixed to said rotor, a bell crank pocket on the guard arm side of said coupler, a bell crank pivoted within said pocket, a slot through said coupler above said pocket and partly defined by the top wall thereof, an opening through said wall communicating with said slot, a slidable anticreep member mounted in said slot for movement into and out of locking engagement with said lock, the upper end of said bell crank extending through said opening for connection to said member, a slot in the bottom wall of said pocket, a double-acting power cylinder device movably positioned within said last-mentioned slot, said device being connected at opposite ends thereof to said lever and said bell crank, and resilient means bearing against the upper end of said device and against said top wall.

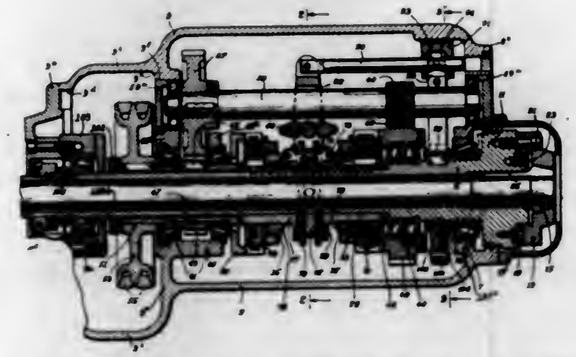
2,408,654
SILICIC ACID SOLS
Joseph S. Kirk, Seven Hills Village, Ohio, assignor to E. I. du Pont de Nemours & Company, Wilmington, Del., a corporation of Delaware
No Drawing. Application April 18, 1942, Serial No. 439,547
5 Claims. (Cl. 252—309)

1. In a process for the preparation of a silicic acid sol the steps comprising mixing with agitation an aqueous silicic acid sol which does not exhibit evidence of gelling and an organic hydrogen bonding donor compound which contains at least one oxygen atom bonded to a carbon atom, is selected from the group consisting of ethers in which the carbon atoms attached to the ether oxygen are not attached to each other, amides, and ketones, is soluble in water to the extent of at least one half per cent by weight, and which does not form a precipitate with soluble silicic acid, dissolving in the mixture a salt chemically non-reactive with the hydrogen bonding donor compound or the silicic acid, the pH of the solution being such that the corresponding metal silicate is not formed, and thereby salting out the hydrogen bonding donor compound together with the silicic acid to form two liquid phases, one of which contains the material salted out and the other water and salt, and separating the silicic acid phase from the water and salt.

2,408,655
SILICIC ACID COMPOSITIONS
Ralph K. Iler, Cleveland Heights, and Joseph S. Kirk, Seven Hills Village, Ohio, assignors to E. I. du Pont de Nemours & Company, Wilmington, Del., a corporation of Delaware
No Drawing. Application April 18, 1942, Serial No. 439,548
3 Claims. (Cl. 252—309)

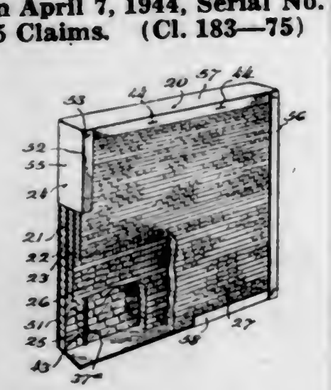
1. In a process for improving the stability against jelling of a polysilicic acid solution the steps comprising mixing together an aqueous polysilicic acid solution and a trialkyl ester of phosphoric acid in which the alkyl group contains less than five carbon atoms, and removing water from the mixture.

2,408,656
PROCESS FOR PRODUCING SILICIC ACID SOLS
Joseph S. Kirk, Seven Hills Village, Ohio, assignor to E. I. du Pont de Nemours & Company, Wilmington, Del., a corporation of Delaware
No Drawing. Application April 27, 1943, Serial No. 484,768
6 Claims. (Cl. 252—309)



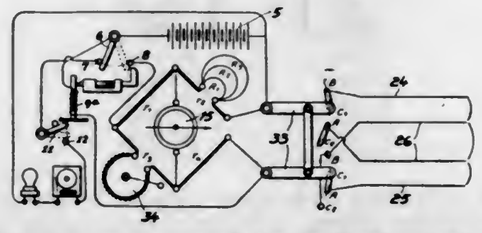
4. In a process for producing a liquid alcohol-polysilicic acid hydrogen-bonded complex having a pH below about 3.0 and containing not more than about 20 per cent by weight of water, the steps comprising mixing an aqueous polysilicic acid solution exhibiting no evidence of gelling and having a pH below about 3.0, and a liquid alcohol having at least two carbon atoms per hydroxyl group, the amount of alcohol used being not more than the amount which permits a water-soluble salt to dissolve in the solution and not less than the amount which, when the solution is saturated by dissolving such a salt, causes formation of a separate, alcohol-rich polysilicic acid-containing phase distinct from the remainder of the solution, whereby an alcohol-polysilicic acid hydrogen-bonded complex is formed in solution, salting out the hydrogen-bonded complex to form a separate phase by adding a salt which is non-reactive with the alcohol and the silicic acid, the pH being such that the metal silicate corresponding to the salt is not formed, and separating the salted-out phase from the remainder of the solution.

2,408,657
HAIR CURLER
Rudolf Krasberg, Chicago, Ill.
Application April 20, 1944, Serial No. 531,876
8 Claims. (Cl. 132—34)



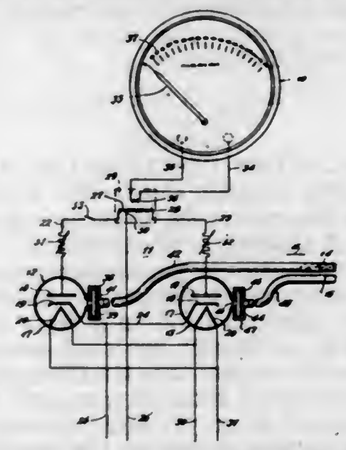
8. A hair curler comprising a hollow bar on which a strand of hair is to be wound, said bar having an extension portion beyond the portion on which the strand is wound a demountable wire locking member adapted to maintain the strand in wound condition comprising a wire arm portion spaced from the surface of said bar to overlie the curl and a resilient coil spring portion mounted on the exterior of an extension of said bar so as to have inherent rotation resisting relation therewith.

2,408,658
TURRET LATHE HEADSTOCK
Robert Kurzweil, Kew Gardens, N. Y., assignor to Morey Machinery Co., Inc., Astoria, Long Island, N. Y., a corporation of New York
Application May 5, 1943, Serial No. 485,955
20 Claims. (Cl. 82—28)



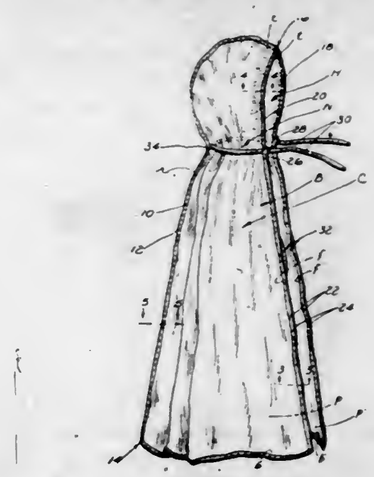
1. In a headstock, a housing, a pair of spaced bearings in the housing, a spindle journalled within said bearings, a sleeve telescoped on said spindle, bearings in said housing to support said sleeve, means to clutch said sleeve to said spindle, a bearing on said spindle, a gear on said last named bearing, a back shaft parallel to the spindle and journalled within said housing, a gear on said sleeve, gears on said shaft meshing respectively with the gear on said bearing and the gear on said sleeve, and means to clutch the gear on said bearing, to said spindle, said sleeve, clutch means and bearing on the spindle being located between the first named pair of bearings.

2,408,659
AIR FILTER
Charles G. Lamb, Elmhurst, Ill.
Application April 7, 1944, Serial No. 529,909
15 Claims. (Cl. 183—75)



1. A replaceable filter cell for air filters, comprising a plurality of narrow strips of single face corrugated paper arranged in a stack, with the liners of one strip engaging the corrugations of the next, but unattached thereto, and a supporting frame for maintaining said strips in a unit, comprising a pair of end frame members, one at each end of the stack, and a plurality of transverse frame members secured to said end frame members and engaging said corrugated strips to hold them in a unitary assembly and means for impregnating said filter cell and providing its external surface with a tacky material, comprising a sprayed and absorbed supply of adhesive compound, said transverse frame members being located in slots in the corrugated strips and being in frictional engagement with the said corrugated strips at the walls of said slots, the said transverse frame members extending from the face of the filter cell from said slots for the purpose of engaging additional filter cells and spacing the present filter cell from additional filter cells to provide a dead air space between this cell and adjacent cells.

2,408,660
REMOTE INDICATION SYSTEM
Birger Adolf Lannge, Rasunda, Sweden
Application May 25, 1943, Serial No. 488,393
In Sweden February 15, 1943
5 Claims. (Cl. 177—311)



1. In an arrangement for indicating at a control station the occurrence, at any one of a plurality of remote locations, of a predetermined physical condition, the combination of an alarm mechanism at said control station including a relay, an alarm device, an energizing circuit for said alarm device including a back contact of said relay, and means operative upon release of said relay for locking said back contact in closed position, a source of current connected in series with said relay, a contact device at each location including a normally closed contact adapted to open upon occurrence of said predetermined physical condition at its location and a normally open contact adapted to close shortly after the opening of the associated normally closed contact, said normally closed contacts being connected in series across said source of current and relay to keep the latter normally energized, circuits connecting said normally open contacts parallel to each other across said relay and source of current, each of said circuits having a predetermined resistance different from those of all the other parallel circuits, a normally open shunt across said relay, an electrical measuring instrument in said shunt, and an operator controlled switch to close said shunt.

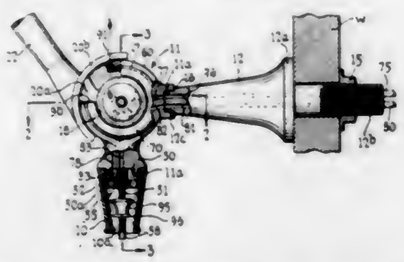
2,408,661
AIR-SPEED INDICATOR
Asa Ben Lee, Cleveland, Ohio, assignor to Designers for Industry, Inc., Cleveland, Ohio, a corporation of Ohio
Application November 20, 1943, Serial No. 511,167
5 Claims. (Cl. 73—212)

1. An indicator of the character described comprising a plurality of electron tubes having output circuits connected in parallel, each of said electron tubes having gas sealed therein and the electrical output of each electron tube being variable in accordance with changes in the gas pressure therein, a Pitot tube located to be acted upon by a fluid stream, fluid impulse conducting means connecting said Pitot tube with one of said electron tubes so that velocity changes in said stream will produce corresponding variations in the gas pressure in said one electron tube, a static tube, fluid impulse conducting means connecting said static tube with another of said electron tubes for varying the gas pressure therein in accordance with changes in the static pressure of said fluid, and a meter electrically connected with said output circuits.

2,408,662
RAIN PROTECTIVE GARMENT
Benjamin A. Levitt, Newark, N. J., assignor to A. L. Siegel Co. Inc., New York, N. Y., a corporation of New York
Application September 5, 1945, Serial No. 614,491
4 Claims. (Cl. 2—84)

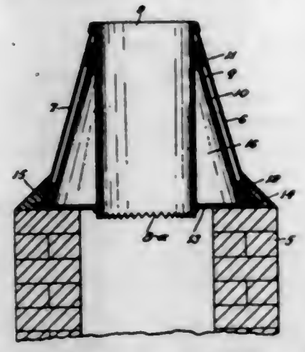
1. A rain protective garment comprising a body made of waterproof sheet material, said body consisting of two similarly dimensioned sheet patterns, one superimposed on the other, defining in the garment assembly a hood section and a cape section, the region between the hood section and the cape section defining the neck of the garment, each sheet pattern having a bottom edge, a rear edge and a front edge, the rear and front edges converging and merging at the top, the two sheet patterns being united together along their rear edges by a binding stitched thereto, the front edges at the hood section of the garment having an elastic binding stitched thereto and thereby producing a cupped and head fitting hood, the front edges together with the bottom edges at the cape section having a binding stitched therealong, and a tie string attached to the neck of the garment forming a neckband.

2,408,663
STUD OR PROTECTOR FOR BOOTS AND SHOES
William Howell Lewis, Cwmllynfell, Swansea, South Wales
Application September 6, 1945, Serial No. 614,702
In Great Britain July 17, 1945
2 Claims. (Cl. 36—75)



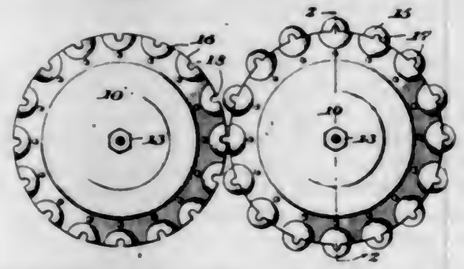
1. A stud or protector for boots and shoes comprising a block shaped to form an outer portion of a sector of a circle, namely a sector truncated by a transverse straight line, said block

having on its underside and extending the length thereof a channel-section groove the inner faces of the walls of which are inclined to form sharp edges in conjunction with the external side faces



of the block, and a conical hole in the centre of the block for screw reception, the straight side wall of the block being formed with sharp prongs and the curved side wall being uninterrupted from end to end.

2,408,664
MIXING FAUCET FOR BEVERAGES
Charles William Lloyd, Brooklyn, N. Y., assignor to Ginger-Cola Dispenser, Inc., Brooklyn, N. Y., a corporation of New York
Application May 17, 1945, Serial No. 594,197
6 Claims. (Cl. 225—26)

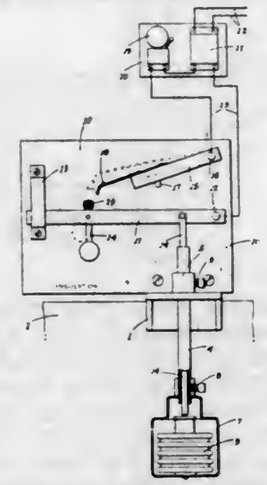


1. In a beverage dispensing device of the character described a faucet comprising an inlet member, a nozzle portion having a discharge orifice and a valve body interconnecting said inlet member and said nozzle, a shutter valve rotatably mounted in said valve body and adapted to be moved to open or closed position, said shutter valve having a first inlet port, a first outlet port and a first passageway interconnecting said first inlet and outlet ports, a second inlet port, a second outlet port and a second passageway interconnecting said second inlet and outlet ports, said passageways being disposed in different planes in the shutter valve a first passageway in said inlet member for the feeding of charged water under pressure directly from its source, said last named first passageway communicating directly with said first inlet port when the said shutter valve is in open position, a second passageway in said inlet member for feeding syrup under pressure directly from its source, said last named second passageway communicating directly with said second inlet port when said shutter valve is in open position, a first passageway in said nozzle portion communicating directly with said first outlet port and said discharge orifice when said shutter valve is in open position, and a second passageway in said nozzle portion communicating directly with said second outlet port and with said discharge orifice when said shutter valve is in open position whereby charged water and syrup may flow simultaneously into a tumbler directly from their independent sources through said discharge orifice, and means for selectively moving said shutter valve to open or closed position.

2,408,665
CHIMNEY TOP
Elmer R. Lovely, Glastonbury, Conn.
Application November 15, 1943, Serial No. 510,317
8 Claims. (Cl. 98—67)

1. A chimney top attachment comprising a tapered outer casing, a tapered inner shell spaced from said casing to provide an insulating space therebetween, a bottom plate extending across the bottom of said outer casing and sealed to the edge thereof, and a tube extending through, and in sealing engagement with, said bottom plate and the tops of said shell and casing.

2,408,666
ANTIFRICTION GEARING
Logan L. Mallard, Norfolk, Va.
Application August 20, 1943, Serial No. 499,401
7 Claims. (Cl. 74—464)

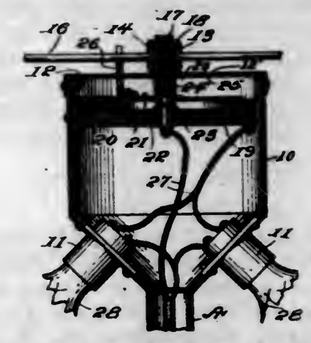


1. Anti-friction gearing including a pair of coacting transmission members, one of which is formed with bearing recesses on the periphery thereof and a series of rotatable anti-frictional elements disposed in said recesses and the other of which is provided with a series of recesses in its periphery adapted to receive said bearing elements when the transmission members are in motion, and resilient retainer members projecting radially from said first-named transmission member and engaging said anti-frictional elements in the transverse axial regions thereof to detachably maintain the latter in the bearing recesses provided therefor.

2,408,667
THERMOSTAT CONTROLLED ALARM
Philip Martin, Camarillo, Calif.
Application November 30, 1943, Serial No. 512,300
6 Claims. (Cl. 177—311)

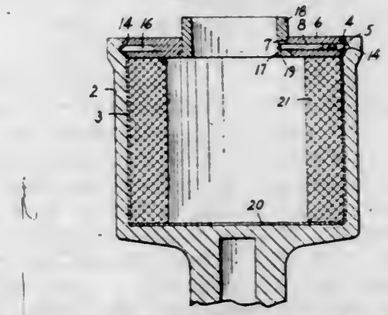
3. A thermostatic alarm device comprising an expansible thermostat, means to mount the thermostat in a fixed position in a zone of heat, an electric alarm, a circuit for said alarm, an upstanding panel above the thermostat mounted with the thermostat mounting means, a substantially horizontal lever pivoted adjacent one end of the panel, a bar pivoted on the panel and overhanging the lever, the bar and lever being insulated from each other and separately connected

to the circuit to form a switch therein, a finger projecting from the free end of the bar, means normally supporting the bar against downward tilting movement beyond a predetermined position, the finger being then spaced from the lever when the latter is in its normal position, and means between the thermostat and lever to swing the latter upwardly upon expansion of the thermostat whereby the lever will engage the finger and the circuit will be closed, and manually operable means on the lever to support the finger clear of and in insulated relation to the lever upon first lifting the finger from contact with the bar and allowing the bar and finger to reassume their normal relationship to the lever upon a lowering movement of the latter to normal.



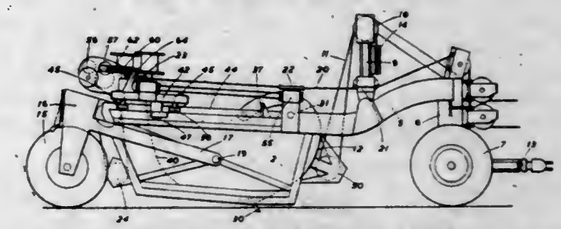
2,408,668
ELECTROLYSIS OF COPPER
William Clark Mason, Inspiration, Ariz., assignor to Inspiration Consolidated Copper Company, a corporation of Maine
No Drawing. Application May 27, 1943, Serial No. 488,745
1 Claim. (Cl. 204—108)

In a process for the production of electrolytic copper cathodes involving electrolytic precipitation of copper from a sulphuric-acid-containing electrolyte, the improvement which comprises inhibiting the formation of sprouts on the cathodes during electrolysis by adding to the electrolyte an oil-treated acid obtained by agitating one volume of naphthenic crude oil with about five volumes of about 78% to 95% sulphuric acid, causing the oil-treated acid to settle and a tar-like material to form on top, and removing the tar-like material, the resulting oil-treated acid being added to the electrolyte in an amount corresponding to that produced by the treatment of about 1.4 to 2.8 gallons of the crude oil per ton of copper cathodes precipitated.



2,408,669
COMBINATION SWITCH AND LIGHT CONTROL FOR FLOOR LAMPS
Leslie N. Mattson, Paulsboro, N. J.
Application May 4, 1944, Serial No. 534,138
2 Claims. (Cl. 240—123)

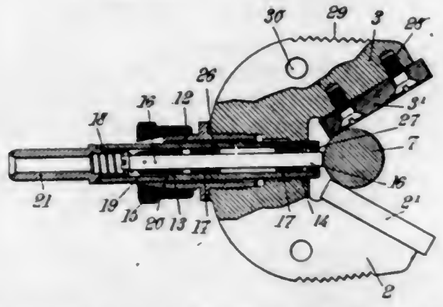
1. In an electric lamp including a pedestal, an enlarged upper end on said pedestal, a lamp shade having a rotating frame on said pedestal, a resistance coil mounted on a circular insulating base secured to occupy a stationary position in the enlarged upper end of the pedestal of the lamp, a contact rotatably mounted in the upper end of the pedestal contacting said resistance and adapted for operation through the medium of the frame of the lamp shade, a source of current connected to said resistance, a lamp bulb



connected to said contact, and an L-shaped insulated member secured to said contact having the upper end thereof forked to provide an operative connection between said contact and the frame of said shade.

2,408,670
SPINNING BUCKET ASSEMBLY
Henry J. McDermott, Prospect Park, Pa., assignor to American Viscose Corporation, Wilmington, Del., a corporation of Delaware
Application June 7, 1944, Serial No. 539,216
16 Claims. (Cl. 57—76)

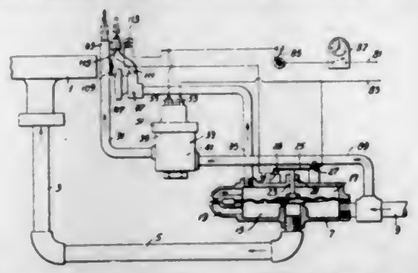
1. In combination, a removable shell adapted to be positioned in a spinning bucket and conforming to the shape thereof, a cover for the bucket, means for interlocking the cover and the bucket, and means for interlocking the cover and the shell.



2,408,671
EARTH-MOVING MACHINE
Arthur Burnard McFarlane, Harrow, England, assignor of one-half to Robert Lowe, Bexley Heath, England
Application December 1, 1943, Serial No. 512,501
In Great Britain November 23, 1942
3 Claims. (Cl. 37—126)

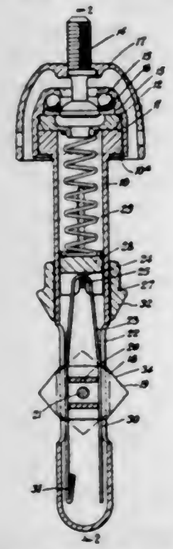
1. A bucket wheel scraper including a wheeled bucket, a scraper blade at the lower front edge of the bucket for passing dirt thereinto under a movable front apron, a longitudinally movable tailgate ejector for spilling earth from the bucket over the blade when required; a carriage adjacent each lateral edge of said tailgate for the support thereof, a rigid arm upstanding from each

carriage and a compressed resilient element extending across the rear of said bucket and being flexibly connected to each rigid arm for automatically returning said tailgate to its position at the rear of said bucket after ejection; said flexible connections being so related to said rigid arms as to partially compensate for the moment produced by the resistance encountered, particularly by the lower part of the tailgate during ejection of the contents of the bucket.



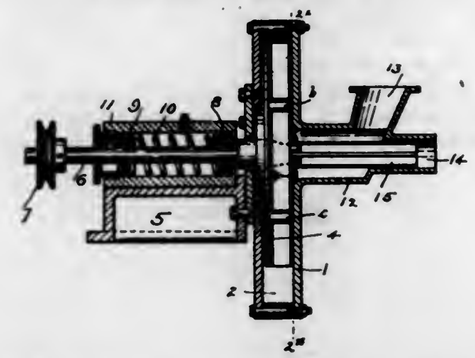
2,408,672
APPARATUS FOR MEASURING OR CHECKING TRANSVERSE DIMENSIONS
Marcel Mennesson, Neuilly-sur-Seine, France, assignor to Societe Anonyme Pour La Construction de Materiel Automobile (S. A. C. M. A.), Neuilly-sur-Seine (Seine), France, a society of the French Republic
Application March 3, 1945, Serial No. 580,748
In France April 22, 1944
8 Claims. (Cl. 33—178)

3. An apparatus of the type described for the measurement of pieces which comprises, in combination, a body including two branches the opposite faces of which are plane and inclined with respect to each other so as to form a V, said body being provided with a radial passage opening into the apex of the V and extending in the direction of the bisector thereof, a tube adjustable in said passage in the axial direction thereof, a push-rod slidable axially in said tube and projecting at one end therefrom into said V so as to be able to cooperate, through said end, with a piece to be measured and engaged between the branches of the V against the faces thereof, abutment means for preventing said rod from projecting into said V beyond a given position with respect to said tube, elastic means for urging said push-rod toward said position, bearings for guiding said push-rod in said tube, said bearings being provided with longitudinal channels affording an uninterrupted communication from one end to the other of said tube, said tube forming a conduit for the flow of a gaseous stream and being open at one end into the atmosphere, means for feeding a permanent gas under pressure to the other end of said tube, a valve in said tube adapted to control the section of flow therethrough, said valve being operatively connected with said push-rod, aand manometric means for measuring the pressure in said tube ahead of said valve.



2,408,673
GAS BURNER SYSTEM
John O. Moorhead, Attleboro, Mass., assignor to Metals and Controls Corporation, Attleboro, Mass., a corporation of Massachusetts
Application September 29, 1944, Serial No. 556,348
9 Claims. (Cl. 158—117.1)

1. A gas burner pilot system comprising a main burner and a pilot burner means, a diaphragm-controlled regulator valve controlling a supply of gas to the main burner, the gas being fed to one side of the diaphragm of said valve, the pilot burner means including a connection to the opposite side of the diaphragm of said valve, a connecting passage between the opposite sides of the diaphragm, a thermostatically controlled gas valve controlling at least part of the gas supply to the pilot burner means, a thermostatically controlled shut-off valve controlling at least some



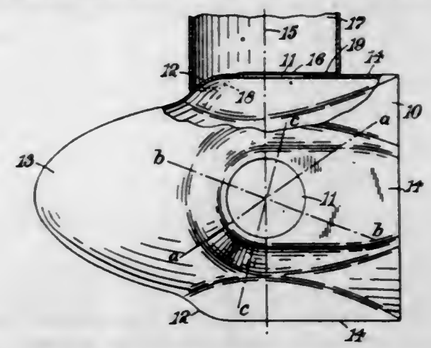
flow of gas supply from the diaphragm valve to the pilot burner means, pilot heater ignition means operatively associated with the pilot burner means, but outside of the pilot flame, an electric heater controlling the thermostatically controlled gas valve, circuit means including demand means arranged to control both of said heaters, and a switch responsive to diaphragm movement of said diaphragm valve adapted to open the circuit only to the pilot heater ignition means independently of the other heater means.

2,408,674
BOBBIN HOLDER
Joseph Noguera, Prestwich, Manchester, England, assignor to Casablancas High Draft Company Limited, Manchester, England, a British company
Application April 9, 1945, Serial No. 587,270
In Great Britain April 3, 1944
5 Claims. (Cl. 242—130)

1. Mechanism of the kind described for suspending bobbins in the creels of spinning or preparing machines, comprising a tubular casing, a catch pivotally mounted in said tubular casing so constructed as to be rotated into either a horizontal or vertical position, a resilient member of elongated U-shape mounted within said tubular casing having arms depending downwardly and embracing between them the catch, a hook carried by one of the arms of said resilient member adapted on upward movement of said member to engage and rotate said catch into either the horizontal or vertical position.

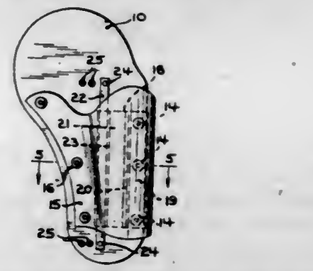
2,408,675
BLOWER FOR HANDLING DESICCATED MATERIAL
Orlo Clair Norton, Erie, Pa.
Application April 30, 1945, Serial No. 591,024
5 Claims. (Cl. 302—37)

1. In a blower, the combination with a casing having a laterally located discharge opening and a combined inlet for air and granular material opening into its center, of a rotary impeller provided with a plurality of channels extending inwardly from its periphery having their open inner ends located opposite said inlet and each closed off from the channels at its inner ends.



2,408,676
SOAP HOLDING BRUSH
William Novick, Brooklyn, N. Y.
Application October 6, 1944, Serial No. 557,389
1 Claim. (Cl. 15—160)

In a bath brush, a brush body shaped to provide adjacent its opposite ends laterally extending undercuts constituting dovetail seats opening at the opposite sides of said brush body and forming on the upper surface of said body at each end a laterally extending dovetail tongue, a plurality of straps of sufficient length to be grasped by the hands of a user in reciprocating the brush across the back of the user, finger loops at the outer ends of said straps, the inner ends of said straps being widened to correspond with the width of said brush body and being undercut laterally to provide dovetail seats and tongues for complementary attachment to the tongues and undercuts respectively of said brush body, the tongues of the straps and the seats of the body portion being bored to provide registering rectangular openings at the ends of said body and strap members when the same are assembled and a yieldable spring clip secured at each end of said body and having a finger portion for engagement with the bores of said straps and body for releasably attaching the straps to said body.

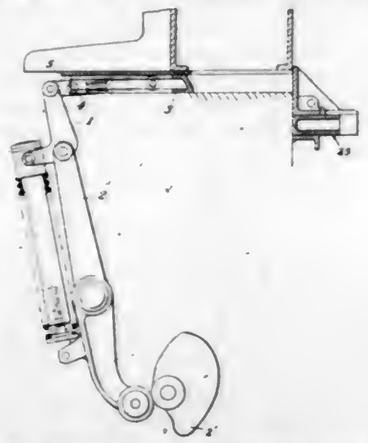


2,408,677
PROPELLER SPINNER
Frank Morgan Owner, Bristol, England, assignor, by mesne assignments, to Rotol Limited, Gloucester, England
Application August 23, 1943, Serial No. 499,674
In Great Britain March 23, 1942
5 Claims. (Cl. 170—159)

1. The combination of a propeller having blades each rotatable about its own longitudinal axis, and a spinner mounted on said propeller having cut-outs through which the blades project, said spinner being shaped to provide on the side of each cut-out adjacent the spinner nose, a portion raised above the general contour line of the spinner, said portion having a surface of revolution formed by the rotation about the longitudinal axis of a blade, of a line inclined

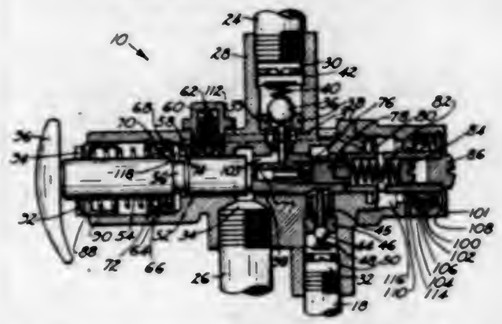
to said axis in the same sense as the spinner line, a flattened portion adjacent each cut-out on the side away from the spinner nose, said flattened portion being normal to the longitudinal axis of the blade and faired into said raised portion, said blades having root portions shaped to overlap said raised portion in a direction axially of the blade.

2,408,678
TOY HOLSTER FOR GUNS
Harry Paley, New York, N. Y.
Application May 4, 1945, Serial No. 591,987
3 Claims. (Cl. 224—2)



1. A toy holster, comprising a stiff shaped back sheet, and a flexible front sheet extending across the central area of said back sheet and having one side portion curved and bent under and attached to said back sheet and having the other side portion flat against and attached to said back sheet, and a cloth sheet between said flexible front sheet and said back sheet and attached along one side to the back face of said front sheet near said curved portion and having its other side releasably attached on the front face of said back sheet, and means of attaching said releasable side in several positions upon said back sheet.

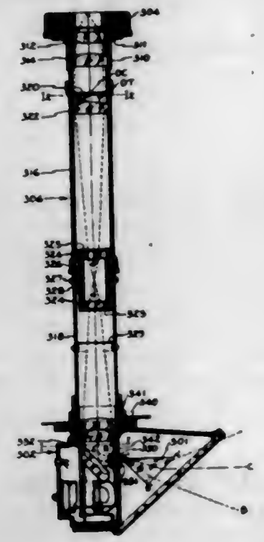
2,408,679
DOUGH DIVIDING MACHINE
Austin Richard Palmer, Peterborough, England, assignor to Baker Perkins Limited, Peterborough, England
Application June 12, 1944, Serial No. 539,924
In Great Britain May 19, 1943
4 Claims. (Cl. 107—15)



1. A dough dividing machine comprising a measuring compartment, reciprocating ram means feeding dough into said compartment, a pivotally mounted lever, a coupling rod connected to said ram, means comprising a lost motion

transmission connecting the coupling rod and said lever, said transmission incorporating a

spring buffer device, and a rotary cam for oscillating said lever through yielding means.



2,408,680
CHARGER VALVE
George W. Pontius, III, South Bend, Ind.
Application November 6, 1941, Serial No. 417,982
9 Claims. (Cl. 277—7)

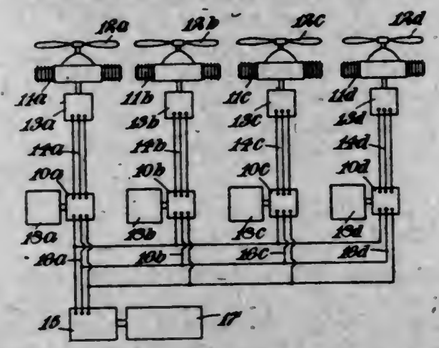
1. A remote control valve comprising a casing having an inlet from a source of fluid under pressure and having operating and exhaust outlets, a member movable to connect either the inlet or the exhaust outlet to the operating outlet, a spring urging the member to the position connecting the exhaust outlet to the operating outlet to close the valve, holding means for releasably holding the member in the open position connecting the inlet to the operating outlet, means for automatically overcoming said holding means to permit the valve to close upon increase of the pressure of the fluid within the casing above a predetermined pressure, closed means connected to the outlet to cause such increase of pressure, and means located in the inlet and controlled by the movement of the said member to prevent the entrance of fluid from the source of fluid power to the valve.

2,408,681
GUN TURRET SIGHTING COMPENSATION SYSTEM
George W. Pontius, III, Arthur P. Wilson, and Frank V. Kuzmitz, South Bend, Ind.
Application April 9, 1942, Serial No. 438,236
13 Claims. (Cl. 33—49)

1. In a sighting mechanism for guns movable in azimuth and zenith, a sighting means synchronized with the movement of the guns, a first electric meter positioned near said sighting means and moving a vertical cross hair laterally in said sighting means, and a second electric meter positioned near said sighting means and moving a horizontal cross hair laterally in said sighting means, a first balanced square bridge including the first said meter in one leg thereof, a second balanced square bridge including the said second meter in one leg thereof, a source of positive voltage, a source of zero voltage, and a source of negative voltage, a conductor connecting the source of zero voltage to one corner of both of said bridges, an electric cam mechanism connected to the positive and negative and zero voltages and to the first bridge at the opposite corner from the zero voltage connection of said first

bridge, said cam adapted to pass measured amounts of positive or negative voltage to said bridge dependent upon the position of the guns in azimuth and zenith to actuate said vertical cross hair to correct for lateral ballistics deflection, and a second electrical cam mechanism connected to said positive, negative and zero voltages and to the corner of the second bridge opposite to the zero voltage connection and adapted to pass measured amounts of negative voltage to said second bridge dependent upon the position of the guns in azimuth and zenith to actuate said horizontal cross hair to correct for vertical ballistics deflection.

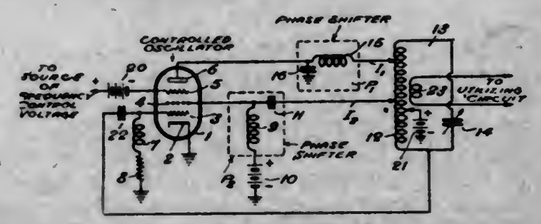
2,408,682
ADHERING OF POLYVINYL ALCOHOL COMPOSITIONS TO OTHER MATERIALS
Charles Arthur Porter, Nutley, N. J., assignor to Resistoflex Corporation, Belleville, N. J., a corporation of New York
No Drawing. Application December 28, 1944, Serial No. 570,222
12 Claims. (Cl. 154—139)



1. The method of making a composite product comprising polyvinyl alcohol composition and fibrous material in adhering relationship which comprises the steps of treating the fibrous material with a linear ethylene amine having the formula

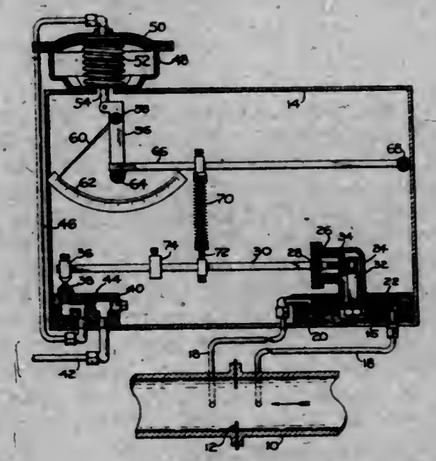
$$H_2N(—CH_2.CH_2.NH)_n—H$$

in which n is a whole number of 4 or less, and thereafter applying the polyvinyl alcohol composition to the thus treated fibrous material.



8. A composite product comprising a layer of fibrous material containing triethylene tetramine, and a layer of polyvinyl alcohol composition, said layers being adhered together.

2,408,683
SPEED-CONTROL AND SYNCHRONIZING DEVICE
Peter Ralph Price, Bristol, England, assignor, by mesne assignments, to Rotol Limited, Gloucester, England
Application July 8, 1943, Serial No. 493,921
In Great Britain February 19, 1942
6 Claims. (Cl. 170—135.6)

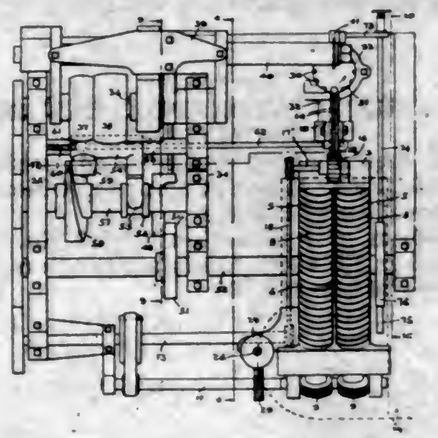


6. In an airplane having a plurality of engine driven propellers in which the propeller blades are adjustable for pitch changes, and pitch change motors severally associated with said plurality of propellers, a speed control and synchronizing device for said engines comprising a reference speed unit common to all said engines, a differential unit associated with each engine, one member of said differential unit driven by its associated engine and the other member driven by the reference speed unit whereby normal constant speed difference is maintained between the members, a flyweight governor driven by each differential unit and connected with the pitch change motor of the associated propeller, said governor controlling pitch change motor to maintain associated engine in synchronism with other engines, and means for adjusting datum speed of reference speed unit whereby speed of all engines is simultaneously varied and speeds are maintained in synchronism during variation.

2,408,684
FREQUENCY-VARIABLE OSCILLATOR CIRCUIT
Walter van B. Roberts, Princeton, N. J., assignor to Radio Corporation of America, a corporation of Delaware
Application February 4, 1943, Serial No. 474,646
1 Claim. (Cl. 250—36)

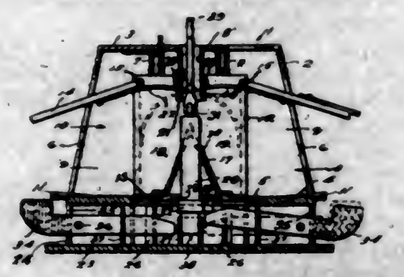
In an oscillator circuit comprising an electron discharge tube having at least a cathode, an anode and at least three successive grids in the space current flowing from the cathode to the anode, a coil and condenser connected in parallel to provide a tank circuit tuned to a predetermined oscillatory frequency, a source of direct current voltage, means connecting a predetermined intermediate point on said coil to a positive potential point of said source, a high frequency connection from the first grid adjacent said cathode to one end of said coil, a direct current connection from the anode to a point on the coil which is located on the opposite side of said predetermined intermediate point, a connection from the second grid to a point on the coil on the same side of said intermediate point as the anode point, respective phase shifters in said anode and second grid connections for providing phase shifts of opposite senses in the anode and second grid currents flowing through the connections, said connections to said coil being chosen to produce equal voltages in said tank circuit from said phase shifted currents, means for applying a negative biasing voltage to the third grid adjacent the anode, and means for varying the voltage of the third grid to vary the frequency of the tank circuit but without amplitude variation.

2,408,685
PRESSURE RESPONSIVE MEASURING INSTRUMENT
Albert J. Rosenberger, Chicago, Ill., assignor to Republic Flow Meters Company, Chicago, Ill., a corporation of Illinois
Continuation of application Serial No. 356,601, September 13, 1940. This application May 31, 1943, Serial No. 489,130
6 Claims. (Cl. 73—407)



1. A sensitive instrument comprising a pivoted beam, means responsive to a condition to be measured for creating a force acting on the beam to swing it in one direction, a pressure control device operated by movement of the beam for producing a pressure variable with movement of the beam, power means operated by the pressure and movable in response to variations therein, a pivoted lever lying substantially parallel to the beam, a spring connecting the beam and lever, a pivoted arm lying substantially at right angles to the beam and lever and connected to the power means to be moved thereby, and a roller carried by the free end of the arm and slidably engaging the lever adjacent its free end to move the lever an amount substantially proportional to the square of the movement of the arm.

2,408,686
MACHINE FOR SLOTTING SCREWS
John A. Rush, Milton, Ontario, Canada, assignor to P. L. Robertson Mfg. Co., Limited, Milton, Ontario, Canada
Application December 26, 1944, Serial No. 569,887
12 Claims. (Cl. 10—5)

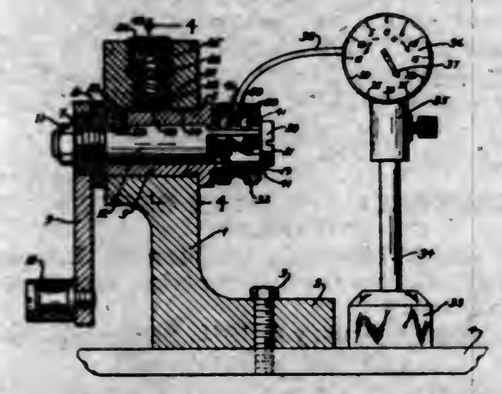


12. A screw slotting machine comprising a frame, a drive shaft journalled longitudinally in said frame, a saw shaft frame pivotally mounted axially of said drive shaft, a saw journalled longitudinally in said pivotal frame, a hopper mounted transversely of said frame, a pair of

parallel spaced-apart inclined spirally grooved cylindrical members journalled transversely of said frame beneath said hopper, a downwardly inclined slotted guide extending from the upper delivery end of said pair of spirally grooved cylindrical members, a rotatable blank-holding member arranged at the lower end of said inclined guide, a saw on said saw shaft arranged above said slotted rotatable member, means for locking screw blanks in said rotatable member, a cam shaft journalled longitudinally of the main frame having a cam thereon, means operated by said cam for operating said locking means, a

saw frame operating cam mounted on said cam shaft, means operated by the latter cam for lowering and raising said saw frame, ratchet means for rotating said slotted rotatable member, a guide arranged longitudinally of said main frame, a member slidable on said guide operatively connected with said ratchet means, a cam shaft journalled longitudinally of said frame, a cam on said cam shaft adapted to operate said ratchet-operating slidable member, and means for rotating said inclined rotatable spirally grooved members in opposite directions to feed screw blanks upwardly from said hopper to said inclined guide.

2,408,687
GAME APPARATUS
Emilio B. Sanchez, Miami, Fla.
Application April 20, 1945, Serial No. 589,300
4 Claims. (Cl. 273—138)

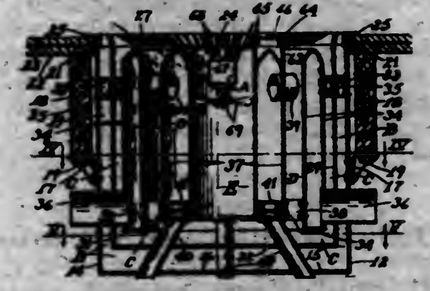


4. Apparatus for playing games comprising a base structure, operating levers extending into said structure and grouped around the center thereof, a housing surmounting the base structure and having a pair of vestibules at opposite sides thereof, and a pair of coin chutes in the top thereof, a vertically movable box in said housing between said vestibules divided into a pair of open-top compartments vertically aligned with said chutes, respectively, and provided with normally locked doors opening into said vestibules under vertical movement of said box, and means operative by said operating levers for moving said box vertically, and a key for rotating said post detachably therefrom.

2,408,688
SAFETY POCKET LOCK
Leopold Schenthal, New York, N. Y., assignor of one-third to Eugene Roth, Elmsford, and one-third to Nathan Jarvis, New York, N. Y.
Application August 11, 1944, Serial No. 548,969
2 Claims. (Cl. 2—251)

1. In a pair of trousers or the like having a back pocket and a side pocket adjacent thereto, a "zipper" closure including a slide provided on said back pocket, a snap button, one-half of said snap button being secured in said side pocket, a chain having one end secured to said slide and the other end to the other half of said snap button.

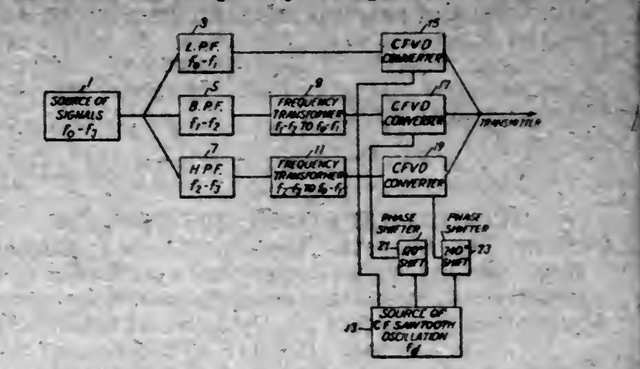
2,408,689
CONCENTRICITY GAUGE SPECIMEN HOLDER
John J. Seme, Maple Heights, Ohio, assignor, by mesne assignments, to Jack & Heintz Precision Industries, Inc., Cleveland, Ohio, a corporation of Delaware
Application May 8, 1944, Serial No. 534,664
5 Claims. (Cl. 279—1)



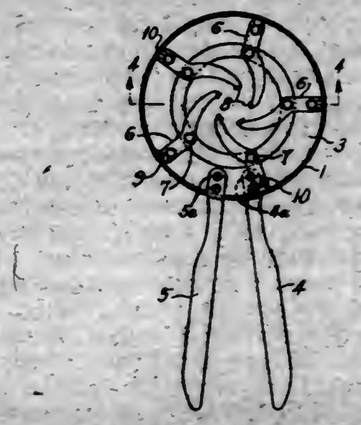
1. In a device for releasably retaining and rotating an inner ball bearing race so as to have its outer raceway in engagement with a metering gauge for measuring the concentricity of the raceway, a casing, a rotatable shaft and a bushing mounted thereon, an adjustable spring operated brake carried by the casing to bear against said bushing to normally hold it against rotation, a driving connection between said bushing and said shaft permitting a predetermined limited degree of lost motion therebetween, said bushing being adapted to slidably receive said ball race and having a ball containing cage, cam means on said shaft in engagement with said balls adapted upon manual rotation of said shaft to force said balls radially outwardly into gripping relationship with the interior surface of said ball race and rotate the same, and, upon release of manual rotation, to automatically permit retraction of said balls inwardly out of engagement with the ball race to permit its ready removal from said bushing.

2,408,690
POLYMERIZATION OF VINYL AROMATIC COMPOUNDS
Raymond B. Seymour, Dayton, Ohio, assignor to Monsanto Chemical Company, a corporation of Delaware
No Drawing. Application April 8, 1943, Serial No. 482,310
4 Claims. (Cl. 260—93)

1. The process of polymerizing a polymerizable vinyl aromatic compound, which comprises dissolving in said vinyl aromatic compound prior to complete polymerization a minor amount of sodium oleyl sulfate and oleyl alcohol and then polymerizing said solution in a mold to form a solid polymer.



2,408,691
FORCED DRAFT FLOOR HEATER
Walter M. Shaw, Arkansas City, Kans.
Application October 29, 1942, Serial No. 463,769
4 Claims. (Cl. 126—110)



1. A force draft floor heater comprising inner and outer casings having open upper ends, said casings having their side and bottom walls spaced apart, the bottom wall of the outer casing having an opening therein, inner and outer hollow annular drums within the inner casing, the inner drum defining a central air passage, said drums being spaced from each other to provide an annular space therebetween, said drums being spaced above the bottom wall of the inner casing, pipes connecting the spaces within the drums at the upper ends thereof with each other, vents leading from the outer drum, means for supplying fresh air to the lower end of the inner drum, burner means in the space within the inner drum, a power fan in the upper end of said air passage to force air downwardly and beneath the lower ends of the drums and thence upwardly through the annular space therebetween, a grill covering the open upper ends of the respective casings including vanes having their longitudinal axes lying substantially in a plane of the grill, the faces of the vanes being inclined upwardly and outwardly to direct air from the inner casing across the space between the upper open ends of the casings.

2,408,692
SIGNALING SYSTEM
Henry Shore, Jackson Heights, N. Y., assignor to Radio Corporation of America, a corporation of Delaware
Application April 29, 1942, Serial No. 440,893
14 Claims. (Cl. 250—6)

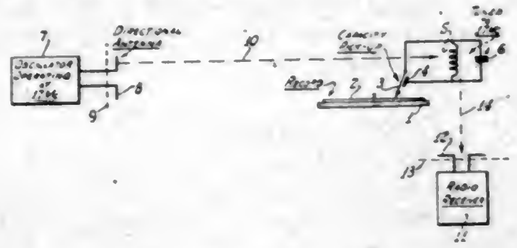
1. The method of signaling which comprises the steps of producing electrical signals having frequency components lying between two predetermined limits of frequency, separating the frequency components into a plurality of bands of frequency contiguous with each other, shifting all but one of the bands of frequency to occupy the same frequency range as the frequency range of the unshifted band of frequencies, converting each band of frequency components into constant-frequency variable-duration pulses and cyclically and sequentially transmitting pulses of each of the plurality of bands.

2,408,693
NIPPLE APPLYING IMPLEMENT
Melvin H. Sidebotham, Newton, Mass., assignor of one-half to Harlow M. Russell, Chelsea, Mass.
Application September 16, 1943, Serial No. 502,575
2 Claims. (Cl. 81—5.1)

1. An implement for applying expansible nipples to nursing bottles, comprising a base ring having an annular recess, an annular operating ring rotatably positioned in said annular recess, a handle secured to and extending radially outward from the base ring, a second handle secured to and extending radially outward from the operating ring and lying in close proximity to the handle on the base ring, a plurality of expansion arms spaced equidistant about the base ring, pivot pins fixed in the base ring intermediate the ends of the expansion arms for pivotally supporting each expansion arm, a prong at the inner extremity of each expansion arm extending upward at right angles to the main portion of the said expansion arms, and pins secured to the operating ring and engaging the expansion arms for actuating the outer end of each expansion arm.

2,408,694
METHOD OF PREPARING ACYL GUANIDINES
John Kenson Simons, Toledo, Ohio, and Welcome I. Weaver, Pittsburgh, Pa., assignors, by mesne assignments, to Libbey-Owens-Ford Glass Company, a corporation of Ohio
No Drawing. Application May 29, 1942, Serial No. 445,991
1 Claim. (Cl. 260—564)

A method of preparing acyl guanidines that comprises reacting guanidine carbonate with an



alkali metal in an anhydrous solvent selected from the class consisting of ethyl alcohol and p-dioxane, concentrating the resulting solution of guanidine, and reacting with an ester of an acid selected from the class consisting of alkyl, aryl and mixed alkyl and aryl carboxylic acids, to introduce into the guanidine molecule the acyl radical of said acid.

2,408,695

RECORD REPRODUCING SYSTEM

Chester M. Sinnett, Westmont, and Herbert Belar, Palmyra, N. J., assignors to Radio Corporation of America, a corporation of Delaware

Application November 25, 1942, Serial No. 466,878
14 Claims. (Cl. 179—100.4)

1. In combination, a sound wave record, an electrical pickup device associated therewith to translate the recorded sound waves into variations in reactance, a resonant network electrically connected with said pickup device and adapted to have its frequency varied by said reactance variations, means for producing high frequency wave energy, said means being spaced from said resonant network, said resonant network being normally tuned to the frequency of said high frequency wave energy, said high frequency wave energy being radiated to said resonant network in the form of a beam whereby the high frequency energy at said network is modulated in accordance with the recorded sound waves, said resonant network having a sufficiently high "Q" to provide re-radiation therefrom, and a receiver spaced from said resonant network and being free of normal coupling thereto and being adapted to receive therefrom reradiated modulated high frequency wave energy.

2,408,696

TREATMENT OF CARBON BLACK

Hugh M. Smallwood, Nutley, N. J., assignor to United States Rubber Company, New York, N. Y., a corporation of New Jersey

No Drawing. Application July 13, 1940, Serial No. 345,429
8 Claims. (Cl. 106—307)

1. A process which comprises treating finely divided hydrogen-containing carbon black with gaseous halogen for a time and at a temperature sufficient to leave more than about 1% hydrogen halide adsorbed on the black.

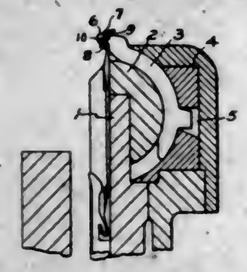
2,408,697

GARMENT HANGER ATTACHMENT

Michael F. Smith, Los Angeles, Calif.

Application July 23, 1945, Serial No. 606,579
6 Claims. (Cl. 223—93)

1. A garment hanger attachment of the kind described comprising a resilient wire frame consisting of two approximately parallel basal runs, said runs at one end each being continued as an upward vertical run which in turn is continued by a forward approximately horizontal upper run at each side of the attachment, the latter runs also being approximately parallel to said lower or basal runs, said upper runs being slightly dipped downwardly throughout their front portions, their forward ends being united by a transverse front wire run, a link linking together the rear portions of the latter runs, each of said basal or lower runs of the wire frame having its front end portion directed steeply downwardly and terminating in an eye, a pin bridging the space between said



eyes, and a triangularly shaped dog having one of its corner portions pivotally related to said pin whereby said dog is adjustable to bring one of its faces into an abutting relation to a hanger bar to which the attachment is applicable, allowing when so adjusted an upward tilting of said upper wire runs in relation to the hanger bar and when adjusted with another of its faces abutting said hanger bar draws said upper wire runs downwardly yieldingly against the upper surface of the hanger bar.

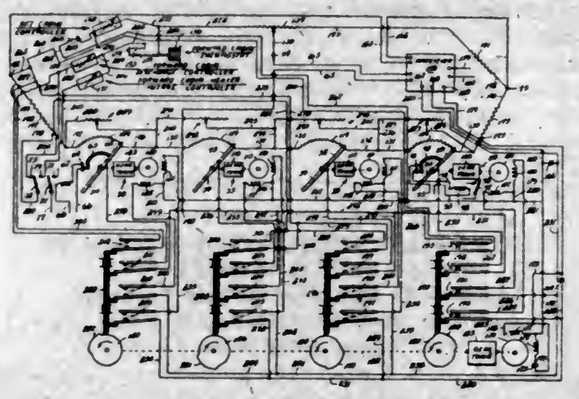
2,408,698

KNITTING MACHINE AND METHOD OF KNITTING

Norman H. Smith, Pawtucket, R. I., assignor to Hemphill Company, Central Falls, R. I., a corporation of Massachusetts

Application October 21, 1944, Serial No. 559,775
4 Claims. (Cl. 66—14)

1. A method of knitting upon a knitting machine having opposed, axially aligned, cylinders independently operated needles and sinkers each movable in an arcuate path relative to the cylinders and having a back shaped to an arc concentric with said path which includes the steps of drawing loops over backs of sinkers behind the nibs and through the corresponding needle loops of a previous course casting off the needle loops of the previous course by the sinkers acting upon the adjacent sinker loops only and transferring the newly drawn loops from the backs to the throats of the sinkers over their nibs.



2,408,699

AIRCRAFT TEMPERATURE CONTROL

Hubert T. Sparrow, Minneapolis, Minn., assignor to Minneapolis-Honeywell Regulator Company, Minneapolis, Minn., a corporation of Delaware

Application November 30, 1942, Serial No. 467,385
12 Claims. (Cl. 172—239)

12. In a normally balanced system of the follow up type, a main controller, a plurality of follow up controllers connected together and all of which jointly have a follow up range corresponding to the range of said controller, a plurality of devices to be positioned, each of which is operative to operate a different one of said follow up controllers, and means associated with said devices and responsive to the unbalance between said main controller and said plurality of follow up controllers for positioning any one of said

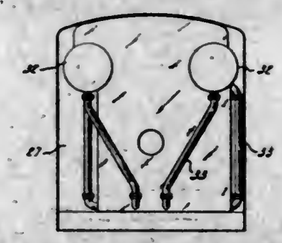
devices as long as said system can be balanced by operation of the follow up controller associated with that device, and means to prevent said last named means from causing positioning of any one device while the system is unbalanced until the preceding follow up controller has been operated to the extreme limit of its follow up range.

2,408,700

SYNTHETIC WAX COMPOSITION

Murray M. Sprung, Scotia, N. Y., assignor to General Electric Company, a corporation of New York

No Drawing. Application July 16, 1943, Serial No. 495,045
11 Claims. (Cl. 106—287)



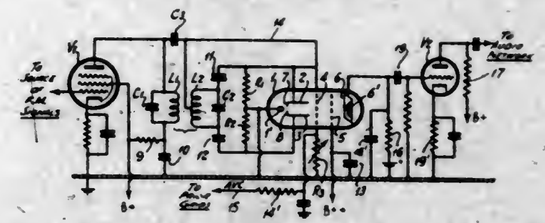
1. The wax-like heat-reaction product of substantially stoichiometrical proportions of an aliphatic polyamine and a halogenated aromatic compound selected from the class consisting of nuclearly halogenated aromatic monocarboxylic and ortho-dicarboxylic acids and acid halides.

2,408,701

STEAM MOTIVE POWER

Charles J. Surdy, Erie, Pa., assignor to The Standard Stoker Company, Incorporated, a corporation of Delaware

Application May 31, 1944, Serial No. 538,165
3 Claims. (Cl. 105—36)



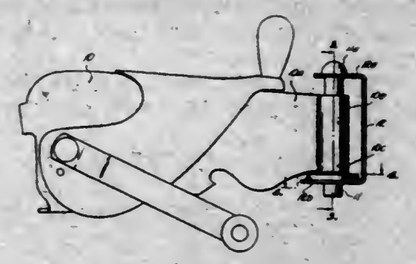
1. A railroad motive power unit comprising a steam generating plant, the upper portion of said steam generating plant being disposed within the outer confines of the unit and extending substantially the width thereof, the lower portion thereof being indented along one side providing a passageway between said indented side and the side of the said unit and beneath the upper portion of said steam generating plant, turbo-electric generating means forward thereof operable by steam from said plant, said turbo-electric generating means being disposed in said unit to provide a passageway along one side thereof, a control cab forward of said turbo-electric generating means, a fireman's space at the rear of said steam generating plant, and fuel and water compartments at the rear of said fireman's space, said fuel and water compartments being offset to one side of said unit to provide a passageway, said passageways being in communication and extending from said control cab rearwardly through the end of said unit.

2,408,702

ANGLE MODULATED WAVE DETECTOR

George Clifford Sziklai, Princeton, N. J., assignor to Radio Corporation of America, a corporation of Delaware

Application May 20, 1944, Serial No. 536,457
10 Claims. (Cl. 250—27)

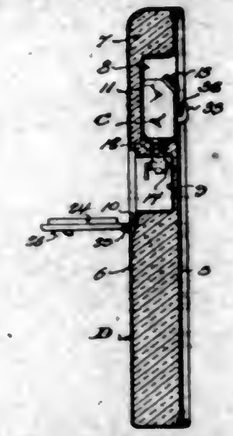


1. In combination with a beam tube of the type having an output electrode provided with a secondary emission area of predetermined non-uniform configuration, means, adapted to be responsive to phase displacements of a pair of alternating current voltages from a predetermined normal phase relation, for sweeping the electron beam of said tube over said area thereby to vary the potential of said output electrode and means responsive to amplitude variations of said voltages for automatically controlling the intensity of said beam.

2,408,703

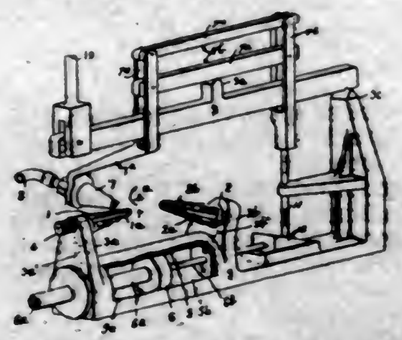
WALL BRACKET FOR KITCHEN UTENSILS

Henry J. Talge and William J. Landry, Kansas City, Mo., assignors to John C. Hockery, Foster L. Talge, and Henry J. Talge, doing business as Rival Manufacturing Company, Kansas City, Mo.



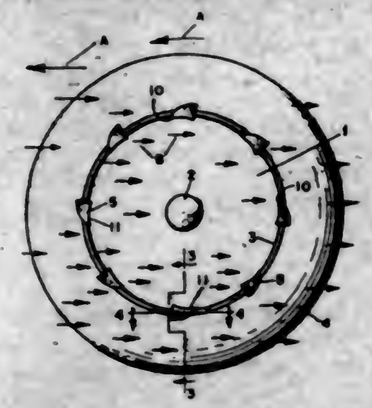
Application November 30, 1945, Serial No. 631,874
2 Claims. (Cl. 248—282)

1. A pivotal support for a kitchen utensil, comprising a bracket adapted to be secured to the wall, said bracket having a pair of vertically spaced horizontal ears extending forward from the wall, a hinge pin carried by said ears so its shank extends vertically from one ear to the other, the lower ear having, around said pin, a shallow well with a noncircular top opening, a sleeve encircling said pin and having at its lower end a noncircular exterior periphery adapted to register with the top opening of said well when said sleeve occupies a particular rotary position, whereby said sleeve is movable axially of said pin in or out of said well when it is in said particular rotary position and is rotatable to other



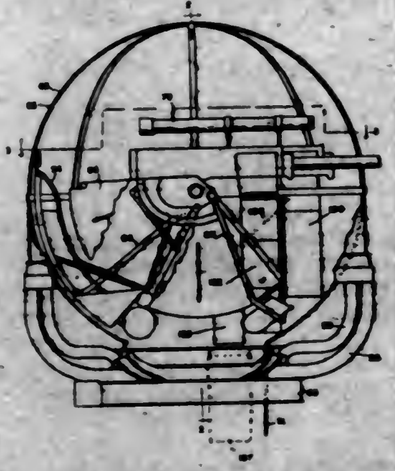
positions only when it is out of said well, and an elongated device rigidly secured at one end to said sleeve so said device is normal to the wall when said lower end of said sleeve is in said well.

2,408,704
LIQUID COOLER FOR REFRIGERATORS
George R. Taylor, Kenosha, Wis.
Application May 4, 1944, Serial No. 534,172
1 Claim. (Cl. 62—89)



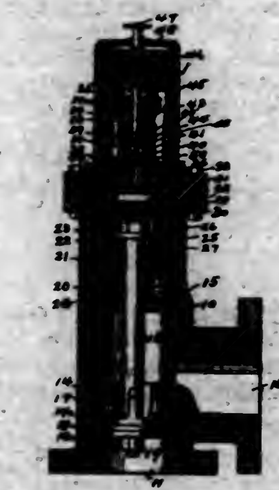
A refrigerator wall or door having an upper inwardly directed pocket formed in its inner face and a lower inwardly directed pocket formed in its outer face, said pockets being connected at spaced points by openings, removable liquid dispensing jars fitted in said upper pocket having necks extending into said openings, sealing gaskets fitted in said openings and surrounding said necks, detachable valves disposed in the lower pocket connected with said necks, a closure for completely sealing the lower pocket and hiding said valves from view, when said closure is in its closed position, and means for holding the closure at right angles to the outer face of said door when in its fully open position to provide a serving tray.

2,408,705
MECHANICAL RELAY OF THE FLUID JET TYPE
Keith Watson Todd, Warrington, England, assignor to Metropolitan-Vickers Electrical Company Limited, London, England, a company of Great Britain
Application December 31, 1943, Serial No. 516,595.
In Great Britain May 28, 1940, and September 6, 1940
3 Claims. (Cl. 121—41)



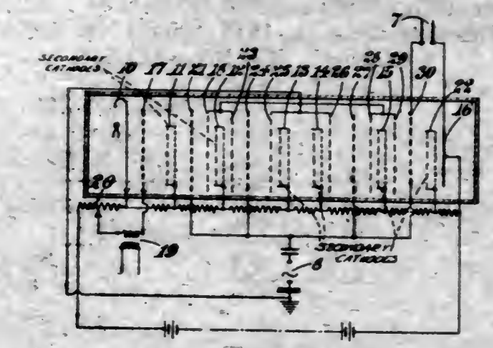
1. A fluid-jet relay comprising a transmitting nozzle adapted to be supplied with pressure fluid, an orifice for receiving the fluid jet from the transmitting nozzle, a controlling nozzle for directing pressure fluid transversely of the jet from the transmitting nozzle, means responsively operable to a control influence for varying the inclination of incidence of the transverse jet with the jet from the transmitting nozzle, means responsive to pressure fluid received by the receiving orifice for rendering available an influence representative of said control influence, said transmitting nozzle and receiving nozzle being arranged with the axis of the transmitting nozzle passing through the area of the receiving nozzle and inclined to the axis of the receiving orifice so as to subtend therewith an angle of at least five degrees from coaxial alignment.

2,408,706
ROTATING MEANS FOR AIRPLANE LANDING WHEELS
Henry Travis, Ocean Beach, Calif.
Application May 16, 1945, Serial No. 594,111
1 Claim. (Cl. 244—103)



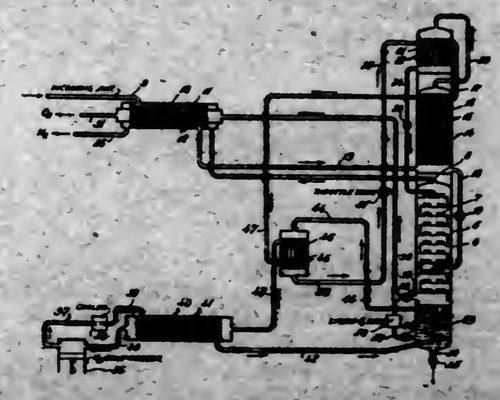
In combination with a landing wheel for aircraft, a plurality of cup-shaped downwardly curved, streamlined vanes having pointed tails, having one edge welded to the wheel adjacent to the rim and the other edge welded to the rim adjacent the first weld, said vanes arranged in spaced circumferential relationship to rotate the wheel by contact of the vanes with the air body prior to landing.

2,408,707
GUN MOUNTING AND CONTROL MECHANISM
Preston T. Tucker, Detroit, Mich., and Willis G. Stewart and James H. Tanner, New York, N. Y., assignors to Tucker Aircraft Corporation, Detroit, Mich., a corporation of Michigan
Application August 16, 1941, Serial No. 407,108
17 Claims. (Cl. 89—37.5)



10. In a gun mount, in combination with a fixed support, a frame rotatable therein about a generally vertical axis, a gun-support journaled in the frame for elevational rotation about a generally horizontal axis and also rotatable with the frame in traverse about said vertical axis, means for rotating the gun support in each direction about said horizontal axis, means for reversing the direction of rotation of each of said rotatable means, stop means for interrupting rotation of said frame in either direction in which it is being driven without interfering with operation of said reversing means, said stop means including an electric switch and operating means therefor having one part carried by said frame and another part carried by said fixed support, and means responsive to rotation of said gun support beyond predetermined positions about both axes for actuating said stop means.

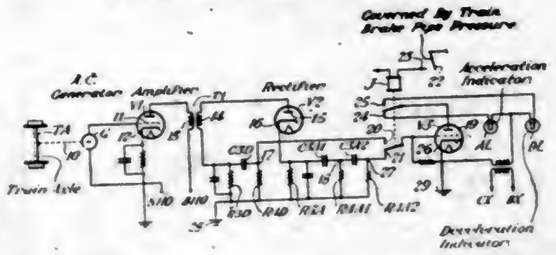
2,408,708
HYDRAULIC RELIEF VALVE
Charles E. Tweedle, Great Lakes, Ill., assignor, by direct and mesne assignments, to Theodore Placette, Hays County, Tex.
Application November 22, 1943, Serial No. 511,301
2 Claims. (Cl. 137—53)



2. A pilot control valve assembly for a main pressure relief valve having a plate form valve head provided with a pair of adjacent fluid passage apertures, said assembly comprising; a hollow generally cylindrical pilot valve housing having an external flange at each end and an internal flange at one end, the external flange at said one end adapted to be detachably secured to said valve head with said internal flange adjacent said head and substantially concentric with one of said head apertures; a valve seat of wear resistant material within said housing resting on said internal flange and having an aperture coaxial with said one of the head apertures; a hollow sleeve provided with an internal shoulder, said sleeve being inserted in said housing and bearing at one end against said valve seat and provided at its opposite end with an external flange detachably secured to the corresponding external flange on said housing; a fluid passage in said sleeve and said housing leading from the space within said sleeve at the side of said seat remote from said internal flange to the other fluid passage aperture in said valve head; a valve plunger slidable in said sleeve provided at one end with an aperture closing portion cooperating with said seat, at its opposite end with a weight table and intermediate its length with an annular flange cooperating with said internal shoulder in said sleeve to limit movement of said plunger relative to said sleeve; removable weights on said weight table; and a cover for said pilot control valve adapted to be independently detachably secured to said valve head.

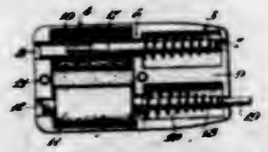
2,408,709
ELECTRON MULTIPLIER
Francois Joseph Gerard van den Bosch, Surrey, England, assignor to Radio Electronics Limited
Application August 10, 1942, Serial No. 454,214
In Great Britain August 5, 1940
6 Claims. (Cl. 250—27)

1. An electron multiplier apparatus comprising a primary cathode, an anode, a number of pairs of velocity-controlling electrodes and at least one secondary cathode disposed between the primary cathode and anode, means for applying direct current potentials of ascending order to said primary cathode, secondary cathode and anode, means for applying an alternating field between the electrodes of each pair of velocity-controlling electrodes, the distance apart between electrodes of successive pairs of velocity-controlling electrodes being selected in accordance with the phase relationship of their potentials so that the transit time of an electron is such that it passes through a succeeding field at approximately the same stage in the cycle as that when it passed through the preceding field.



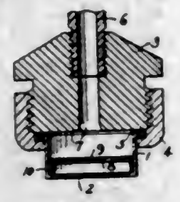
2,408,710
PROCESS FOR SEPARATING THE CONSTITUENTS OF AIR
Claude C. Van Nuys, Greenwich, Conn., assignor to Air Reduction Company, Incorporated, New York, N. Y., a corporation of New York
Application December 17, 1943, Serial No. 514,593
8 Claims. (Cl. 62—175.5)

1. The method of separating the constituents of atmosphere air in a liquefaction apparatus by liquefaction and rectification which comprises compressing nitrogen to a relatively high pressure, liquefying the nitrogen, compressing the air to a pressure not materially in excess of that required



to overcome the resistance to travel of the air through the apparatus without abrupt change in pressure, subjecting the air to indirect heat exchange with the liquid nitrogen to separate liquid fractions enriched respectively in oxygen and nitrogen, and rectifying the two fractions to recover substantially pure liquid oxygen.

2,408,711
APPARATUS TO DETECT CHANGE OF VOLTAGE
Carl Volz, Pittsburgh, Pa., assignor to The Union Switch & Signal Company, Swissvale, Pa., a corporation of Pennsylvania
Application June 15, 1945, Serial No. 599,677
5 Claims. (Cl. 177—311.5)



1. In combination, a source of alternating voltage operatively associated with an operating element to supply a voltage which varies according to a given variable condition of the operating element, an electro-responsive indicating means, ionization means, means to energize said indicating means by conduction current of the ionization means but said ionization means normally deionized; a circuit network including a rectifier, capacitors and resistors connected to said voltage source to charge and discharge said capacitors in step with increases and decreases of the voltage of said source to create corresponding direct voltages across said resistors by the charging and discharging currents; and said circuit network connected to control elements of said ionization means to effect ionization and a resultant conduction current by said direct voltage due either to a predetermined rate of increase or a predetermined rate of decrease in the voltage of said source.

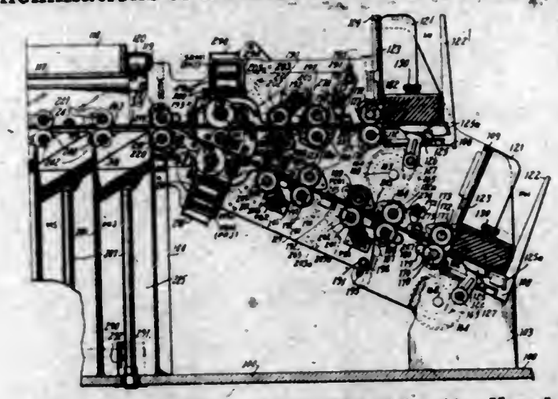
2,408,712
POWER UNIT FOR ELECTRIC CHIMES
Chauncey E. Waltman, Chicago, Ill., assignor to NuTone, Incorporated, New York, N. Y., a corporation of New York
Application August 24, 1943, Serial No. 499,808
9 Claims. (Cl. 175—337)

1. An electro-magnetic power unit for an electrical chime, comprising a moulded plastic casing comprised of separable sections having cavities therein, constituting a recess extending longitudinally of the casing, a coil having a hollow core member seated within said recess, a striker member slidable within said core member, terminal members supported on said casing at a face thereof and being in electrical interconnection with the terminals of said coil, and means for holding said separable sections together to support the coil and striker therewithin.

2,408,713
EXTRUSION DEVICE
Wesley L. Webb, Glen Moore, Pa., assignor to American Viscose Corporation, Wilmington, Del., a corporation of Delaware
Application February 5, 1944, Serial No. 521,221
5 Claims. (Cl. 18—8)

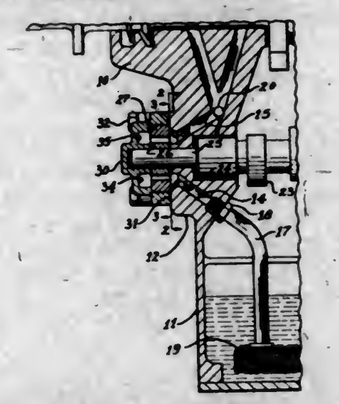
1. An extrusion device for simultaneously forming a plurality of filaments comprising a supply duct, a spinneret arranged to receive filament-forming material from the duct and having a plurality of rows of orifices disposed generally throughout an area considerably larger than the cross-section of the duct, and means comprising a rigid member having a plurality of apertures each larger than any one of the spinneret orifices disposed between and being spaced from each of the spinneret and the duct, said apertures facing the orificed area of the spinneret and being disposed over an area substantially co-extensive with that occupied by said plurality of rows of orifices, said member being constructed and arranged to provide for substantially the same rate of flow through each of the several orifices independent of location with respect to the duct whereby the pressure and distribution of the material to the spinneret is controlled.

2,408,714
SAFE SCREEN SUPPORT
John Whalen, Brooklyn, N. Y.
Application September 16, 1944, Serial No. 554,482
3 Claims. (Cl. 160—107)



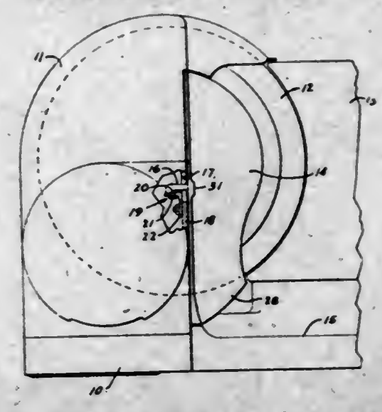
1. The combination with a window screen having relatively slidable frames provided with screen sections, of a C-shaped member adapted to partly enclose an upper side bar of each frame member and provided with a struck-out L-shaped flange adapted to slidably engage the lower edge of a sash under which the window screen is to be positioned.

2,408,715
RECORD CONTROLLED MACHINE
Victor O. Wilkerson, Vestal, N. Y., assignor to International Business Machines Corporation, New York, N. Y., a corporation of New York
Application November 14, 1942, Serial No. 465,606
8 Claims. (Cl. 209—110)



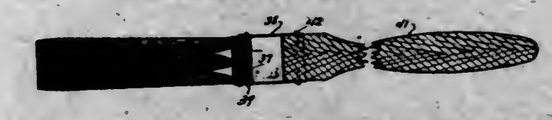
1. In a record assorting machine, sorting means, means to feed one portion of a serially designated set of records and separate means to feed the other portion in step with the first portion, said portions together supposedly comprising a complete single serial sequence having serial number designations, a certain number of the denominations being identically serially designated throughout said set, the remaining denominations comprising two separate sequences, means to sense the designations in both portions, means to count

the records of both portions according to the repeated sequences, comparing means controlled by the sensing means and counting means for comparing the identically designated denominations of a record from one portion with the same denominations of a record from the other portion



to detect non-identity of the identically designated denominations and to detect non-identity of the remaining denominations of either portion with the counting device, and means controlled by said comparing means for controlling the sorting means to segregate all non-identical records from the identical records.

2,408,716
PUMP CONSTRUCTION
Eugene S. Witchger, Grosse Pointe, Mich., assignor to Eaton Manufacturing Company, Cleveland, Ohio, a corporation of Ohio
Application December 10, 1942, Serial No. 468,500
5 Claims. (Cl. 103—126)

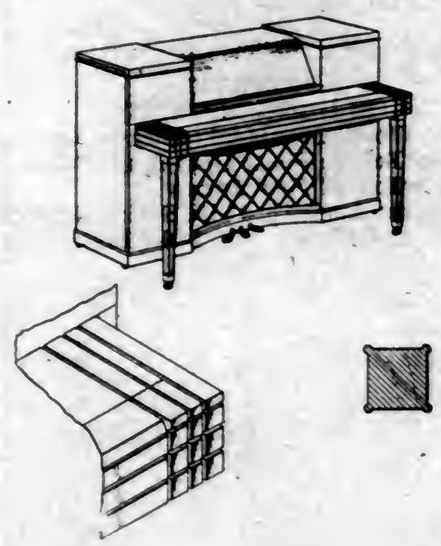


1. The combination in a rotary pumping mechanism of the character described having a change in volume of the working fluid effective through a substantial portion of a pumping cycle; of housing means forming a pumping chamber, a pair of rotary pumping elements in said chamber which cooperate to define hollow cavities between them that expand and contract to produce suction and compression phases during rotation thereof, said housing means having intake and discharge ports located therein adjacent one end of said pumping elements and of inadequate length circularly of said elements to accommodate sufficient working fluid for a complete pumping cycle thereof with relation to the respective pumping cavities adjacent thereto, said housing means being provided with distributing porting therein adjacent the opposite end of said pumping elements, and said distributing porting being of sufficient length circularly of said elements and disposed in accurately timed relation to the cavities in said pumping elements to balance pressures developed in the working fluid through the same portion of the pumping cycle as first mentioned, whereby a continuous efficient discharge is effected during that portion of the pump cycle in which a portion of the pumping cavities communicated with said inadequate intake and discharge ports are compensated for by the change in volume of the working fluid in other pumping cavities communicated therewith only through the distributing porting.

2,408,717
SLICING MACHINE
George R. Wood, Montreal, Quebec, Canada, assignor to Toledo Scale Company, Toledo, Ohio, a corporation of New Jersey
Application April 12, 1943, Serial No. 482,768
2 Claims. (Cl. 146—102)

1. In a slicing machine having a drive housing, a rotatable circular knife, a slice receiver, and a slice deflector, mounting means for said slice deflector comprising a stud projecting from said housing substantially perpendicular to the plane of the knife, and a second stud disposed perpendicularly to said first stud and mounted in a member attached to said housing and adjustable along a line parallel to said first stud and means on said deflector plate for engaging said studs.

2,408,718
HIGH CAPILLARITY BRISTLE
Elmer H. Haux, Baltimore, Md., assignor to Pittsburgh Plate Glass Company, Allegheny County, Pa., a corporation of Pennsylvania
Application June 1, 1944, Serial No. 538,277
7 Claims. (Cl. 15—159)

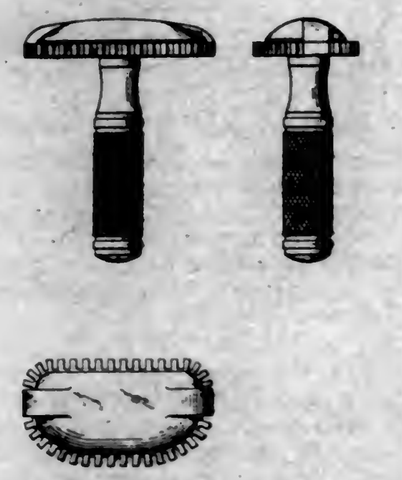


1. A brush comprising tapered synthetic bristles of plastic having surfaces roughened by means of a comminuted fibrous filler embedded in the plastic.

DESIGNS

OCTOBER 1, 1946

145,648
DESIGN FOR A PIANO
Alfons Bach, New York, N. Y.
Application May 23, 1945, Serial No. 119,681
Term of patent 14 years
(Cl. D56—9)

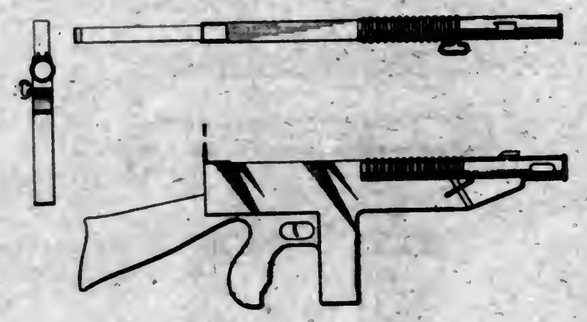


The ornamental design for a piano as shown and described.

145,649
DESIGN FOR A PIANO
Alfons Bach, New York, N. Y.
Application May 23, 1945, Serial No. 119,682
Term of patent 14 years
(Cl. D56—9)

The ornamental design for a piano as shown and described.

145,650
DESIGN FOR A SAFETY RAZOR
Lena M. Baer, Topeka, Kans.
Application December 7, 1945, Serial No. 124,437
Term of patent 14 years
(Cl. D22—3)

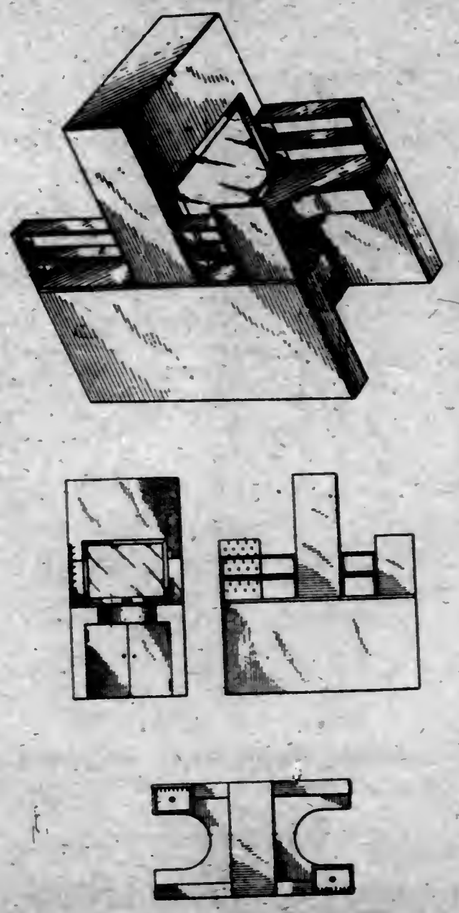


The ornamental design for a safety razor, as shown.

145,651
DESIGN FOR A DRAFTING TABLE BASE
Robert M. Bennett, Downers Grove, Ill., assignor to Western Electric Company, Incorporated, New York, N. Y., a corporation of New York
Application December 6, 1945, Serial No. 124,431
Term of patent 14 years
(Cl. D33—14)

The ornamental design for a drafting table base, as shown and described.

145,652
DESIGN FOR A TOY GUN
Samuel I. Berger, Newark, N. J.
Application September 24, 1945, Serial No. 122,293
Term of patent 14 years
(Cl. D84—15)

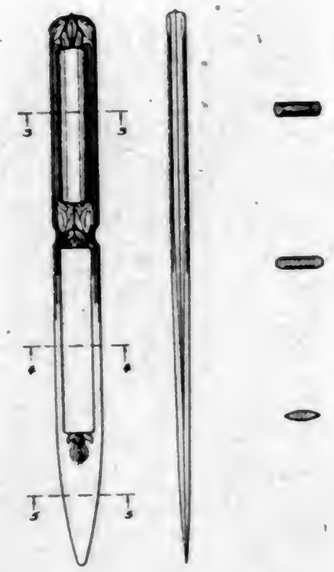


The ornamental design for a toy gun, substantially as shown.

145,653
DESIGN FOR A COMBINED COASTER AND ASH TRAY HOLDER
Leo J. Binder, Spokane, Wash.
Application August 3, 1945, Serial No. 121,192
Term of patent 14 years
(Cl. D85—2)

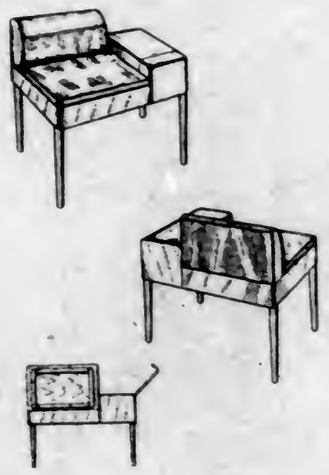
The ornamental design for a combined coaster and ash tray holder, as shown.

145,654
DESIGN FOR A LABORATORY WORKBENCH
Johan Bjurksten, Chicago, Ill.
Application September 4, 1945, Serial No. 121,836
Term of patent 14 years
(Cl. D32—7)



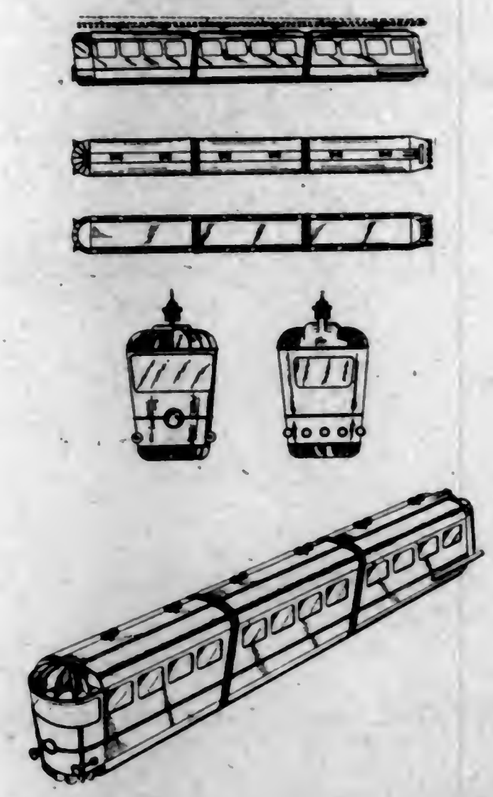
The ornamental design for a laboratory workbench, substantially as shown, and described.

145,655
DESIGN FOR A CHAIR CART
Louis P. Brantz, Philadelphia, Pa.
Application August 5, 1943, Serial No. 110,844
Term of patent 3½ years
(Cl. D14—3)



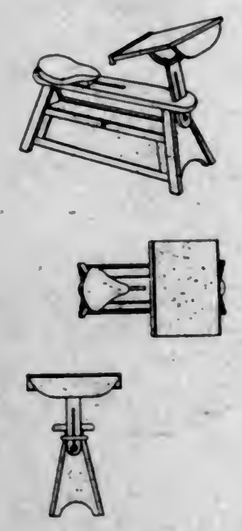
The ornamental design for a chair cart, substantially as shown.

145,656
DESIGN FOR A LETTER OPENER
John J. Calichio, Forest Hills, N. Y.
Application June 29, 1946, Serial No. 131,176
Term of patent 14 years
(Cl. D74—1)



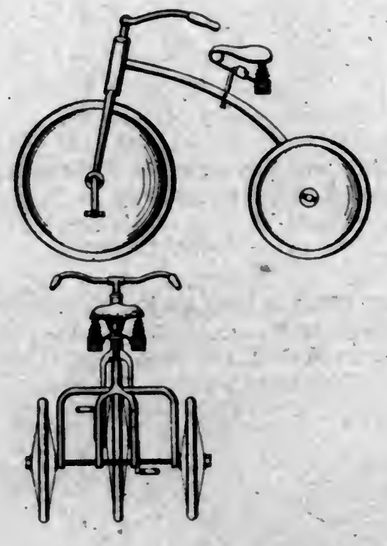
The ornamental design for a letter opener, as shown and described.

145,657
DESIGN FOR A COMBINED SETTEE AND TELEPHONE CABINET
Frank P. Case, Chicago, Ill., assignor of one-half to Henry A. Gosling, Chicago, Ill.
Application August 6, 1945, Serial No. 121,246
Term of patent 7 years
(Cl. D15—11)



The ornamental design for a combined settee and telephone cabinet, as shown.

145,658
DESIGN FOR AN OVERHEAD MONORAIL TRAIN
Clinton B. Clark, Oak Park, Ill.
Application October 15, 1945, Serial No. 122,843
Term of patent 14 years
(Cl. D66—1)

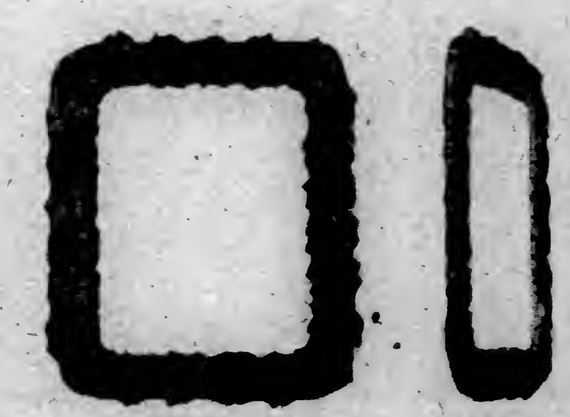


The ornamental design for an overhead monorail train, substantially as shown and described.

145,659
DESIGN FOR A COMBINATION DESK AND SEAT
James D. Covington, Dallas, Tex., assignor to Hilltop Manufacturing Company, Cockrell Hill, Tex.
Application October 15, 1945, Serial No. 122,858
Term of patent 7 years
(Cl. D33—11)

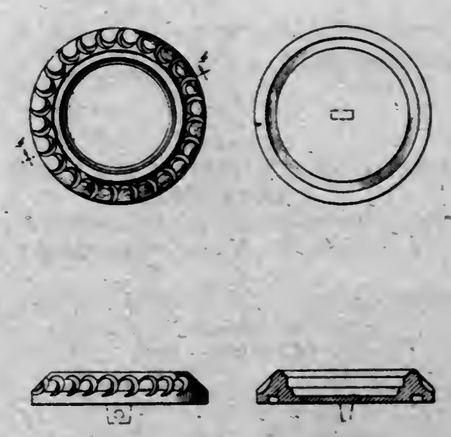
The ornamental design for a combination desk and seat, as shown.

145,660
DESIGN FOR A TRICYCLE
William H. Culler, San Marino, Calif.
Application September 8, 1945, Serial No. 121,931
Term of patent 7 years
(Cl. D34—15)



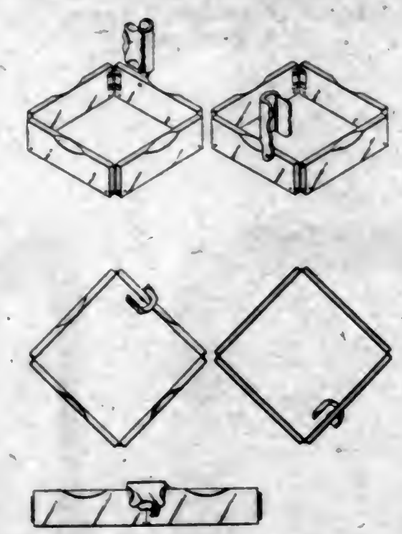
The ornamental design for a tricycle, as shown.

145,661
DESIGN FOR A CONTAINER CAP
Philip A. Derham, Rosemont, Pa., assignor to Victor Metal Products Corporation, Brooklyn, N. Y., a corporation of New York
Application October 29, 1945, Serial No. 123,265
Term of patent 14 years
(Cl. D58—26)



The ornamental design for a container cap, substantially as shown.

145,662
DESIGN FOR A MIRROR FRAME OR THE LIKE
Freda Diamond, New York, N. Y., assignor to Syracuse Ornamental Co., Syracuse, N. Y., a copartnership
Application August 23, 1945, Serial No. 121,585
Term of patent 7 years
(Cl. D29—20)



The ornamental design for a mirror frame or the like, substantially as shown.

145,663
DESIGN FOR A RIM BUTTON
Charles H. Frank, New Rochelle, N. Y.
Application June 19, 1946, Serial No. 130,863
Term of patent 7 years
(Cl. D17—2)

The ornamental design for a rim button, as shown.

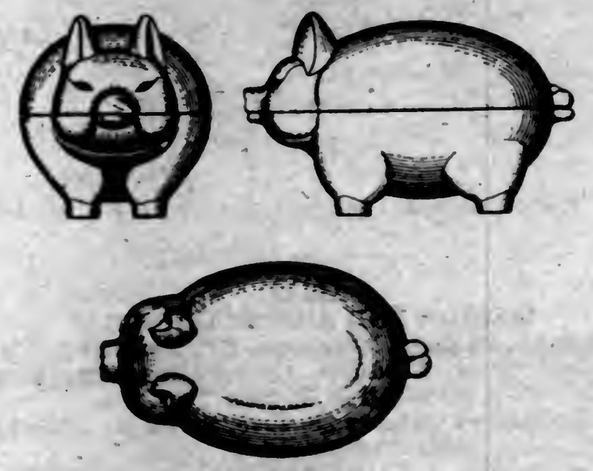
145,664
DESIGN FOR A HANDBAG FRAME
Charles W. Hardy, New York, N. Y.
Application November 15, 1945, Serial No. 123,758
Term of patent 7 years
(Cl. D83—2)

The ornamental design for a handbag frame, substantially as shown and described.

145,665
DESIGN FOR A BROOCH OR SIMILAR ARTICLE
Adolph Katz, Providence, R. I., assignor to Coro, Inc., New York, N. Y., a corporation of New York
Application February 23, 1946, Serial No. 126,834
Term of patent 7 years
(Cl. D45—19)

The ornamental design for a brooch or similar article, substantially as shown.

145,666
DESIGN FOR A BROOCH OR SIMILAR ARTICLE
Adolph Katz, Providence, R. I., assignor to Coro, Inc., New York, N. Y., a corporation of New York
Application February 23, 1946, Serial No. 126,844
Term of patent 7 years
(Cl. D45—19)

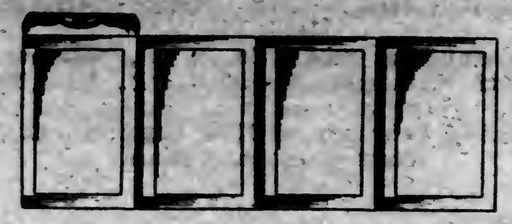


The ornamental design for a brooch or similar article, substantially as shown.

145,667
DESIGN FOR A BROOCH OR SIMILAR ARTICLE
Adolph Katz, Providence, R. I., assignor to Coro, Inc., New York, N. Y., a corporation of New York
Application February 23, 1946, Serial No. 126,845
Term of patent 7 years
(Cl. D45—19)

The ornamental design for a brooch or similar article, substantially as shown.

145,668
DESIGN FOR A CIGARETTE CONTAINER
George L. Kearney, Tuckahoe, N. Y.
Application March 29, 1945, Serial No. 118,769
Term of patent 14 years
(Cl. D85—2)



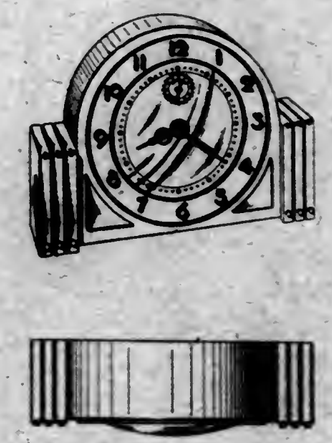
The ornamental design for a cigarette container, substantially as shown.

145,669
DESIGN FOR A FOLDING PICTURE FRAME OR SIMILAR ARTICLE
Ralph Kraus, New York, N. Y.
Application December 22, 1945, Serial No. 124,984
Term of patent 14 years
(Cl. D29—20)

145,669—Continued

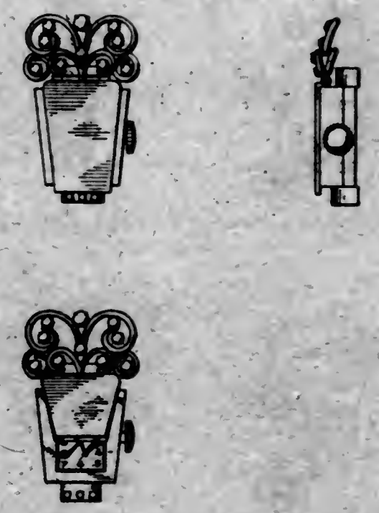
The ornamental design for a folding picture frame or similar article, substantially as shown.

145,670
DESIGN FOR A SHOE OR SIMILAR ARTICLE
Hans J. Kroto, Cambridge, Mass.
Application April 12, 1946, Serial No. 128,494
Term of patent 14 years
(Cl. D7—7)



The ornamental design for a shoe or similar article, substantially as shown and described.

145,671
DESIGN FOR A FABRIC
Lena Langer, New York, N. Y., assignor to Kaylon Incorporated, New York, N. Y., a corporation of New York
Application February 28, 1946, Serial No. 126,976
Term of patent 3½ years
(Cl. D92—1)



The ornamental design for a fabric, as shown and described.

145,672
DESIGN FOR AN ALARM CLOCK
Frederick Lux, Middlebury, Conn., assignor to The Lux Clock Manufacturing Company, Inc., Waterbury, Conn., a corporation of Connecticut
Application June 6, 1946, Serial No. 130,457
Term of patent 14 years
(Cl. D42—7)

The ornamental design for an alarm clock, as shown.

145,673
DESIGN FOR A WATCHCASE
Marianne Ostler, New York, N. Y.
Application February 26, 1946, Serial No. 126,906
Term of patent 7 years
(Cl. D42—8)

The ornamental design for a watchcase, as shown and described.

145,674
DESIGN FOR A WATCHCASE
Marianne Ostier, New York, N. Y.
Application February 26, 1946, Serial No. 126,907
Term of patent 7 years
(Cl. D42—8)

The ornamental design for a watchcase, as shown and described.

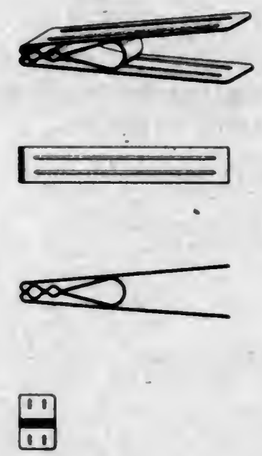
145,675
DESIGN FOR A WATCHCASE
Marianne Ostier, New York, N. Y.
Application February 26, 1946, Serial No. 126,908
Term of patent 7 years
(Cl. D42—8)

The ornamental design for a watchcase, as shown and described.

145,676
DESIGN FOR A BROOCH OR SIMILAR ARTICLE
Alfred Philippe, Scarsdale, N. Y., assignor to Trifari, Krussman & Fishel Inc., New York, N. Y.
Application February 26, 1946, Serial No. 126,924
Term of patent 7 years
(Cl. D45—19)

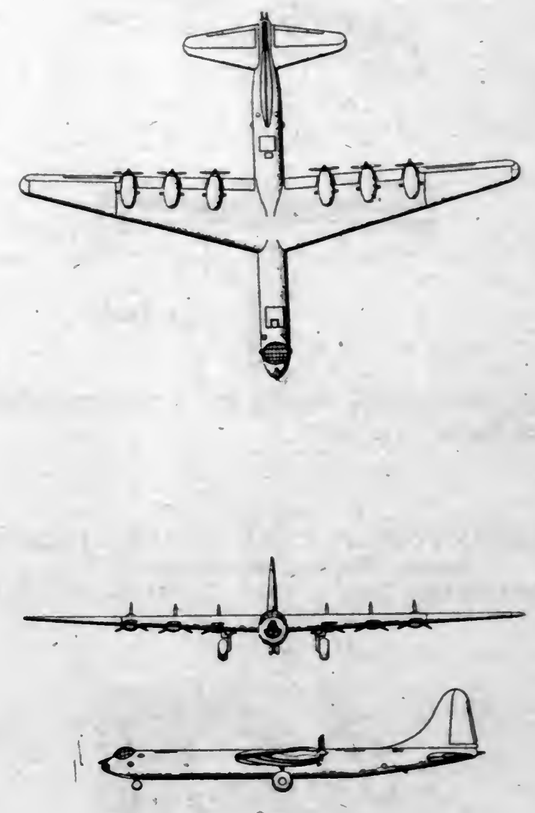
The ornamental design for a brooch or similar article, substantially as shown.

145,677
DESIGN FOR A TABLECLOTH OR SIMILAR ARTICLE
Ludwig G. Rohner, New York, N. Y.
Application June 22, 1946, Serial No. 130,947
Term of patent 3½ years
(Cl. D92—26)

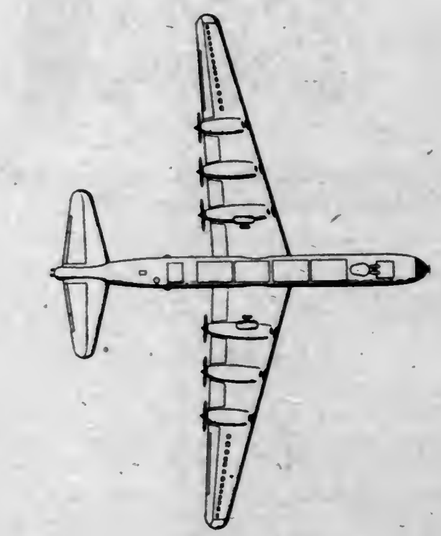


The ornamental design for a tablecloth or similar article, substantially as shown and described.

145,678
DESIGN FOR A CHAIR
Andrew Roth, Philadelphia, Pa., assignor to Bunting Glider Company, Philadelphia, Pa., a corporation of Pennsylvania
Application April 5, 1945, Serial No. 118,866
Term of patent 7 years
(Cl. D15—1)

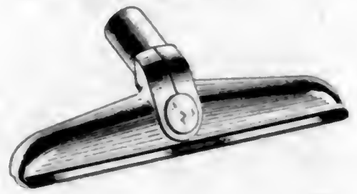


The ornamental design for a chair, as shown and described.

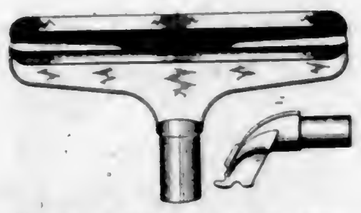


145,679
DESIGN FOR A CLOTHESPIN
Charles E. Seale, Jr., and Leslie W. Stinne, Dallas, Tex.
Application October 30, 1945, Serial No. 123,318
Term of patent 3½ years
(Cl. D17—6)

The ornamental design for a clothespin, as shown.

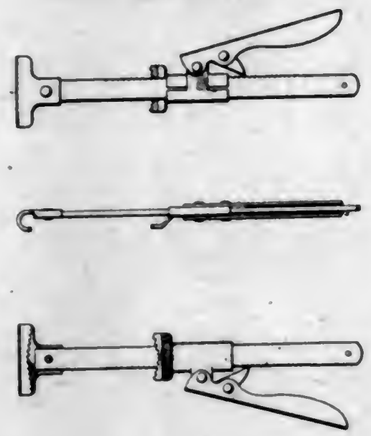


145,680
DESIGN FOR AN AIRPLANE
Raymond C. Sebold, Fort Worth, Tex., assignor to Consolidated Vultee Aircraft Corporation, San Diego, Calif., a corporation of Delaware
Application September 17, 1945, Serial No. 122,123
Term of patent 14 years
(Cl. D71—1)



The ornamental design for an airplane, substantially as shown.

145,681
DESIGN FOR A VACUUM CLEANER ATTACHMENT
Clifford Brooks Stevens, Milwaukee, Wis., assignor to Modern Hygiene, Inc., Boston, Mass., a corporation of Massachusetts
Application December 22, 1945, Serial No. 125,010
Term of patent 14 years
(Cl. D9—2)



The ornamental design for a vacuum cleaner attachment, as shown.

145,682
DESIGN FOR AN EMBROIDERED FABRIC
Anton Walter, New York, N. Y.
Application July 1, 1946, Serial No. 131,229
Term of patent 3½ years
(Cl. D92—1)

The ornamental design for an embroidered fabric, substantially as shown.

145,683
DESIGN FOR A JAR TOP WRENCH
George Yates, Glendale, Calif.
Application October 16, 1945, Serial No. 122,865
Term of patent 14 years
(Cl. D44—29)

The ornamental design for a jar top wrench, as shown.

145,684
DESIGN FOR A SHOE OR SIMILAR ARTICLE
Evelyn Ziniti, New York, N. Y.
Application May 10, 1946, Serial No. 129,541
Term of patent 7 years
(Cl. D7—7)

The ornamental design for a shoe or similar article, substantially as shown.

LIST OF TRADE-MARK APPLICANTS

PUBLISHED FOR OPPOSITION

LIST OF REISSUE PATENTEES

TO WHOM

PATENTS WERE ISSUED ON THE 1ST DAY OF OCTOBER, 1946

NOTE.—Arranged in accordance with the first significant character or word of the name (in accordance with city and telephone directory practice).

Board of Trustees of the Leland Stanford Junior University, The, assignee: *See*—
Hansen, William W., and R. H. and S. F. Varian.
Deakin, Gerald, assignor to International Standard Electric Corporation, New York, N. Y. Electrical control system for automatic telephone systems. Re. 22,794; Oct. 1.
Hansen, William W., and R. H. and S. F. Varian, Garden City, N. Y., assignors to The Board of Trustees of the Leland Stanford Junior University, Stanford University, Calif. High-frequency tube structure. Re. 22,795; Oct. 1.
Husted, Harry A., St. Clair, Mich. Combination fan and eyeshield. Re. 22,796; Oct. 1.
International Standard Electric Corporation, assignee: *See*—
Deakin, Gerald.
Maulsby, Leon K., and J. A. McGrann, San Antonio, Tex.; said McGrann assignor to said Maulsby. Nut cracking machine. Re. 22,797; Oct. 1.
McGrann, John A.: *See*—
Maulsby, Leon K., and McGrann.
Varian, Russell H.: *See*—
Hansen, William W., and R. H. and S. F. Varian.
Varian, Sigurd F.: *See*—
Hansen, William W., and R. H. and S. F. Varian.
Wolcott, Herbert, Columbia, Mo. Toggle fastening means for floating closures. Re. 22,798; Oct. 1.

LIST OF PLANT PATENTEES

Kellogg, R. M., Company, The, assignee: *See*—
Prushek, Emil.
Prushek, Emil, Berrien Springs, assignor to The R. M. Kellogg Company, Three Rivers, Mich. Chrysanthemum plant. 711; Oct. 1.

LIST OF DESIGN PATENTEES

Bach, Alfons, New York, N. Y. Piano. 145,648; Oct. 1.
Bach, Alfons, New York, N. Y. Piano. 145,649; Oct. 1.
Baer, Lena M., Topeka, Kans. Safety razor. 145,650; Oct. 1.
Bennett, Robert M., Downers Grove, Ill., assignor to Western Electric Company, Incorporated, New York, N. Y. Drafting table base. 145,651; Oct. 1.
Berger, Samuel I., Newark, N. J. Toy gun. 145,652; Oct. 1.
Binder, Leo J., Spokane, Wash. Combined coaster and ash tray holder. 145,653; Oct. 1.
Bjorksten, Johan, Chicago, Ill. Laboratory workbench. 145,654; Oct. 1.
Brantz, Louis P., Philadelphia, Pa. Chair cart. 145,655; Oct. 1.
Bunting Glider Company, assignee: *See*—
Roth, Andrew.
Calichio, John J., Forest Hills, N. Y. Letter opener. 145,656; Oct. 1.
Case, Frank P., assignor of one-half to H. A. Gosling, Chicago, Ill. Combined settee and telephone cabinet. 145,657; Oct. 1.
Clark, Clinton B., Oak Park, Ill. Overhead monorail train. 145,658; Oct. 1.
Consolidated Vultee Aircraft Corporation, assignee: *See*—
Sebold, Raymond C.
Coro, Inc., assignee: *See*—
Katz, Adolph.
Covington, James D., Dallas, assignor to Hilltop Manufacturing Company, Cockerell Hill, Tex. Combination desk and seat. 145,659; Oct. 1.
Culler, William H., San Marino, Calif. Tricycle. 145,660; Oct. 1.
Derham, Philip A., Rosemont, Pa., assignor to Victor Metal Products Corporation, Brooklyn, N. Y. Container cap. 145,661; Oct. 1.
Diamond, Freda, New York, assignor to Syracuse Ornamental Co., Syracuse, N. Y. Mirror frame or the like. 145,662; Oct. 1.
Frank, Charles H., New Rochelle, N. Y. Rim button. 145,663; Oct. 1.
Gosling, Henry A., assignee: *See*—
Case, Frank P.
Hardy, Charles W., New York, N. Y. Handbag frame. 145,664; Oct. 1.
Hilltop Manufacturing Company, assignee: *See*—
Covington, James D.
Katz, Adolph, Providence, R. I., assignor to Coro, Inc., New York, N. Y. Brooch or similar article. 145,665; Oct. 1.
Katz, Adolph, Providence, R. I., assignor to Coro, Inc., New York, N. Y. Brooch or similar article. 145,666; Oct. 1.
Katz, Adolph, Providence, R. I., assignor to Coro, Inc., New York, N. Y. Brooch or similar article. 145,667; Oct. 1.
Kaylon Incorporated, assignee: *See*—
Langer, Lena.
Kearney, George L., Tuckahoe, N. Y. Cigarette container. 145,668; Oct. 1.
Kraus, Ralph, New York, N. Y. Folding picture frame or similar article. 145,669; Oct. 1.
Kroto, Hans J., Cambridge, Mas. Shoe or similar article. 145,670; Oct. 1.
Langer, Lena, assignor to Kaylon Incorporated, New York, N. Y. Fabric. 145,671; Oct. 1.
Lux Clock Manufacturing Company, Inc., The, assignee: *See*—
Lux, Frederick.
Lux, Frederick, Middlebury, assignor to The Lux Clock Manufacturing Company, Inc., Waterbury, Conn. Alarm clock. 145,672; Oct. 1.
Modern Hygiene, Inc., assignee: *See*—
Stevens, Clifford B.
Ostier, Marianne, New York, N. Y. Watchcase. 145,673; Oct. 1.
Ostier, Marianne, New York, N. Y. Watchcase. 145,674; Oct. 1.
Ostier, Marianne, New York, N. Y. Watchcase. 145,675; Oct. 1.
Philippe, Alfred, Scarsdale, assignor to Trifari, Krussman & Fishel, Inc., New York, N. Y. Brooch or similar article. 145,676; Oct. 1.
Rohner, Ludwig G., New York, N. Y. Tablecloth or similar article. 145,677; Oct. 1.
Roth, Andrew, assignor to Bunting Glider Company, Philadelphia, Pa. Chair. 145,678; Oct. 1.
Seale, Charles E., Jr., and L. W. Stinne, Dallas, Tex. Clothespin. 145,679; Oct. 1.
Sebold, Raymond C., Fort Worth, Tex., assignor to Consolidated Vultee Aircraft Corporation, San Diego, Calif. Airplane. 145,680; Oct. 1.
Stevens, Clifford B., Milwaukee, Wis., assignor to Modern Hygiene, Inc., Boston, Mass. Vacuum cleaner attachment. 145,681; Oct. 1.
Stinne, Leslie W.: *See*—
Seale, Charles E., Jr., and Stinne.
Syracuse Ornamental Co., assignee: *See*—
Diamond, Freda.
Trifari, Krussman & Fishel, Inc., assignee: *See*—
Philippe, Alfred.
Victor Metal Products Corporation, assignee: *See*—
Derham, Philip A.
Walter, Anton, New York, N. Y. Embroidered fabric. 145,682; Oct. 1.
Western Electric Company, Incorporated, assignee: *See*—
Bennett, Robert M.
Yates, George, Glendale, Calif. Jar top wrench. 145,683; Oct. 1.
Ziniti, Evelyn, New York, N. Y. Shoe or similar article. 145,684; Oct. 1.

LIST OF PATENTEES

TO WHOM

PATENTS WERE ISSUED ON THE 1st DAY OF OCTOBER, 1946

NOTE.—Arranged in accordance with the first significant character or word of the name (in accordance with city and telephone directory practice).

Abbiati, Furio A.: *See*—
Healy, John J., Jr., Taylor, and Abbiati.

Adel Precision Products Corp., assignee: *See*—
Kehle, Ottmar A.
Morehouse, Eugene M.

Aeronautical & Mechanical Investments Limited, assignee: *See*—
Arnot, Alfred.

Agriculture, United States of America, as represented by Secretary of, assignee: *See*—
Gertler, Samuel I.

Air Reduction Company, Incorporated, assignee: *See*—
Van Nuys, Claude C.

Erickson, Arvid M., and Ryan.

Bartha, Sandor B., assignor to M. Galman, Philadelphia, Pa., trading as Imperial Lamp and Shade Company. Lamp shade and making the same. 2,408,594; Oct. 1.

Batcheider, Laurence, Cambridge, assignor, by mesne assignments, to Submarine Signal Company, Boston, Mass. Compressional wave transmitting and receiving apparatus. 2,408,404; Oct. 1.

Beale, Evelyn S. L., Staines, assignor to Alan Muntz & Company Limited, Hounslow, England. Oscillating fluid-displacing machines operating in parallel. 2,408,362; Oct. 1.

Beard, Chares L., Lancaster, Pa. Point marker. 2,408,595; Oct. 1.

Beckman, Charles E., and E. B. Dodds, Chicago, Ill., assignors to Better Packages, Inc., Shelton, Conn. Electrically controlled strip serving machine. 2,408,363; Oct. 1.

Bednar, Joseph J., and S. P. Peck, McKeesport, Pa., assignor to National Tube Company. Forming cylinder ends. 2,408,596; Oct. 1.

Belar, Herbert: *See*—
Sinnett, Chester M., and Belar.

Bell & Howell Company, The, assignee: *See*—
Brueske, George A.

Bell, Joseph D., San Francisco, Calif. Mechanical movement. 2,408,546; Oct. 1.

Bell Telephone Laboratories, Incorporated, assignee: *See*—
Bowen, Arnold E.
Clark, John W.
Hartley, Ralph V. L.
Maloney, Martin E.
Maithaner, William A.
Mason, Warren P.
McRae, James W.
Wise, Raymond O.

Belling, Theodore H., Barrington, R. I., assignor to Fram Corporation. Exercising device. 2,408,597; Oct. 1.

Belmont Radio Corporation, assignee: *See*—
Huff, John W.

Beltz, Lester L., assignor to Packard Motor Car Company, Detroit, Mich. Internal-combustion engine. 2,408,598; Oct. 1.

Bendix-Westinghouse Automotive Air Brake Company, assignee: *See*—
Ralston, James V.

Benioff, Hugo, La Canada, Calif., assignor, by mesne assignments, to Submarine Signal Company, Boston, Mass. Electrical apparatus. 2,408,405; Oct. 1.

Benioff, Hugo, La Canada, Calif., assignor, by mesne assignments, to Submarine Signal Company, Boston, Mass. Electrical apparatus. 2,408,406; Oct. 1.

Benioff, Hugo, La Canada, Calif., assignor, by mesne assignments, to Submarine Signal Company, Boston, Mass. High-frequency apparatus. 2,408,407; Oct. 1.

Bennett, Daniel A., and A. R. Maier, Oil City, Pa., assignors to Oil Well Supply Company. Rotary drilling unit. 2,408,364; Oct. 1.

Bennett, Edward H., Toledo, Ohio, assignor to Owens-Illinois Glass Company. Article transfer mechanism. 2,408,599; Oct. 1.

Berg, Clyde H. O., Long Beach, assignor to Union Oil Company of California, Los Angeles, Calif. Cracking process. 2,408,600; Oct. 1.

Bergel, Franz: *See*—
Avison, Anthony W. D., Bergel, and Haworth.

Bergstein, Frank D., trustee, assignee, et al.: *See*—
Bergstein, Samuel.

Bergstein, Robert M., trustee, assignee, et al.: *See*—
Bergstein, Samuel.

Bergstein, Samuel, Cincinnati, Ohio, assignor to R. M. and F. D. Bergstein, trustees. Coating webs. 2,408,504; Oct. 1.

Bertschinger, Frederick E., assignor to Standard Cabinet Works, Inc., Los Angeles, Calif. Coupling. 2,408,547; Oct. 1.

Better Packages, Inc., assignee: *See*—
Beckman, Charles E., and Dodds.

Biehl, Fred, and E. O. Thompson, Peshtigo, Wis; said Biehl assignor to said Thompson. Self-locking gearing. 2,408,365; Oct. 1.

Blauvelt, Benjamin, Paterson, N. J. Work illuminating tool. 2,408,601; Oct. 1.

Bloch, Herman S., Riverside, assignor to Universal Oil Products Company, Chicago, Ill. Isomerization of normally liquid hydrocarbons. 2,408,548; Oct. 1.

Bocjl Corporation, assignee: *See*—
Lang, Joseph C.

Bock, Ashley P., Catonsville, Md., assignor to Westinghouse Electric Corporation, East Pittsburgh, Pa. High voltage, high power concentric transmission line. 2,408,408; Oct. 1.

Boes, Floyd M., assignee: *See*—
Morris, Thomas L.

Borg-Warner Corporation, assignee: *See*—
Nutt, Harold.

Bowen, Arnold E., Red Bank, N. J., assignor to Bell Telephone Laboratories, Incorporated, New York, N. Y. Ultra high frequency electronic device. 2,408,409; Oct. 1.

Bowker, Harry Whalley, assignor to Baker Perkins Limited, Peterborough, England. Dough dividing machine. 2,408,602; Oct. 1.

Boyer, Hugh N., near Canfield, Ohio. Toggle bolt. 2,408,366; Oct. 1.

Braithwaite, Robert C., and K. Wilcox, Manchester, assignors to Metropolitan-Vickers Electrical Company Limited, London, England. Mechanical relay of the fluid jet. 2,408,603; Oct. 1.

Brandon, Clarence W., Newport, and G. M. Brandon, Tallahassee, Fla. Receptacle for fluids. 2,408,505; Oct. 1.

Brandon, George M.: *See*—
Brandon, Clarence W. and G. M.

Brennan, Joseph B., assignee: *See*—
Moynihan, John J.

Brickman, Alan E., New Haven, Conn., assignor to The American Steel and Wire Company of New Jersey. Torpedo net. 2,408,367; Oct. 1.

Brickman, Alan E., New Haven, Conn., assignor to The American Steel and Wire Company of New Jersey. Wire reinforced fabric. 2,408,368; Oct. 1.

Brickson, Thomas B., Hollywood, assignor to A. R. Brooks, Los Angeles, Calif. Crutch. 2,408,604; Oct. 1.

Briskin, Theodore S., J. C. Zivny, A. E. Schellschmidt, and J. J. Golick, assignors to Excel Auto Radiator Company, Chicago, Ill. Reversible clutch. 2,408,506; Oct. 1.

British Oxygen Company Limited, The, assignee: *See*—
Watts, Sidney S.

Brongersma, Cornelius, Muskegon Heights, assignor to Manning, Maxwell & Moore, Inc., Muskegon, Mich. Motor control. 2,408,369; Oct. 1.

Brookes, Charles F., Toronto, Ontario, Canada. Fuel heater for internal-combustion engines. 2,408,605; Oct. 1.

Brooks, Al R., assignee: *See*—
Brickson, Thomas B.

Brown, Clifford C., Clinton, Ohio. Steering drive mechanism for driven wheels. 2,408,507; Oct. 1.

Brueske, George A., Wayzata, Minn., assignor to The Bell & Howell Company, Chicago, Ill. Photographic camera. 2,408,549; Oct. 1.

Bruker, Hobart W., assignor to George W. Swift, Jr., Inc., Bordentown, N. J. Siphon mechanism for heated rolls. 2,408,606; Oct. 1.

Bruner-Ritter, Inc., assignee: *See*—
Mauch, Willy.

Buckley, Gerard D., Blackley, Manchester, England, assignor to Imperial Chemical Industries Limited. Manufacture of nitro compounds. 2,408,607; Oct. 1.

Buda Company, The, assignee: *See*—
Guerasimoff, Constantine N.

Burrill, Charles M., Princeton, N. J., assignor to Radio Corporation of America. Automatic tuning system for radio receivers. 2,408,370; Oct. 1.

Canavan, John P., Neenah, Wis. Nonchafing catamenial pad. 2,408,508; Oct. 1.

Capanoli, David M., Hibbing, Minn., now by judicial change of name D. M. Cappan. Cowling for airplanes. 2,408,371; Oct. 1.

Cappan, David M.: *See*—
Capanoli, David M.

Casablancas High Draft Company Limited, assignee: *See*—
Noguera, Joseph.

Cass, Oliver W., Niagara Falls, N. Y., assignor to E. I. du Pont de Nemours & Company, Wilmington, Del. Chlorinated resins. 2,408,608; Oct. 1.

Cass, Oliver W., Niagara Falls, N. Y., assignor to E. I. du Pont de Nemours & Company, Wilmington, Del. Resins of high chlorine content. 2,408,609; Oct. 1.

Cavanagh, John, assignor to Hat Corporation of America, Norwalk, Conn. Fabric hat and making the same. 2,408,610; Oct. 1.

Celanese Corporation of America, assignee: *See*—
Dodge, Frederick G.

Celotex Corporation, The, assignee: *See*—
Sorensen, Louis N.

Chase, Jesse D., Kansas City, Mo. Ladder extension. 2,408,372; Oct. 1.

Chatelain, Oscar: *See*—
Derungs, Ernest A., and Chatelain.

Cherry Rivet Company, assignee: *See*—
Keating, Herbert J.

Chu, Lan J., Brookline, Mass., assignor, by mesne assignments, to the Government of the United States of America, as represented by the Secretary of War. Antenna. 2,408,373; Oct. 1.

Clapsadle, Leo J., J. C. Kratzer, Kenmore, and E. E. Sommer, Larchmont, N. Y., assignors to The Linde Air Products Company. Cooling system for internal-combustion engines. 2,408,374; Oct. 1.

Clark, John W., Chatham, N. J., assignor to Bell Telephone Laboratories, Incorporated, New York, N. Y. Frequency converter. 2,408,410; Oct. 1.

Clark, Kendall, Oakwood, assignor to General Motors Corporation, Dayton, Ohio. Domestic appliance. 2,408,509; Oct. 1.

Collins, Clarence P., Titusville, Pa. Magnetic motor. 2,408,375; Oct. 1.

Consolidated Vultee Aircraft Corporation, assignee: *See*—
Flood, Edmund L.

Cooke, William T.: *See*—
Jenks, Frederic A., Folland, Maeder, and Cooke.

Craig, Charles C., Morrill, Nebr. Automobile jack. 2,408,376; Oct. 1.

Crane, Theodore D., Council Bluffs, Iowa. Bed service set. 2,408,550; Oct. 1.

Crown Cork & Seal Company, Inc., assignee: *See*—
Lauve, Louis L.
Rau, Harry A.

Crown Zellerbach Corporation, assignee: *See*—
Harris, Jesse A.

Curry, Robert S., Jr., Baldwin, N. Y., assignor to Sperry Gyroscope Company, Inc. Erecting means for gyro vertical instruments. 2,408,411; Oct. 1.

Cutler-Hammer, Inc., assignee: *See*—
Wirtzmann, Alex A.

Dangelmajer, Charles, Nutley, assignor to Resistoflex Corporation, Belleville, N. J. Polyvinyl alcohol composition. 2,408,377; Oct. 1.

Davenport, James E., and L. J. Quinn, Richmond, Calif.; said Quinn assignor to said Davenport. Stabilizer attachment for cranes. 2,408,378; Oct. 1.

Davidoff, Isidore, assignee: *See*—
McClure, Chauncy H.

Dawson, Albert, Tarentum, Pa. Holder for containers. 2,408,611; Oct. 1.

Day, Luther F., Hawthorne, Calif., assignor to North American Aviation, Inc. Press. 2,408,379; Oct. 1.

Dennis, Luther D., Comanche, Okla., assignor, by mesne assignments, to Portable Elevator Mfg. Co., Bloomington, Ill. Bottle dispensing apparatus. 2,408,380; Oct. 1.

Derungs, Ernest A., and O. Chatelain, Le Locle, Switzerland. Escapement adjusting device. 2,408,612; Oct. 1.

Designers for Industry, Inc., assignee: *See*—
Lee, Asa R.

Dickinson, Arthur H., Scarsdale, assignor to International Business Machines Corporation, New York, N. Y. Electrical system. 2,408,613; Oct. 1.

Dimmick, Glenn L., Indianapolis, Ind., assignor to Radio Corporation of America. Surface coating apparatus. 2,408,614; Oct. 1.

Distillation Products, Inc., assignee: *See*—
Hickman, Kenneth C. D.

Dobbins, Horace M., Pasadena, Calif. Propulsion and stabilization of watercraft and the like. 2,408,412; Oct. 1.

Dodds, Earl B.: *See*—
Beckman, Charles E., and Dodds.

Dodge, Frederick G., La Vale, Md., assignor to Celanese Corporation of America. Resilient filaments. 2,408,381; Oct. 1.

Doherty, William H., Elmhurst, N. Y. Supporting frame for articles of footwear. 2,408,413; Oct. 1.

Donaldson, Charles A., Del Rio, Tex. Absolute altimeter. 2,408,414; Oct. 1.

Donaldson, Charles A., Del Rio, Tex. Distance gauging and like apparatus. 2,408,415; Oct. 1.

Draper Corporation, assignee: *See*—
Hamilton, Wallace.

Dubick, Michael, assignor to The Englander Company, Inc., Chicago, Ill. Mattress. 2,408,382; Oct. 1.

Dudley, James R., Cos Cob, Conn., assignor to American Cyanamid Company, New York, N. Y. Cation exchange resins and production thereof. 2,408,615; Oct. 1.

Du Pont, E. I., de Nemours & Company, assignee: *See*—
Arnold, Harold W.
Cass, Oliver W.
Edgar, Donald E., and Sullivan.
Gilbert, Harvey N.
Iler, Ralph K., and Kirk.
Johnston, Frederick L.
Kirk, Joseph S.
Tauch, Ernest J.

Eaton Manufacturing Company, assignee: *See*—
Witchger, Eugene S.

Edgar, Donald E., Westport, and D. J. Sullivan, Fairfield, Conn., assignors to E. I. du Pont de Nemours & Company, Wilmington, Del. Semiconducting composition. 2,408,416; Oct. 1.

Eldredge, Elmer E., Plymouth, Wis., assignor to Kraft Foods Company. Packaging. 2,408,616; Oct. 1.

Ellenbogen, William C., York, Pa. Tanning agents and treating hides and skins therewith. 2,408,417; Oct. 1.

Englander Company, Inc., The, assignee: *See*—
Dubick, Michael.

Erickson, Arvid M., San Jose, and J. D. Ryan, Campbell, assignors to Barron-Gray Packing Company, San Jose, Calif. Fruit treatment. 2,408,418; Oct. 1.

Evans, John, Palmyra, N. J., assignor to Radio Corporation of America. Electric discharge device. 2,408,383; Oct. 1.

Excel Auto Radiator Company, assignee: *See*—
Briskin, Theodore S., Zivny, Schellschmidt, and Golick.

Farrell, Robert W., New York, N. Y. Film viewing device. 2,408,384; Oct. 1.

Feldmann, Fred F., San Jose, Calif. Nut cracking machine. 2,408,510; Oct. 1.

Ferrar, Bernard, Chicago, Ill. Foot appliance. 2,408,617; Oct. 1.

Fielding, David T. E., Middleton Junction, England. Machine for grinding drills and similar tools. 2,408,618; Oct. 1.

Flood, Edmund L., assignor to Consolidated Vultee Aircraft Corporation, San Diego, Calif. Drill lubricant. 2,408,385; Oct. 1.

Folland, Donald F.: *See*—
Jenks, Frederic A., Folland, Maeder, and Cooke.

Foster, James L., Wichita Falls, Tex. Well explosive device. 2,408,419; Oct. 1.

Fram Corporation, assignee: *See*—
Beiling, Theodore H.

Frank, Louis, Fellows, Calif. Self-latching electric plug. 2,408,551; Oct. 1.

Friedlander, Erwin F., assignor to O. & F. Company Proprietary Limited, Hobart, Tasmania, Australia. Arc welding electrodes. 2,408,619; Oct. 1.

Friedlander, Erwin F., assignor to O. & F. Company Proprietary Limited, Hobart, Tasmania, Australia. Arc welding electrodes. 2,408,620; Oct. 1.

Froelich, Herman C., Cleveland, Ohio, assignor to General Electric Company. Phosphors and their stabilization. 2,408,621; Oct. 1.

Fuller, Frederick L., deceased, West Orange, by S. B. Harrison, East Orange, N. J., and J. G. Phillips, executors, assignors to International Business Machines Corporation, New York, N. Y. Printing machine. 2,408,622; Oct. 1.

Fulton Company, The, assignee: *See*—
Riemann, Howard C., and Thorp.

Furry, John F., assignor to Outboard, Marine & Manufacturing Company, Galesburg, Ill. Engine and engine cooling method. 2,408,386; Oct. 1.

Gallant, Charles J.: *See*—
Gilium, Donald E., and Gallant.

Galman, Max, assignee: *See*—
Bartha, Sandor B.

Gammeter, John R., Akron, Ohio. Ball-winding machine. 2,408,552; Oct. 1.

Gay, Harry S., Mount Gay, and T. V. Maynard, Williamson, W. Va. Timber setting machine. 2,408,387; Oct. 1.

General Aniline & Film Corporation, assignee: *See*—
Grimmel, Harry W., and Guenther.
Guenther, Alfred, and Morgan.

General Electric Company, assignee: *See*—
Froelich, Herman C.
Lyon, Kenneth C.
Malloy, John J.
Merrill, George S.
Nickle, Clifford A.
Noel, Edward B., and Seitz.
Sprung, Murray M.
Townsend, Mark A.

General Motors Corporation, assignee: *See*—
Clark, Kendall.

George, Harry F., Chicago, Ill. Steering wheel. 2,408,388; Oct. 1.

Gertler, Samuel I., Washington, D. C., assignor to United States of America, as represented by Secretary of Agriculture. N,N-diethylbenzamide as an insect repellent. 2,408,389; Oct. 1.

Gessler, Frederick A., assignor, by mesne assignments, to Globe Milker, Inc., Des Moines, Iowa. Teat cup for milking machines. 2,408,390; Oct. 1.

Gibbs, Carlin F., Cuyahoga Falls, Ohio, assignor to The B. F. Goodrich Company, New York, N. Y. Ketone aminoindan condensation product. 2,408,391; Oct. 1.

Gibson Refrigerator Company, assignee: *See*—
Rosebrook, Homer E., and Powell.

Gieskieng, Marion W. and W. A., Denver, Colo. Railway wheel checking device. 2,408,553; Oct. 1.

Gieskieng, William A.: *See*—
Gieskieng, Marion W. and W. A.

Gilbert, Harvey N., Niagara Falls, N. Y., assignor to E. I. du Pont de Nemours & Company, Wilmington, Del. Coating ferrous metals with molten aluminum. 2,408,623; Oct. 1.

Gilium, Donald E., Hermosa Beach, and C. J. Gallant, Brentwood Heights, assignors to North American Aviation, Inc., Inglewood, Calif. Vibrometer. 2,408,392; Oct. 1.

Ginger-Cola Dispenser, Inc., assignee: *See*—
Lloyd, Charles W.

Ginzton, Edward L., Garden City, N. Y., assignor to Sperry Gyroscope Company, Inc. Frequency multiplier. 2,408,420; Oct. 1.

Gits, Joseph A. and J. P., Chicago, Ill. Flashlight. 2,408,393; Oct. 1.

Gits, Jules P.: *See*—
Gits, Joseph A. and J. P.

Globe Milker, Inc., assignee: *See*—
Gessler, Frederick A.

Goepfrich, George A., South Bend, Ind. Gun charger. 2,408,624; Oct. 1.

Golick, Julian J.: *See*—
Briskin, Theodore S., Zivny, Schellschmidt, and Golick.

Goodrich, B. F., Company, The, assignee: *See*—
Gibbs, Carlin F.
Krotz, Alvin S.

Gothard, Thomas J., Los Angeles, Calif. Fog nozzle. 2,408,511; Oct. 1.

Gradisar, Alvin A., Buffalo, N. Y., assignor, by mesne assignments, to American Optical Company, Southbridge, Mass. Device for forming slits. 2,408,512; Oct. 1.

Graham, William R., Jr., Kansas City, G. O. Kohler, Mission, Kans., and R. D. Hoover, assignors to American Dairies Incorporated, Kansas City, Mo., and The Quaker Oats Company, Chicago, Ill. Separating chlorophyll from vitamins and other fat soluble materials. 2,408,625; Oct. 1.

Green, Lee B., Lakewood, Ohio. Protecting originative matter. 2,408,626; Oct. 1.

Green, Lee B., Lakewood, Ohio. Apparatus for extruding. 2,408,627; Oct. 1.

Green, Lee B., Lakewood, Ohio. Rail fastening. 2,408,628; Oct. 1.

Green, Lee B., Lakewood, Ohio. Molding apparatus and method. 2,408,629; Oct. 1.

Green, Lee B., Lakewood, Ohio. Apparatus for molding plastic material. 2,408,630; Oct. 1.

Greenfield, Max, Brooklyn, N. Y. Bow tie device. 2,408,631; Oct. 1.

Griffith, Alan A., assignor to Rolls-Royce Limited, Derby, England. Fluid-solid contact surface. 2,408,632; Oct. 1.

Grimmel, Harry W., Easton, and A. Guenther, Riegelsville, Pa., assignors to General Aniline & Film Corporation, New York, N. Y. Water insoluble azo dyestuffs containing an n-morpholino-arylide group. 2,408,421; Oct. 1.

Guenther, Alfred: *See*—
Grimmel, Harry W., and Guenther.

Guenther, Alfred, Riegelsville, Pa., and J. F. Morgan, Phillipsburg, N. J., assignors to General Aniline & Film Corporation, New York, N. Y. Production of substituted quinazolones from organic phosphazo compounds. 2,408,633; Oct. 1.

Guerasimoff, Constantine N., assignor to The Buda Company, Harvey, Ill. Diesel engine and operating same. 2,408,394; Oct. 1.

Gunderson, Ralph R., Chicago, Ill. Fluid pressure producing device. 2,408,513; Oct. 1.

Hagen, Harry W., Decatur, Ill. Bottle closure to render bottles nonrefillable. 2,408,634; Oct. 1.

Haight, John L., Jr., Fort Worth, Tex. Internal-combustion engine. 2,408,554; Oct. 1.

Hall, John M., New York, N. Y. Ice air conditioning system. 2,408,635; Oct. 1.

Hamilton, Wallace, Albany, N. Y., assignor to Draper Corporation, Hopedale, Mass. Picker stick checking mechanism. 2,408,636; Oct. 1.

Harris, Jesse A., West Linn, Oreg., assignor to Crown Zellerbach Corporation, San Francisco, Calif. Preparing and applying a patch for a fourdrinier wire. 2,408,422; Oct. 1.

Harrison, Schuyler B., executor, et al.: *See*—
Fuller, Frederick L.

Hart, Edward, San Marino, Calif., assignor to A. O. Smith Corporation, Milwaukee, Wis. Double-casing high-pressure pump. 2,408,637; Oct. 1.

Hart, Geo. B., Inc., assignee: *See*—
Hart, Richard C.

Hart, Richard C., Fairport, assignor to Geo. B. Hart, Inc., Rochester, N. Y. Greenhouse roof bar cleaning brush. 2,408,555; Oct. 1.

Harter, C. B., assignee et al.: *See*—
Howard, Posy A.

Hartley, Ralph V. L., Summit, N. J., assignor to Bell Telephone Laboratories, Incorporated, New York, N. Y. High frequency amplifying apparatus. 2,408,423; Oct. 1.

Hasenwinkle, Carl A., Bison, S. Dak. Safety plug-in connector. 2,408,556; Oct. 1.

Hat Corporation of America, assignee: *See*—
Cavanagh, John.

Haux, Elmer H., Baltimore, Md., assignor to Pittsburgh Plate Glass Company, Allegheny County, Pa. High capillarity bristle. 2,408,718; Oct. 1.

Haworth, John W.: *See*—
Avison, Anthony W. D., Bergel, and Haworth.

Hays, James B., Jr., Summit, N. J., assignor, by mesne assignments, to Western Electric Company, Incorporated, New York, N. Y. Object locating system. 2,408,395; Oct. 1.

Hazelett, Clarence W., Greenwich, Conn. Metalworking process and apparatus. 2,408,514; Oct. 1.

Healy, John J., Jr., Brookline, M. H. Taylor, Stoneham, and F. A. Abbiati, Longmeadow, Mass., assignors to Monsanto Chemical Company, St. Louis, Mo. Pickling steels. 2,408,424; Oct. 1.

Hedgecock, Stanley, Wood Green, assignor to Laystall Engineering Company Limited, London, England. Apparatus for controlling power transmission systems. 2,408,638; Oct. 1.

Heijn, Paul C.: *See*—
Osterberg, Harold, Pride, and Heijn.

Helders, Richard C.: *See*—
King, Edward F.

Hemphill Company, assignee: *See*—
Smith, Norman H.

Hickman, Kenneth C. D., assignor to Distillation Products, Inc., Rochester, N. Y. Vacuum distillation process and apparatus. 2,408,639; Oct. 1.

Hilton, Charles G., Amarillo, Tex. Combined bootjack and boot hook. 2,408,640; Oct. 1.

Hitchcock, Stanley I., assignor to Tropical Plantations Limited, London, England. Dynamoelectric machine. 2,408,641; Oct. 1.

Hockery, John C., assignee, et al.: *See*—
Talge, Henry J., and Landry.

Hoffmann-La Roche Inc., assignee: *See*—
Karrer, Paul.

Hoover, Richard D.: *See*—
Graham, William R., Jr., Kohler, and Hoover.

Hopkins, Arthur G., Maspeth, Long Island, N. Y. Tin depositing process. 2,408,515; Oct. 1.

Hoppe, Bernard, and C. J. Smithells, assignors to Lodge Plugs Limited, Rugby, England. Sparking plug. 2,408,642; Oct. 1.

Horsley, George F., Norton-on-Tees, England, assignor to Imperial Chemical Industries Limited. Activating catalysts. 2,408,296; Oct. 1.

Horton, Erwin C., Hamburg, assignor to Trico Products Corporation, Buffalo, N. Y. Marking machine. 2,408,516; Oct. 1.

Howard, Carroll: *See*—
Miller, Robert A., and Howard.

Howard, Posy A., assignor of one-half to C. A. Mathey and one-half to C. B. Harter, Tulsa, Okla. Pipe-cutting apparatus. 2,408,517; Oct. 1.

Hoy, Joseph A., Hialeah, Fla. Safety flashlight for pedestrians and bicycle riders. 2,408,643; Oct. 1.

Huff, John W., assignor, by mesne assignments, to Belmont Radio Corporation, Chicago, Ill. Combined amplitude-modulation and frequency-modulation receiver stage. 2,408,644; Oct. 1.

Hunt, John O., assignor to Mountain City Foundry and Machine Co., Greenville, S. C. Loom. 2,408,645; Oct. 1.

Huntington, Glen H., Denver, Colo. Sheet metal roofing. 2,408,557; Oct. 1.

Huntley, James R., Hicksville, N. Y. Machine tool. 2,408,646; Oct. 1.

Huntsicker, Harry N., Evanston, and C. R. Norman, Jr., assignors to United States Gypsum Company, Chicago, Ill. Manufacture of hydrated lime. 2,408,647; Oct. 1.

Hutchison, Frank E., Houston, Tex. Mud screen. 2,408,558; Oct. 1.

Iler, Ralph K., Cleveland Heights, and J. S. Kirk, Seven Hills Village, Ohio, assignors to E. I. du Pont de Nemours & Company, Wilmington, Del. Silicic acid compositions. 2,408,655; Oct. 1.

Imperial Chemical Industries Limited, assignee: *See*—
Buckley, Gerard D.
Horsley, George F.

Inman, Clark H., Lakewood, N. J. Apparatus for cleaning eggs and the like. 2,408,648; Oct. 1.

Inspiration Consolidated Copper Company, assignee: *See*—
Mason, William C.

International Business Machines Corporation, assignee: *See*—
Dickinson, Arthur H.
Fuller, Frederick L.
King, Benjamin F.
Wilkerson, Victor O.

Jack & Heintz Precision Industries, Inc., assignee: *See*—
Seme, John J.

Jackson, Arthur R., Mill Hill, England. Aircraft having moving airfoil or wing. 2,408,649; Oct. 1.

Jarvis, Nathan, assignee, et al.: *See*—
Schonthal, Leopold.

Jeffrey Manufacturing Company, The, assignee: *See*—
Wright, Fred J.

Jenkins Petroleum Process Company, assignee: *See*—
Smith, Arthur D.

Jenks, Frederic A., Mineola, D. F. Folland, Hempstead, A. S. Maeder, Scarsdale, and W. T. Cooke, Huntington, assignors to Sperry Gyroscope Company, Inc., Brooklyn, N. Y. Instrument landing system. 2,408,425; Oct. 1.

Jennings, George H., Cincinnati, Ohio. Water-resistant shoe. 2,408,650; Oct. 1.

Johnson, C. S., Company, The, assignee: *See*—
Johnson, Charles H.

Johnson, Charles H., assignor to The C. S. Johnson Company, Champaign, Ill. Mixing plant. 2,408,397; Oct. 1.

Johnson, Theodore L., St. Louis, Mo. Multiple extrusion. 2,408,398; Oct. 1.

Johnston, Frederick L., Claymont, assignor to E. I. du Pont de Nemours & Company, Wilmington, Del. Preparation of modified methyl methacrylate compositions. 2,408,426; Oct. 1.

Joy Manufacturing Company, assignee: *See*—
Osgood, Charles F.

Kadenacy, Michel, Summit, N. J. Internal-combustion engine. 2,408,399; Oct. 1.

Kalitinsky, Andrew, Englevillle, assignor to United Aircraft Corporation, East Hartford, Conn. Cylinder construction. 2,408,427; Oct. 1.

Karrer, Paul, Zurich, Switzerland, assignor to Hoffmann-La Roche Inc., Nutley, N. J. Thiophan-3-one and manufacture of same. 2,408,518; Oct. 1.

Keating, Herbert J., Pasadena, assignor to Cherry Rivet Company, Los Angeles, Calif. Self-setting tubular rivet. 2,408,559; Oct. 1.

Keahn, Warner L., Spokane, Wash. Plate clamp. 2,408,560; Oct. 1.

Keehn, Warner L., Spokane, Wash. Dual axle trailer. 2,408,561; Oct. 1.

Kehle, Ottmar A., West Los Angeles, Calif., assignor to Adel Precision Products Corp. Flow control valve. 2,408,562; Oct. 1.

Kent, Henry, New York, N. Y. Flint alloy. 2,408,400; Oct. 1.

Kiebl, Ralph A., San Diego, Calif. World globe and scale. 2,408,651; Oct. 1.

King, Benjamin F., Endicott, assignor to International Business Machines Corporation, New York, N. Y. Center drill chuck. 2,408,652; Oct. 1.

King, Edward F., Oak Park, assignor of one-half to R. C. Hehlers, Chicago, Ill. Vehicle trailer. 2,408,401; Oct. 1.

Kinne, Edmund P., Alliance, Ohio, assignor to American Steel Foundries, Chicago, Ill. Coupler. 2,408,653; Oct. 1.

Kirk, Joseph S.: *See*—
Iler, Ralph K., and Kirk.

Kirk, Joseph S., Seven Hills Village, Ohio, assignor to E. I. du Pont de Nemours & Company, Wilmington, Del. Silicic acid sols. 2,408,654; Oct. 1.

Kirk, Joseph S., Seven Hills Village, Ohio, assignor to E. I. du Pont de Nemours & Company, Wilmington, Del. Process for producing silicic acid sols. 2,408,656; Oct. 1.

Kobe, Inc., assignee: *See*—
Mestas, Ricardo.

Kohler, George O.: *See*—
Graham, William R., Jr., Kohler, and Hoover.

Kraft Foods Company, assignee: *See*—
Eldredge, Elmer E.

Krasberg, Rudolf, Chicago, Ill. Hair curler. 2,408,657; Oct. 1.

Kratzer, James C.: *See*—
Clapsadle, Lee J., Dratzer, and Sommer.

Krotz, Alvin S., Akron, Ohio, assignor to The B. F. Goodrich Company, New York, N. Y. Truck for rail vehicles. 2,408,520; Oct. 1.

Kurzweil, Robert, Kew Gardens, assignor to Morey Machinery Co., Inc., Astoria, Long Island, N. Y. Turret lathe headstock. 2,408,658; Oct. 1.

Kuzmitz, Frank V.: *See*—
Pontius, George W., III, Wilson, and Kuzmitz.

La Frenier, John, Detroit, Mich. Suspender. 2,408,464; Oct. 1.

Lamb, Charles G., Elmhurst, Ill. Air filter. 2,408,659; Oct. 1.

Landry, William J.: *See*—
Talge, Henry J., and Landry.

Lang, Joseph C., Pittsburgh, Pa., assignor to Bocji Corporation. Stapling machine and method. 2,408,563; Oct. 1.

Lanuge, Birger A., Rasunda, Sweden. Remote indication system. 2,408,660; Oct. 1.

Lapointe, Francis J., assignor to American Broach & Machine Co., Ann Arbor, Mich. Broaching machine. 2,408,521; Oct. 1.

Lauve, Louis L., assignor to Crown Cork & Seal Company, Inc., Baltimore, Md. Container cap. 2,408,465; Oct. 1.

Laystall Engineering Company Limited, assignee: *See*—
Hedgecock, Stanley.

Lea, Harlan L., Racine, Wis. Attachment for stadium boots. 2,408,564; Oct. 1.

Leaf, Walter B., Denver, Colo. Retarding cinder cutting. 2,408,428; Oct. 1.

Lee, Asa R., assignor to Designers for Industry, Inc., Cleveland, Ohio. Air-speed indicator. 2,408,661; Oct. 1.

Leef, David, Bronx, N. Y. Lamp harp. 2,408,522; Oct. 1.

Le Tourneau, R. G., Inc., assignee: *See*—
Akers, Richard L.
Wyman, Floyd H., and Malik.

Levesque, Bernard T., Wenham, Mass., assignor to United Shoe Machinery Corporation, Flemington, N. J. Presser foot mechanism for sewing machines. 2,408,523; Oct. 1.

Levey, Harold A., assignor to A. C. Patterson, New Orleans, La. Smoke screen composition and developing smoke screens therefrom. 2,408,429; Oct. 1.

Levitt, Benjamin A., Newark, N. J., assignor to A. L. Siegel Co. Inc., New York, N. Y. Rain protective garment. 2,408,662; Oct. 1.

Lewis, William H., Cwmllynfell, Swansea, South Wales. Stud or protector for boots and shoes. 2,408,663; Oct. 1.

Libbey-Owens-Ford Glass Company, assignee: *See*—
Rodman, Frank A.
Simons, John K., and Weaver.
Watkins, George B., and Schafer.

Lieblein, Chaim, Brooklyn, N. Y. Detachable screw-cutting disk and tool shank. 2,408,565; Oct. 1.

Linde Air Products Company, The, assignee: *See*—
Clapsadle, Lee J., Kratzer, and Sommer.

Lloyd, Charles W., assignor to Ginger-Cola Dispenser, Inc., Brooklyn, N. Y. Mixing faucet for beverages. 2,408,664; Oct. 1.

Lodge Plugs Limited, assignee: *See*—
Hoppe, Bernard, and Smithells.

Losey Products Co., assignee: *See*—
Babson, Henry B., and Thomas.

Lovely, Elmer R., Glastonbury, Conn. Chimney top. 2,408,665; Oct. 1.

Lowe, Robert, assignee: *See*—
McFarlane, Arthur B.

Lowey, Francis J., Bay Village, and C. H. Tower, assignors to The S. K. Wellman Company, Cleveland, Ohio. Friction composition product. 2,408,430; Oct. 1.

Lutes, Oakley D., Jackson, Mich., assignor to Seiden Pneumatic Tool Company. Blind riveting apparatus. 2,408,431; Oct. 1.

Lyon, Kenneth C., Millville, N. J., assignor to General Electric Company. Glass composition. 2,408,468; Oct. 1.

Lyons, Ellis C., Boulder City, Nev., assignor, by mesne assignments, to Reconstruction Finance Corporation. Melting magnesium metal and the like. 2,408,466; Oct. 1.

Lyons, Ellis C., Boulder City, Nev., assignor, by mesne assignments, to Reconstruction Finance Corporation. Conditioning molten metal. 2,408,467; Oct. 1.

Maeder, Abbott S.: *See*—
Jenks, Frederic A., Folland, Maeder, and Cooke.

Maier, August R.: *See*—
Bennett, Daniel A., and Maier.

Mallory, Marion, Detroit, Mich. Free-wheeling device for automotive vehicles. 2,408,566; Oct. 1.

Malloy, John J., Cleveland Heights, Ohio, assignor to General Electric Company. Multiflash lamp device. 2,408,469; Oct. 1.

Maloney, Martin E., Flushing, assignor to Bell Telephone Laboratories, Incorporated, New York, N. Y. Telephone system. 2,408,432; Oct. 1.

Malthaner, William A., assignor to Bell Telephone Laboratories, Incorporated, New York, N. Y. Telephone system. 2,408,433; Oct. 1.

Mann, Julius W., and G. F. Russell, Tacoma, Wash. Method and apparatus for drying materials uniformly throughout their mass. 2,408,434; Oct. 1.

Manning, Maxwell & Moore, Inc., assignee: *See*—
Brongersma, Cornelius.

Martin, Philip, Camarillo, Calif. Thermostat controlled alarm. 2,408,667; Oct. 1.

Mason, Warren P., West Orange, N. J., assignor to Bell Telephone Laboratories, Incorporated, New York, N. Y. Pipe antenna and prism. 2,408,435; Oct. 1.

Mason, Warren P., West Orange, N. J., assignor to Bell Telephone Laboratories, Incorporated, New York, N. Y. Multiplex compressional wave system. 2,408,436; Oct. 1.

Mason, William C., Inspiration, Ariz., assignor to Inspiration Consolidated Copper Company. Electrolysis of copper. 2,408,668; Oct. 1.

Mathey, C. A., assignee, et al.: *See*—
Howard, Posy A.

Mattson, Leslie N., Paulsboro, N. J. Combination switch and light control for floor lamps. 2,408,669; Oct. 1.

Mauch, Willy, Bridgeport, Conn., assignor to Burner-Ritter, Inc., New York, N. Y. Tool holder. 2,408,567; Oct. 1.

Maynard, Thomas V.: *See*—
Gay, Harry S., and Maynard.

McBee Company, The, assignee: *See*—
Welk, Nelson S.

McClure, Chauncey H., assignor of one-half to I. Davidoff, Milwaukee, Wis. Low voltage flasher. 2,408,568; Oct. 1.

McDermott, Henry J., Prospect Park, Pa., assignor to American Viscose Corporation, Wilmington, Del. Spinning bucket assembly. 2,408,670; Oct. 1.

McFarlane, Arthur B., Harrow, assignor of one half to R. Lowe, Bexley Heath, England. Earth moving machine. 2,408,671; Oct. 1.

McRae, James W., Neptune, N. J., assignor to Bell Telephone Laboratories, Incorporated, New York, N. Y. Harmonic generating system. 2,408,437; Oct. 1.

Mead, Charles M., Los Angeles, Calif. Shirt collar holder. 2,408,569; Oct. 1.

Mennesson, Marcel, assignor to Societe Anonyme Pour La Construction de Materiel Automobile (S. A. C. M. A.), Neuilly-sur-Seine (Seine) France. Apparatus for measuring or checking transverse dimensions. 2,408,672; Oct. 1.

Merrill, George S., Cleveland, Ohio, assignor to General Electric Company. Illuminating apparatus. 2,408,471; Oct. 1.

Mestas, Ricardo, Los Angeles, assignor to Kobe, Inc., Huntington Park, Calif. Electric gauge. 2,408,524; Oct. 1.

Metals and Controls Corporation, assignee: *See*—
Moorhead, John O.

Metropolitan-Vickers Electrical Company, Limited, assignee: *See*—
Braithwaite, Robert C., and Wilcox.
Todd, Keith W.

Michael, Leonard U., Montreal, Quebec, Canada. Turndown shirt collar. 2,408,570; Oct. 1.

Miller, Joseph: *See*—
Newman, Edwin B., and Miller.

Miller, Robert A., Tarentum, and C. Howard, Rochester, Pa., assignors to Pittsburgh Plate Glass Company. Folding door. 2,408,525; Oct. 1.

Mills, Bert E., Oak Park, assignor to Mills Novelty Company, Chicago, Ill. Film cleaning device. 2,408,438; Oct. 1.

Mills Novelty Company, assignee: *See*—
Mills, Bert E.

Minneapolis-Honeywell Regulator Company, assignee: *See*—
Sparrow, Hubert T.

Minton, Gerald Z., Tarentum, assignor to Pittsburgh Plate Glass Company, Allegheny County, Pa. Glass supporting skeleton mold. 2,408,526; Oct. 1.

Mitchell, Hubert L., Houston, Tex. Navigational computing instrument. 2,408,571; Oct. 1.

Monsanto Chemical Company, assignee: *See*—
Healy, John J., Jr., Taylor, and Abbiati.
Seymour, Raymond B.

Monson, Louis T., Alhambra, Calif., assignor to Petrolite Corporation, Ltd., Wilmington, Del. Reducing or preventing foam. 2,408,527; Oct. 1.

Moorhead, John O., assignor to Metals and Controls Corporation, Attleboro, Mass. Gas burner system. 2,408,673; Oct. 1.

Morehouse, Eugene M., Tujunga, Calif., assignor to Adel Precision Products Corp. Wire or conduit clip. 2,408,572; Oct. 1.

Morehouse, Eugene M., Tujunga, Calif., assignor to Adel Precision Products Corp. Sheet metal nut. 2,408,573; Oct. 1.

Morey Machinery Co., Inc., assignee: *See*—
Kurzwell, Robert.

Morgan, Jack F.: *See*—
Guenther, Alfred, and Morgan.

Morris, Thomas L., Van Nuys, assignor of one-half to F. M. Boes, North Hollywood, Calif. Hydraulic transmission. 2,408,574; Oct. 1.

Mountain City Foundry and Machine Co., assignee: *See*—
Hunt, John O.

Moynihan, John J., Boston, Mass, assignor of one-half to J. B. Brennan, Cleveland, Ohio. Electrical system for the control of mechanical devices. 2,408,472; Oct. 1.

Muehlhofer, Richard, Mountainside, N. J. Apparatus for carbonating liquids. 2,408,439; Oct. 1.

Muntz, Alan, & Company Limited, assignee: *See*—
Beale, Evelyn S. L.

Nassour, Edward, Los Angeles, Calif. Race recording system. 2,408,528; Oct. 1.

National Tube Company, assignee: *See*—
Bednar, Joseph J., and Peck.

Nelson, Clarence P., Chicago, Ill. Dust seal for adjoining railroad cars. 2,408,473; Oct. 1.

Newman, Edwin B., and J. Miller, Cambridge, Mass. Noise shield for transmitter mouth-pieces. 2,408,474; Oct. 1.

Nickle, Clifford A., Schenectady, N. Y., assignor to General Electric Company. Fluorescent zinc oxide. 2,408,475; Oct. 1.

Noel, Edward B., Cleveland Heights, and A. W. Seitz, Euclid, Ohio, assignors to General Electric Company. Multiflash lamp device. 2,408,470; Oct. 1.

Noguera, Joseph, Prestwich, Manchester, assignor to Casablancas High Draft Company Limited, Manchester, England. Bobbin holder. 2,408,674; Oct. 1.

Norman, Charles R., Jr.: *See*—
Huntzicker, Harry N., and Norman.

Norman, George, assignor to Spalding Knitting Mills, Griffin, Ga. Seamless stocking. 2,408,440; Oct. 1.

North American Aviation, Inc., assignee: *See*—
Day, Luther F.
Gillum, Donald E., and Gallant.

Norton, Orlo C., Erie, Pa. Blower for handling desiccated material. 2,408,675; Oct. 1.

Norvig, Axel, Brooklyn, Conn. Garment for animals. 2,408,575; Oct. 1.

Novick, William, Brooklyn, N. Y. Soap holding brush. 2,408,676; Oct. 1.

NuTone, Incorporated, assignee: *See*—
Waltman, Chauncey E.

Nutt, Harold, assignor to Borg-Warner Corporation, Chicago, Ill. Clutch plate. 2,408,441; Oct. 1.

O. & F. Company Proprietary Limited, assignee: *See*—
Friedlander, Erwin F.

O'Brien, Joseph F., Jersey City, N. J., assignor to John B. Pierce Foundation, New York, N. Y. Electricity conductor unit. 2,408,442; Oct. 1.

O'Brien, Joseph F., Jersey City, N. J., assignor to John B. Pierce Foundation, New York, N. Y. Adapter unit for electric wiring systems. 2,408,443; Oct. 1.

Oil Well Supply Company, assignee: *See*—
Bennett, Daniel A., and Maier.

Osgood, Charles F., Claremont, N. H., assignor to Joy Manufacturing Company. Cutter chain. 2,408,476; Oct. 1.

Ost, Clarence S., Atlantic City, N. J. Apparatus for integrating radiant energy. 2,408,576; Oct. 1.

Osterberg, Harold, G. E. Pride, and P. C. Heijn, Buffalo, N. Y., assignors, by mesne assignments, to American Optical Company, Southbridge, Mass. Apparatus for treating articles. 2,408,529; Oct. 1.

Outboard Marine & Manufacturing Company, assignee: *See*—
Furry, John F.

Owen, William, Pittsburgh, and I. G. Peck, Ford City, Pa., assignors to Pittsburgh Plate Glass Company. Apparatus for cutting prisms. 2,408,530; Oct. 1.

Owens-Illinois Glass Company, assignee: *See*—
Bennett, Edward H.

Owner, Frank M., Bristol, assignor, by mesne assignments, to Rotol Limited, Gloucester, England. Propeller spinner. 2,408,677; Oct. 1.

Pacific Can Company, assignee: *See*—
Russell, George M.

Packard Motor Car Company, assignee: *See*—
Beltz, Lester L.

Paley, Harry, New York, N. Y. Toy holster for guns. 2,408,678; Oct. 1.

Palmer, Austin R., assignor to Baker Perkins Limited, Peterborough, England. Dough dividing machine. 2,408,679; Oct. 1.

Parke, Davis & Company, assignee: *See*—
Smith, Harry P.

Patterson, Alonzo C., assignee: *See*—
Levey, Harold A.

Pava, Jack R., assignor of one-half to D. F. Pincock, Santa Barbara, Calif. Plaster bandage machine. 2,408,577; Oct. 1.

Payne, Frank U., Farner, Tenn. Bottle dispensing refrigerator. 2,408,444; Oct. 1.

Payne, Robert T., Upland, Calif. Poultry feeder. 2,408,477; Oct. 1.

Pearson, Swan A., Chicago, Ill. Combustion control apparatus. 2,408,445; Oct. 1.

Peck, Ivan G.: *See*—
Owen, William, and Peck.

Peck, Steven P.: *See*—
Bednar, Joseph J., and Peck.

Penton, Joseph T., Pasadena, Calif. Stencilling. 2,408,578; Oct. 1.

Petrolite Corporation, Ltd., assignee: *See*—
Monson, Louis T.

Petty, Oliver S., San Antonio, Tex. Seismic apparatus and method. 2,408,478; Oct. 1.

Philco Corporation, assignee: *See*—
van Doren, Harold.

Phillips, John G., executor, et al.: *See*—
Fuller, Frederick L.

Pierce, John B., Foundation, assignee: *See*—
O'Brien, Joseph F.

Pincock, Douglas F., assignee: *See*—
Pava, Jack R.

Pittsburgh Plate Glass Company, assignee: *See*—
Haux, Elmer H.
Miller, Robert A., and Howard.
Minton, Gerald Z.
Owen, William, and Peck.

Placette, Theodore, assignee: *See*—
Tweedle, Charles E.

Pontius, George W., III, South Bend, Ind. Charger valve. 2,408,680; Oct. 1.

Pontius, George W., III. A. P. Wilson, and F. V. Kuzmitz, South Bend, Ind. Gun turret sighting compensation system. 2,408,681; Oct. 1.

Pooler, George H., Marietta, Ohio. Roundabout. 2,408,479; Oct. 1.

Portable Elevator Mfg. Co.: *See*—
Dennis, Luther D.

Porter, Charles A., Nutley, assignor to Resistoflex Corporation, Belleville, N. J. Adhering of polyvinyl alcohol compositions to other materials. 2,408,682; Oct. 1.

Powell, Herschel F.: *See*—
Rosebrook, Homer E., and Powell.

Price, Peter R., Bristol, assignor, by mesne assignments, to Rotol Limited, Gloucester, England. Speed-control and synchronizing device. 2,408,683; Oct. 1.

Pride, Gilbert E.: *See*—
Osterberg, Harold, Pride, and Heijn.

Quaker Oats Company, The, assignee, et al.: *See*—
Graham, William R., Kohler, and Hoover.

Quinn, Leonard J.: *See*—
Davenport, James E., and Quinn.

Radio Corporation of America, assignee: *See*—
Burrill, Charles M.
Dimmick, Glenn L.
Evans, John.
Roberts, Walter van B.
Shore, Henry.
Sinnett, Chester M., and Belar.
Smith, Perry C.
Sziklai, George C.

Radio Electronics Limited, assignee: *See*—
Van den Bosch, Francois J. G.

Ralston, James V., assignor to Bendix-Westinghouse Automotive Air Brake Company, Elyria, Ohio. Control mechanism. 2,408,446; Oct. 1.

Randrup, Benjamin F., Brisbane, Calif. Foldable boat. 2,408,579; Oct. 1.

Rau, Harry A., assignor to Crown Cork & Seal Company, Inc., Baltimore, Md. Apparatus for sealing containers. 2,408,447; Oct. 1.

Read, Davis, Jr., Riverside, assignor to Universal Oil Products Company, Chicago, Ill. Hydrocarbon conversion process. 2,408,580; Oct. 1.

Reconstruction Finance Corporation, assignee: *See*—
Lyons, Ellis C.

Reid, John G., Jr., Evansville, Ind., assignor to Servel, Inc., New York, N. Y. Evaporator for low-pressure refrigerants. 2,408,480; Oct. 1.

Reid, Willard, New York, N. Y. Cigarette conditioner. 2,408,481; Oct. 1.

Republic Flow Meters Company, assignee: *See*—
Rosenberger, Albert J.

Resistoflex Corporation, assignee: *See*—
Dangelmajer, Charles.
Porter, Charles A.

Riddle, Harvey W., Branford, Conn., assignor to The American Steel and Wire Company of New Jersey. Torpedo net. 2,408,482; Oct. 1.

Riemann, Howard C., West Milwaukee, and J. R. Thorp, assignors to The Fulton Company, West Allis, Wis. Trailer hitch. 2,408,531; Oct. 1.

Rifkin, Milton, Denver, Colo. Self-serve automatic registering device. 2,408,581; Oct. 1.

Rival Manufacturing Company, assignee: *See*—
Talge, Henry J., and Landry.

Roach, Earl M., assignor to Arvey Corporation, Chicago, Ill. Collapsible framed display. 2,408,532; Oct. 1.

Roberts, Walter V., Princeton, N. J., assignor to Radio Corporation of America. Frequency-variable oscillator circuit. 2,408,684; Oct. 1.

Robertson, P. L., Mfg. Co., Limited, assignee: *See*—
Rush, John A.

Roche Products Limited, assignee: *See*—
Avison, Anthony W. D., Bergel, and Haworth.

Rodman, Frank A., assignor to Libbey-Owens-Ford Glass Company, Toledo, Ohio. Laminated glass structure. 2,408,483; Oct. 1.

Rolls-Royce Limited, assignee: *See*—
Griffith, Alan A.

Rosebrook, Homer E., and H. F. Powell, assignors, by mesne assignments, to Gibson Refrigerator Company, Greenville, Mich. Refrigerator. 2,408,582; Oct. 1.

Rosenberger, Albert J., assignor to Republic Flow Meters Company, Chicago, Ill. Pressure responsive measuring instrument. 2,408,685; Oct. 1.

Rossman, Allen M., Wilmette, Ill. Two-cycle engine. 2,408,448; Oct. 1.

Roth, Eugene, assignee, et al.: *See*—
Schonthal, Leopold.

Rotol Limited, assignee: *See*—
Owner, Frank M.
Price, Peter R.

Rush, John A., assignor to P. L. Robertson Mfg. Co. Limited, Milton, Ontario, Canada. Machine for slotting screws. 2,408,686; Oct. 1.

Russell, Anne, administratrix: *See*—
Russell, George M.

Russell, George F.: *See*—
Mann, Julius W., and Russell.

Russell, George M., deceased, Millbrae; A. Russell, administratrix, assignor to Pacific Can Company, San Francisco, Calif. Fluid fountain for printing presses. 2,408,449; Oct. 1.

Russell, Harlow M., assignee: *See*—
Sidebotham, Melvin H.

Russell, Louis C., McGraw, N. Y. Cattle stall partition appliance. 2,408,533; Oct. 1.

Ryan, John D.: *See*—
Erickson, Arvid M., and Ryan.

Sanchez, Emilio B., Miami, Fla. Game apparatus. 2,408,687; Oct. 1.

Schafer, Conrad B.: *See*—
Watkins, George B., and Schafer.

Schellschmidt, Alvin E.: *See*—
Briskin, Theodore S., Zivny, Schellschmidt, and Golick.

Schonthal, Leopold, New York, assignor of one-third to E. Roth, Elmsford, and one-third to N. Jarvis, New York, N. Y. Safety pocket lock. 2,408,688; Oct. 1.

Schorer, Otto J., Holyoke, Mass., assignor to Worthington Pump and Machinery Corporation, Harrison, N. J. Lubricating system for rock drills. 2,408,534; Oct. 1.

Schrader, Raymond C., Peoria, assignor to V. Ray Van Wey, Pekin, Ill. Broken stud remover. 2,408,450; Oct. 1.

Schwarzkopf, Arthur R., assignor to Wodack Electric Tool Corporation, Chicago, Ill. Percussive tool. 2,408,484; Oct. 1.

Scientific Research and Development, United States of America, as represented by the Executive Secretary of the Office of, assignee: *See*—
Stevens, Stanley S.
Veneklasen, Paul S.

Seiden Pneumatic Tool Company, assignee: *See*—
Lutes, Oakley D.

Seitz, August W.: *See*—
Noel, Edward B., and Seitz.

Seme, John J., Maple Heights, assignor, by mesne assignments, to Jack & Heintz Precision Industries, Inc., Cleveland, Ohio. Concentricity gauge specimen holder. 2,408,689; Oct. 1.

Servel, Inc., assignee: *See*—
Reid, John G., Jr.

Seymour, Raymond B., Dayton, Ohio, assignor to Monsanto Chemical Company. Polymerization of vinyl aromatic compounds. 2,408,690; Oct. 1.

Shaw, Walter M., Arkansas City, Kans. Forced draft floor heater. 2,408,691; Oct. 1.

Shepherd, Judson O., Atlanta, Ga. Position control system. 2,408,485; Oct. 1.

Shinkle, Edward M., Burlington, Iowa. Hand grenade and fuse therefor. 2,408,486; Oct. 1.

Shore, Henry, Jackson Heights, N. Y., assignor to Radio Corporation of America. Signaling system. 2,408,692; Oct. 1.

Sidebotham, Melvin H., Newton, assignor of one-half to Harlow M. Russell, Chelsea, Mass. Nipple applying implement. 2,408,693; Oct. 1.

Siegel, A. L., Co. Inc., assignee: *See*—
Levitt, Benjamin A.

Simons, John K., Toledo, Ohio, and W. I. Weaver, Pittsburgh, Pa., assignors, by mesne assignments, to Libbey-Owens-Ford Glass Company. Preparing acyl guanidines. 2,408,694; Oct. 1.

Sinnett, Chester M., Westmont, and H. Belar, Palmyra, N. J., assignors to Radio Corporation of America. Record reproducing system. 2,408,695; Oct. 1.

Sions, John M., Middle River, Md. Card terminal plug. 2,408,583; Oct. 1.

Smallwood, Hugh M., Nutley, N. J., assignor to United States Rubber Company, New York, N. Y. Treatment of carbon black. 2,408,696; Oct. 1.

Smith, A. O., Corporation, assignee: *See*—
Hart, Edward.

Smith, Arthur D., Park Ridge, assignor to Jenkins Petroleum Process Company, Chicago, Ill. Hydrocarbon cracking process with successive additions of adsorbent. 2,408,584; Oct. 1.

Smith, Harry P., Iowa City, Iowa, assignor to Parke, Davis & Company, Detroit, Mich. Thromboplastin product and preparation of same. 2,408,535; Oct. 1.

Smith, Harry P., Iowa City, Iowa, assignor to Parke, Davis & Company, Detroit, Mich. Prothrombin product and preparation of same. 2,408,536; Oct. 1.

Smith, Jesse W., Cobleskill, N. Y. Laying, forming and interconnecting concrete blocks. 2,408,585; Oct. 1.

Smith, Michael F., Los Angeles, Calif. Garment hanger attachment. 2,408,697; Oct. 1.

Smith, Norman H., Pawtucket, assignor to Hemphill Company, Central Falls, R. I. Knitting machine and knitting. 2,408,698; Oct. 1.

Smith, Perry C., Moorestown, N. J., assignor to Radio Corporation of America. Art of ascertaining the atomic structure of materials. 2,408,487; Oct. 1.

Smithells, Colin J.: *See*—
Hopps, Bernard, and Smithells.

Societe Anonyme Pour La Construction de Materiel Automobile (S. A. C. M. A.), assignee: *See*—
Mennesson, Marcel.

Sommer, Eric E.: *See*—
Clapsadle, Leo J., Kratzer, and Sommer.

Sorensen, Edward M., Dayton, Ohio. Speed control system. 2,408,451; Oct. 1.

Sorensen, Louis N., Port Clinton, Ohio, assignor to The Celotex Corporation, Chicago, Ill. Perforating gypsum lath. 2,408,488; Oct. 1.

Spalding Knitting Mills, assignee: *See*—
Norman, George.

Sparrow, Hubert T., assignor to Minneapolis-Honeywell Regulator Company, Minneapolis, Minn. Aircraft temperature control. 2,408,699; Oct. 1.

Sperry Gyroscope Company, Inc., assignee: *See*—
Curry, Robert S., Jr.
Ginzton, Edward L.
Jenks, Frederic A., Folland, Maeder, and Cooke.

Spievak, Louis A., West Los Angeles, Calif. Adjustable hold-down device. 2,408,586; Oct. 1.

Sprung, Murray M., Scotia, N. Y., assignor to General Electric Company. Synthetic wax composition. 2,408,700; Oct. 1.

Stalker, Edward A., Ann Arbor, Mich. Rotary wing aircraft. 2,408,439; Oct. 1.

Standard Cabinet Works, Inc., assignee: *See*—
Bertschinger, Frederick E.

Standard Stoker Company, Incorporated, assignee: *See*—
Surdy, Charles J.

Stevens, Stanley S., Cambridge, Mass., assignor to the United States of America, represented by the Executive Secretary of the Office of Scientific Research and Development. Earphone socket. 2,408,490; Oct. 1.

Stewart, Willis G.: *See*—
Tucker, Preston T., Stewart, and Tanner.

Stixrud, John L., Los Angeles, Calif. Shorthand typewriting machine. 2,408,452; Oct. 1.

Stixrud, John L., Los Angeles, Calif. Shorthand typewriting machine. 2,408,453; Oct. 1.

Strickland, Elwin M., Detroit, assignor of one-half to A. F. Wall, Grosse Pointe, Mich. Work holding fixture. 2,408,491; Oct. 1.

Submarine Signal Company, assignee: *See*—
Batcheider, Lawrence.
Benioff, Hugo.
Turner, Edwin E., Jr.

Sullivan, David J.: *See*—
Edgar, Donald E., and Sullivan.

Sullivan, Francis M., North Bergen, N. J. Decolorizing oils and agents therefor. 2,408,454; Oct. 1.

Surdy, Charles J., Erie, Pa., assignor to The Standard Stoker Company, Incorporated. Steam motive power. 2,408,701; Oct. 1.

Swift, George W., Jr. Inc., assignee: *See*—
Bruker, Hobart W.

Szikiai, George C., Princeton, N. J., assignor to Radio Corporation of America. Angle modulated wave detector. 2,408,702; Oct. 1.

Taborski, Alfred F., Buffalo, and J. W. Terry, Niagara Falls, N. Y. Necktie. 2,408,455; Oct. 1.

Talge, Foster L., assignee, et al.: *See*—
Talge, Henry J., and Landry.

Talge, Henry J., and W. J. Landry, assignors to J. C. Hockery, and F. L. and H. J. Talge, doing business as Rival Manufacturing Company, Kansas City, Mo. Wall bracket for kitchen utensils. 2,408,703; Oct. 1.

Tanner, James H.: *See*—
Tucker, Preston T., Stewart, and Tanner.

Tauch, Ernest J., Cleveland Heights, Ohio, assignor to E. I. du Pont de Nemours & Company, Wilmington, Del. Manufacture of sulphamic acid. 2,408,492; Oct. 1.

Taylor, George R., Kenosha, Wis. Liquid cooler for refrigerators. 2,408,704; Oct. 1.

Taylor, Maurice H.: *See*—
Healy, John J., Jr., Taylor, and Abbiati.

Terry, Joseph W.: *See*—
Taborski, Alfred F., and Terry.

Thomas, Chester A.: *See*—
Babson, Henry B., and Thomas.

Thomason, William H., Margret, Ga. Drive mechanism. 2,408,456; Oct. 1.

Thompson, Edward O.: *See*—
Biehl, Fred, and Thompson.

Thorp, Joel R.: *See*—
Riemann, Howard C., and Thorp.

Todd, Keith W., Warrington, assignor to Metropolitan-Vickers Electrical Company Limited, London, England. Mechanical relay of the fluid jet type. 2,408,705; Oct. 1.

Toledo Scale Company, assignee: *See*—
Wood, George R.

Tower, Charles H.: *See*—
Lowey, Francis J., and Tower.

Townsend, Mark A., Cleveland Heights, Ohio, assignor to General Electric Company. Starting control for electric discharge devices. 2,408,493; Oct. 1.

Travis, Henry, Ocean Beach, Calif. Rotating airplane landing wheels. 2,408,706; Oct. 1.

Trico Products Corporation, assignee: *See*—
Horton, Erwin C.

Triple Insulaire Company, The, assignee: *See*—
Aschenbrener, Rudolph A.

Tripp, Chester D., Chicago, Ill. Lock nut making machine. 2,408,457; Oct. 1.

Tropical Plantations Limited, assignee: *See*—
Hitchcock, Stanley I.

Tucker Aircraft Corporation, assignee: *See*—
Tucker, Preston T., Stewart, and Tanner.

Tucker, John W., Manchester, Ga. Textile machinery. 2,408,587; Oct. 1.

Tucker, Preston T., Detroit, Mich., W. G. Stewart, and J. H. Tanner, New York, N. Y., assignors to Tucker Aircraft Corporation, Detroit, Mich. Gun mounting and control mechanism. 2,408,707; Oct. 1.

Turner, Edwin E., Jr., West Roxbury, assignors, by mesne assignments, to Submarine Signal Company, Boston, Mass. Apparatus for echo distance measurement. 2,408,458; Oct. 1.

Tuttle, Alfred C., Montreal, Quebec, Canada. Portable power driven conveyer. 2,408,459; Oct. 1.

Tweedie, Charles E., Great Lakes, Ill., assignor, by mesne assignments, to T. Placette, Hays County, Tex. Hydraulic relief valve. 2,408,708; Oct. 1.

Union Oil Company of California, assignee: *See*—
Berg, Clyde H. O.

Union Switch & Signal Company, The, assignee: *See*—
Volz, Carl.

United Aircraft Corporation, assignee: *See*—
Kalitinsky, Andrew.

United Shoe Machinery Corporation, assignee: *See*—
Leveque, Bernard T.

United States Gypsum Company, assignee: *See*—
Huntsicker, Harry N., and Norman.

United States Rubber Company, assignee: *See*—
Smallwood, Hugh M.

Universal Oil Products Company, assignee: *See*—
Bloch, Herman S.
Read, Davis, Jr.

Van den Bosch, Francois J. G., Surrey, England, assignor to Radio Electronics Limited. Electron multiplier. 2,408,709; Oct. 1.

Van Doren, Harold, Bryn Mawr, assignor, by mesne assignments, to Philco Corporation, Philadelphia, Pa. Refrigerator. 2,408,460; Oct. 1.

Van Nuys, Claude C., Greenwich, Conn., assignor to Air Reduction Company, Incorporated, New York, N. Y. Separating the constituents of air. 2,408,710; Oct. 1.

Van Wey, V. Ray, assignee: *See*—
Schrader, Raymond D.

Veneklasen, Paul S., Saugus, Mass., assignor to the United States of America, as represented by the Executive Secretary of the Office of Scientific Research and Development. Earphone socket. 2,408,494; Oct. 1.

Volz, Carl, Pittsburgh, assignor to The Union Switch & Signal Company, Swissvale, Pa. Apparatus to detect change of voltage. 2,408,711; Oct. 1.

Wager, Robert H., Maplewood, N. J. Smoke inspection device. 2,408,495; Oct. 1.

Wall, Albert F., assignee: *See*—
Strickland, Elwin M.

Waltman, Chauncey E., Chicago, Ill., assignor to NuTone, Incorporated, New York, N. Y. Power unit for electric chimes. 2,408,712; Oct. 1.

Wanasek, Anthony R., assignee: *See*—
Bagan, John P.

War, United States of America, as represented by the Secretary of, assignee: *See*—
Chu, Lan J.

Watkins, George B., Toledo, Ohio, and C. B. Schafer, Charleston, W. Va., assignors to Libbey-Owens-Ford Glass Company, Toledo, Ohio. Glass surfacing method and apparatus. 2,408,496; Oct. 1.

Watts, Sidney S., Southgate, London, N. 14, assignor to The British Oxygen Company Limited, London, England. Apparatus for dividing or desurfacing metal by use of oxidising sets. 2,408,588; Oct. 1.

Weaner, Walter C., Muncie, Ind. Power coupling means. 2,408,497; Oct. 1.

Weaver, Welcome I.: *See*—
Simons, John K., and Weaver.

Webb, Wesley L., Glen Moore, Pa., assignor to American Viscose Corporation, Wilmington, Del. Extrusion device. 2,408,713; Oct. 1.

Weingarten, Joseph, Bronx, N. Y. One-piece garment. 2,408,537; Oct. 1.

Welk, Nelson S., assignor to The McBee Company, Athens, Ohio. Apparatus for cooling and hardening wax carboa coatings. 2,408,498; Oct. 1.

Wellman, S. K., Company, assignee: *See*—
Lowey, Francis J., and Tower.

Wells, Alvin W., Chicago, assignor of one-half to J. W. Wells, Decatur, Ill. Apparatus for producing electrical oscillations. 2,408,589; Oct. 1.

Wells, Frank E., Alliance, Ohio. Piston expander. 2,408,499; Oct. 1.

Wells, Jewel W., assignee: *See*—
Wells, Alvin W.

West, Maxwell A., Portland, Oreg. Automatic counterbalance for boom derricks. 2,408,500; Oct. 1.

Western Electric Company, Incorporated, assignee: *See*—
Hays, James B., Jr.

Westinghouse Electric Corporation, assignee: *See*—
Bock, Ashley P.
Wickerham, William R.

Whalen, John, Brooklyn, N. Y. Safe screen support. 2,408,714; Oct. 1.

Wickerham, William R., Swissvale, assignor to Westinghouse Electric Corporation, East Pittsburgh, Pa. Control system. 2,408,461; Oct. 1.

Wiggins, John H., Chicago, Ill. Liquid storage apparatus. 2,408,538; Oct. 1.

Wiggins, John H., Chicago, Ill. Fluid storage apparatus. 2,408,539; Oct. 1.

Wilcox, Kenneth: *See*—
Braithwaite, Robert C., and Wilcox.

Wilkerson, Victor O., Vestal, assignor to International Business Machines Corporation, New York, N. Y. Record controlled machine. 2,408,715; Oct. 1.

Williams, Ervin L., Los Angeles, Calif. Motor driven signal. 2,408,590; Oct. 1.

Williams, William E., New York, N. Y. Forming scratch-resistant articles. 2,408,540; Oct. 1.

Wilson, Arthur P.: *See*—
Pontius, George W., III, Wilson, and Kuzmits.

Wilson, Ronald M., Devon, assignor, by mesne assignments, to William M. Wilson's Sons Inc., Lansdale, Pa. Faucet. 2,408,541; Oct. 1.

Wilson's, William M., Sons, Inc., assignee: *See*—
Wilson, Ronald M.

Wine, William E., Toledo, Ohio. Demountable traction unit for tractor wheels. 2,408,591; Oct. 1.

Wise, Raymond O., Short Hills, N. J., assignor to Bell Telephone Laboratories, Incorporated, New York, N. Y. Telephone system. 2,408,462; Oct. 1.

Witchger, Eugene S., Grosse Pointe, Mich., assignor to Eaton Manufacturing Company, Cleveland, Ohio. Pump construction. 2,408,716; Oct. 1.

Wodack Electric Tool Corporation, assignee: *See*—
Schwarzkopf, Arthur R.

Wood, George R., Montreal, Quebec, Canada, assignor to Toledo Scale Company, Toledo, Ohio. Slicing machine. 2,408,717; Oct. 1.

Worthington Pump and Machinery Corporation, assignee: *See*—
Schorer, Otto J.

Wright, Fred J., Upper Arlington, Ohio, assignor, by mesne assignments, to The Jeffrey Manufacturing Company. Overload release. 2,408,501; Oct. 1.

Wright, Hubert B., Nashville, Tenn. Bottle stopper and pouring spout. 2,408,463; Oct. 1.

Writzmann, Alex A., Wauwatosa, assignor to Cutler-Hammer, Inc., Milwaukee, Wis. Waterproof combined electric switch and pistol grip. 2,408,502; Oct. 1.

Wyman, Floyd H., and J. M. Malik, Toccoa, Ga., assignors to R. G. Le Tourneau, Inc., Stockton, Calif. Forging die and mount assembly. 2,408,542; Oct. 1.

Young, Ray A., Willoughby, Ohio. Pin clutch arbor. 2,408,503; Oct. 1.

Zivny, Joseph C.: *See*—
Briskin, Theodore S., Zivny, Sheelischmidt, and Golick.

LIST OF REISSUE INVENTIONS

FOR WHICH

PATENTS WERE ISSUED ON THE 1ST DAY OF OCTOBER, 1946

NOTE.—Arranged in accordance with the first significant character or word of the name (in accordance with city and telephone directory practice).

Control system for automatic telephone systems, Electrical. G. Deakin. Re. 22,794; Oct. 1.
Fan and eyeshield, Combination. H. A. Husted. Re. 22,796; Oct. 1.
Nut cracking machine. L. K. Maulsby and J. A. McGrann. Re. 22,797; Oct. 1.
Toggle fastening means for, floating closures. H. Wolcott. Re. 22,798; Oct. 1.
Tube structure, High frequency. W. Hansen and R. H. and S. F. Varian. Re. 22,795; Oct. 1.

LIST OF PLANT INVENTIONS

Chrysanthemum plant. E. Prushek. 711; Oct. 1.

LIST OF DESIGN INVENTIONS

Airplane. R. C. Sebold. 145,680; Oct. 1.
Brooch or similar article. A. Katz. 145,665–7; Oct. 1.
Brooch or similar article. A. Philippe. 145,676; Oct. 1.
Button, Rim. C. H. Frank. 145,663; Oct. 1.
Cap, Container. P. A. Derham. 145,661; Oct. 1.
Cart, Chair. L. P. Brantz. 145,655; Oct. 1.
Chair. A. Roth. 145,678; Oct. 1.
Cleaner attachment, Vacuum. C. B. Stevens. 145,681; Oct. 1.
Clothespin. C. E. Seale and L. W. Stinne. 145,679; Oct. 1.
Clock, Alarm. F. Lux. 145,672; Oct. 1.
Coaster and ash tray holder, Combined. L. J. Binder. 145,653; Oct. 1.
Container, Cigarette. G. L. Kearney. 145,668; Oct. 1.
Desk and seat, Combination. J. D. Covington. 145,659; Oct. 1.
Fabric. L. Langer. 145,671; Oct. 1.
Fabric, Embroidered. A. Walter. 145,682; Oct. 1.
Frame or similar article, Folding picture. R. Kraus. 145,669; Oct. 1.
Frame, Handbag. C. W. Hardy. 145,664; Oct. 1.
Frame or the like, Mirror. F. Diamond. 145,662; Oct. 1.
Opener, Letter. J. J. Calichio. 145,656; Oct. 1.
Piano. A. Bach. 145,648–9; Oct. 1.
Razor, Safety. L. M. Baer. 145,650; Oct. 1.
Settee and telephone cabinet, Combined. F. B. Case. 145,657; Oct. 1.
Shoe or similar article. H. J. Kroto. 145,670; Oct. 1.
Shoe or similar article. E. Ziniti. 145,684; Oct. 1.
Table base, Drafting. R. M. Bennet. 145,651; Oct. 1.
Tablecloth or similar article. L. G. Rohner. 145,677; Oct. 1.
Toy gun. S. I. Berger. 145,652; Oct. 1.
Train, Overhead monorail. C. B. Clark. 145,658; Oct. 1.
Tricycle. W. H. Culler. 145,660; Oct. 1.
Watchcase. M. Ostier. 145,673–5; Oct. 1.
Workbench, Laboratory. J. Bjorksten. 145,654; Oct. 1.
Wrench, Jar top. G. Yates. 145,683; Oct. 1.

LIST OF INVENTIONS

FOR WHICH

PATENTS WERE ISSUED ON THE 1ST DAY OF OCTOBER, 1946

NOTE.—Arranged in accordance with the first significant character or word of the name (in accordance with city and telephone directory practice).

Acid compositions, Silicic. R. K. Iler and J. S. Kirk. 2,408,655; Oct. 1.
Acid sols, Producing silicic. J. S. Kirk. 2,408,656; Oct. 1.
Acid sols, Silicic. J. S. Kirk. 2,408,654; Oct. 1.
Acyl guanidines, Preparing. J. K. Simons and W. I. Weaver. 2,408,694; Oct. 1.
Adapter unit for electric wiring systems. J. F. O'Brien. 2,408,443; Oct. 1.
Adjusting device, Escapement. E. A. Derungs and O. Chatelain. 2,408,612; Oct. 1.
Air conditioning system, Ice. J. M. Hall. 2,408,635; Oct. 1.
Aircraft having moving airfoil or wing. A. R. Jackson. 2,408,649; Oct. 1.
Aircraft, Rotary wing. E. A. Stalker. 2,408,489; Oct. 1.
Air filter. C. G. Lamb. 2,408,659; Oct. 1.
Air-speed indicator. A. R. Lee. 2,408,661; Oct. 1.
Alloy: *See*—
Flint alloy.
Altimeter, Absolute. C. A. Donaldson. 2,408,414; Oct. 1.
Amplifying apparatus, High frequency. R. V. L. Hartley. 2,408,423; Oct. 1.
Amplitude-modulation and frequency-modulation receiver stage, Combined. J. W. Hull. 2,408,644; Oct. 1.
Animal trap. P. M. Barber. 2,408,593; Oct. 1.
Antenna. L. J. Chu. 2,408,373; Oct. 1.
Antenna and prism, Pipe. W. P. Mason. 2,408,435; Oct. 1.
Apparatus for carbonating liquids. R. Muehlhofer. 2,408,439; Oct. 1.
Apparatus for cleaning eggs and the like. C. H. Inman. 2,408,648; Oct. 1.
Apparatus for controlling power transmission systems. S. Hedgecock. 2,408,638; Oct. 1.
Apparatus for cooling and hardening wax carbon coatings. N. S. Welk. 2,408,498; Oct. 1.
Apparatus for cutting prisms. W. Owen and I. G. Peck. 2,408,530; Oct. 1.
Apparatus for dividing or desurfacing metal by use of oxidizing sets. S. S. Watts. 2,408,588; Oct. 1.
Apparatus for echo distance measurement. E. E. Turner, Jr. 2,408,458; Oct. 1.
Apparatus for extruding. L. B. Green. 2,408,627; Oct. 1.
Apparatus for integrating radiant energy. C. S. Ost. 2,408,576; Oct. 1.
Apparatus for measuring or checking transverse dimensions. M. Mennesson. 2,408,672; Oct. 1.
Apparatus for molding plastic material. L. B. Green. 2,408,630; Oct. 1.
Apparatus for producing electrical oscillations. A. W. Wells. 2,408,589; Oct. 1.
Apparatus for sealing containers. H. A. Rau. 2,408,447; Oct. 1.
Apparatus for treating articles. H. Osterberg, G. E. Pride, and P. C. Heijn. 2,408,529; Oct. 1.
Apparatus to detect change of voltage. C. Volz. 2,408,711; Oct. 1.
Appliance, Foot. B. Ferrar. 2,408,617; Oct. 1.
Article transfer mechanism. E. H. Bennett. 2,408,599; Oct. 1.
Atomic structure of materials, Ascertaining the. P. C. Smith. 2,408,487; Oct. 1.
Attachment for cranes, Stabilizer. J. E. Davenport and L. J. Quinn. 2,408,378; Oct. 1.
Automatic registering device, Self-serve. M. Rifkin. 2,408,581; Oct. 1.
Automobile jack. C. C. Craig. 2,408,376; Oct. 1.
Azo dyestuffs containing an N-morpholino-arylide group, Water insoluble. H. W. Grimmel and A. Guenther. 2,408,421; Oct. 1.
Ball-winding machine. J. R. Gammeter. 2,408,552; Oct. 1.
Bandage machine, Plaster. J. R. Pava. 2,408,577; Oct. 1.
Blind riveting apparatus. O. D. Lutes. 2,408,431; Oct. 1.
Blocks, Laying, forming and interconnecting concrete. J. W. Smith. 2,408,585; Oct. 1.
Blower for handling desiccated material. O. C. Norton, 2,408,675; Oct. 1.
Boat, Foldable. B. F. Randrup. 2,408,579; Oct. 1.
Bobbin holder. J. Noguera. 2,408,674; Oct. 1.
Bolt, Toggle. H. N. Boyer. 2,408,366; Oct. 1.
Bootjack and boot hook, Combined. C. G. Hilton, 2,408,640; Oct. 1.
Boots, Attachment for stadium. H. L. Lea. 2,408,564; Oct. 1.
Bottle dispensing apparatus. L. D. Dennis. 2,408,380; Oct. 1.
Bottle stopper and pouring spout. H. B. Wright. 2,408,463; Oct. 1.
Bow tie device. M. Greenfield. 2,408,631; Oct. 1.
Bowling pin setting indicator. R. A. Aschenbrener. 2,408,592; Oct. 1.
Bracket for kitchen utensils, Wall. H. J. Talge and W. J. Landry. 2,408,703; Oct. 1.
Bristle, High capillarity. E. H. Haux. 2,408,718; Oct. 1.
Broaching machine. F. J. Lapointe. 2,408,521; Oct. 1.
Brush, Greenhouse roof bar cleaning. R. C. Hart. 2,408,555; Oct. 1.
Brush, Soap holding. W. Novick. 2,408,676; Oct. 1.
Bucket assembly, Spinning. H. J. McDermott. 2,408,670; Oct. 1.
Camera, Photographic. G. A. Brueske. 2,408,549; Oct. 1.
Cap: *See*—
Container cap.
Carbon black, Treatment of. H. M. Smallwood. 2,408,696; Oct. 1.
Card terminal plug. J. M. Sions. 2,408,583; Oct. 1.
Catalysts, Activating. G. F. Horsley. 2,408,396; Oct. 1.
Chain: *See*—
Cutter chain.
Charger valve. G. W. Pontius, III. 2,508,680; Oct. 1.
Checking device, Railway wheel. M. W. and W. A. Gieskieng. 2,408,553; Oct. 1.
Chimney top. E. R. Lovely. 2,408,665; Oct. 1.
Chlorophyll from vitamins and other fat materials, Separating. W. R. Graham, Jr., G. O. Kohler, and R. D. Hoover. 2,408,625; Oct. 1.
Chuck, Center drill. B. F. King. 2,408,652; Oct. 1.
Cinder cutting, Retarding. W. B. Leaf. 2,408,428; Oct. 1.
Circuit: *See*—
Frequency-variable oscillator circuit.
Clamp: *See*—
Plate clamp.
Clip: *See*—
Wire or conduit clip.
Closure to render bottles nonrefillable, Bottle. H. W. Hagen. 2,408,634; Oct. 1.
Clutch: *See*—
Reversible clutch.
Clutch arbor, Pin. R. A. Young. 2,408,503; Oct. 1.
Collar, Turndown shirt. L. U. Michael. 2,408,570; Oct. 1.
Combustion control apparatus. S. A. Pearson. 2,408,445; Oct. 1.
Compressional wave system, Multiplex. W. P. Mason. 2,408,436; Oct. 1.
Computing instrument, Navigational. H. L. Mitchell. 2,408,571; Oct. 1.
Concentricity gauge specimen holder. J. J. Seme. 2,408,689; Oct. 1.
Conditioner, Cigarette. W. Reid. 2,408,481; Oct. 1.
Conductor unit, Electricity. J. F. O'Brien. 2,408,442; Oct. 1.
Connector: *See*—
Safety plug-in connector.
Constituents of air, Separating. C. C. Van Nuys. 2,408,710; Oct. 1.
Container cap. L. L. Lauve. 2,408,465; Oct. 1.
Control for electric discharge devices, Starting. M. A. Townsend. 2,408,493; Oct. 1.
Control mechanism. J. V. Ralston. 2,408,446; Oct. 1.
Control system. W. R. Wickerham. 2,408,461; Oct. 1.
Control system, Position. J. O. Shepherd. 2,408,485; Oct. 1.
Conveyer, Portable power driven. A. C. Tuttle. 2,408,459; Oct. 1.
Cooler for refrigerators, Liquid. G. R. Taylor. 2,408,704; Oct. 1.
Copper, Electrolysis of. W. C. Mason. 2,408,668; Oct. 1.
Counterbalance for boom derricks, Automatic. M. A. West. 2,408,500; Oct. 1.
Coupler. E. P. Kinne. 2,408,653; Oct. 1.
Coupling. F. E. Bertschinger. 2,408,547; Oct. 1.
Coupling and power steering unit, Draft. R. L. Akers. 2,408,360; Oct. 1.
Coupling and steering unit. R. L. Akers. 2,408,359; Oct. 1.
Coupling means, Power. W. C. Weaner. 2,408,497; Oct. 1.
Cowling for airplanes. D. M. Capanoli. 2,408,371; Oct. 1.
Cracking process. C. H. O. Berg. 2,408,600; Oct. 1.
Crutch. T. B. Brickson. 2,408,604; Oct. 1.
Cup for milking machines, Teat. F. A. Gessler. 2,408,390; Oct. 1.
Curler, Hair. R. Krasberg. 2,408,657; Oct. 1.
Cutter chain. C. F. Osgood. 2,408,476; Oct. 1.
Cylinder construction. A. Kalitinsky. 2,408,427; Oct. 1.
Cylinder ends, Forming. J. J. Bednar and S. P. Peck. 2,408,596; Oct. 1.

Decolorizing oils and agents therefor. F. M. Sullivan. 2,408,454; Oct. 1.
Detector, Angle modulated wave. G. C. Sziklai. 2,408,702; Oct. 1.
Device for automotive vehicles, Free-wheeling. M. Mallory. 2,408,566; Oct. 1.
Device for forming slits. A. A. Gradisar. 2,408,512; Oct. 1.
Die and mount assembly, Forging. F. H. Wyman and J. M. Malik. 2,408,542; Oct. 1.
Diesel engine and operating same. C. N. Guerasimoff. 2,408,394; Oct. 1.
Disk and tool shank, Detachable screw-cutting. C. Lieblein. 2,408,565; Oct. 1.
Distant-control device, Electrically operated. A. Arnot. 2,408,543; Oct. 1.
Dividing machine, Dough. H. W. Bowker. 2,408,602; Oct. 1.
Door: *See*—
Folding door.
Domestic appliance. K. Clark. 2,408,509; Oct. 1.
Double-casing high-pressure pump. E. Hart. 2,408,637; Oct. 1.
Dough dividing machine. A. R. Palmer. 2,408,679; Oct. 1.
Drilling unit, Rotary. D. A. Bennett and A. R. Maier. 2,408,364; Oct. 1.
Drive mechanism. W. H. Thomason. 2,408,454; Oct. 1.
Drive mechanism for driven wheels, Steering. C. C. Brown. 2,408,507; Oct. 1.
Drying materials uniformly throughout their mass, Method and apparatus for. J. W. Mann and G. F. Russell. 2,408,434; Oct. 1.
Dynamoelectric machine. S. I. Hitchcock. 2,408,641; Oct. 1.
Earth moving machine. A. B. McFarlane. 2,408,671; Oct. 1.
Electric discharge device. J. Evans. 2,408,383; Oct. 1.
Electric gauge. R. Mestas. 2,408,524; Oct. 1.
Electrical apparatus. H. Benioff. 2,408,405–6; Oct. 1.
Electrical system. A. H. Dickinson. 2,408,613; Oct. 1.
Electrical system for the control of mechanical devices. J. J. Moynihan. 2,408,472; Oct. 1.
Electrodes, Arc welding. E. F. Friedlander. 2,408,619–20; Oct. 1.
Electronic device, Ultra high frequency. A. E. Bowen. 2,408,409; Oct. 1.
Engine: *See*—
Internal-combustion engine.
Two-cycle engine.
Engine and engine cooling method. J. F. Furry. 2,408,386; Oct. 1.
Erecting gyro vertical instruments. R. S. Curry, Jr. 2,408,411; Oct. 1.
Evaporator for low-pressure refrigerants. J. G. Reid, Jr. 2,408,430; Oct. 1.
Exercising device. T. H. Belling. 2,408,597; Oct. 1.
Expander, Piston. F. E. Wells. 2,408,499; Oct. 1.
Extension, Ladder. J. D. Chase. 2,408,372; Oct. 1.
Extension, Multiple. T. L. Johnson. 2,408,398; Oct. 1.
Extrusion device. W. L. Webb. 2,408,713; Oct. 1.
Fabric: *See*—
Wire reinforced fabric.
Faucet. R. M. Wilson. 2,408,541; Oct. 1.
Faucet for beverages, Mixing. C. W. Lloyd. 2,408,664; Oct. 1.
Feeder: *See*—
Poultry feeder.
Filaments, Resilient. F. G. Dodge. 2,408,381; Oct. 1.
Film cleaning device. B. E. Mills. 2,408,433; Oct. 1.
Film viewing device. R. W. Farrell. 2,408,384; Oct. 1.
Filter: *See*—
Air filter.
Fixture, Work holding. E. M. Strickland. 2,408,491; Oct. 1.
Flasher, Low voltage. C. H. McClure. 2,408,568; Oct. 1.
Flashlight. J. A. and J. P. Gits. 2,408,393; Oct. 1.
Flashlight for pedestrians and bicycle riders, Safety. J. A. Hoy. 2,408,643; Oct. 1.
Flint alloy. H. Kent. 2,408,400; Oct. 1.
Flow control valve. O. A. Kehle. 2,408,562; Oct. 1.
Fluid-displacing machines operating in parallel, Oscillating. E. S. Beale. 2,408,362; Oct. 1.
Fluid fountain for printing presses. G. M. Russell. 2,408,449; Oct. 1.
Fluid-solid contact surface. A. A. Griffith. 2,408,632; Oct. 1.
Fluid storage apparatus. J. H. Wiggins. 2,408,539; Oct. 1.
Fluorescent zinc oxide. C. A. Nickle. 2,408,475; Oct. 1.
Foam, Reducing or preventing. L. T. Monson. 2,408,527; Oct. 1.
Fog nozzle. T. J. Gothard. 2,408,511; Oct. 1.
Folding door. R. A. Miller and C. Howard. 2,408,525; Oct. 1.
Foot mechanism for sewing machines, Presser. B. T. Leveque. 2,408,523; Oct. 1.
Forced draft floor heater. W. M. Shaw. 2,408,691; Oct. 1.
Frame for articles of footwear, Supporting. W. H. Doherty. 2,408,413; Oct. 1.
Framed display, Collapsible. E. M. Roach. 2,408,532; Oct. 1.
Frequency converter. J. W. Clark. 2,408,410; Oct. 1.
Frequency multiplier. E. L. Ginston. 2,408,420; Oct. 1.
Frequency-variable oscillator circuit. W. van B. Roberts. 2,408,684; Oct. 1.
Friction composition product. F. J. Lowey and C. H. Tower. 2,408,430; Oct. 1.
Fruit treatment. A. M. Erickson and J. D. Ryan. 2,408,418; Oct. 1.
Game apparatus. E. B. Sanchez. 2,408,667; Oct. 1.
Garment for animals. A. Norvig. 2,408,575; Oct. 1.
Garment, One-piece. J. Weingarten. 2,408,537; Oct. 1.
Garment, Rain protective. B. A. Levitt. 2,408,662; Oct. 1.
Gas burner system. J. O. Moorhead. 2,408,673; Oct. 1.
Gauge: *See*—
Electric gauge.
Gauging and like apparatus, Distance. C. A. Donaldson. 2,408,415; Oct. 1.
Gearing, Antifriction. L. L. Mallard. 2,408,666; Oct. 1.
Gearing, Self-locking. F. Biehl and E. O. Thompson. 2,408,365; Oct. 1.
Glass composition. K. C. Lyon. 2,408,468; Oct. 1.
Glass structure, Laminated. F. A. Rodman. 2,408,483; Oct. 1.
Glass supporting skeleton mold. G. Z. Minton. 2,408,526; Oct. 1.
Globe and scale, World. R. A. Kiehl. 2,408,651; Oct. 1.
Grenade and fuse therefor, Hand. E. M. Shinkle. 2,408,486; Oct. 1.
Gun charger. G. A. Goepfrich. 2,408,624; Oct. 1.
Gun turret sighting compensation systems. G. W. Pontius, III, A. P. Wilson, and F. V. Kuzmits. 2,408,681; Oct. 1.
Gypsum lath, Perforating. L. N. Sorensen. 2,408,488; Oct. 1.
Hanger attachment, Garment. M. F. Smith. 2,408,697; Oct. 1.
Harmonic generating system. J. W. McRae. 2,408,437; Oct. 1.
Harp, Lamp. D. Leef. 2,408,522; Oct. 1.
Hat and making the same, Fabric. J. Cavanagh. 2,408,610; Oct. 1.
Heater: *See*—
Forced draft floor heater.
Water heater.
Heater for internal-combustion engines, Fuel. C. F. Brookes. 2,408,605; Oct. 1.
High-frequency apparatus. H. Benioff. 2,408,407; Oct. 1.
Hitch, Trailer. H. C. Riemann and J. R. Thorp. 2,408,531; Oct. 1.
Hold-down device, Adjustable. L. A. Splevak. 2,408,586; Oct. 1.
Holder: *See*—
Bobbin holder.
Concentricity gauge specimen holder.
Shirt collar holder.
Tool holder.
Holder for containers. A. Dawson. 2,408,611; Oct. 1.
Hydraulic relief valve. C. E. Tweedie. 2,408,708; Oct. 1.
Hydrocarbon conversion process. D. Read, Jr. 2,408,580; Oct. 1.
Hydrocarbon cracking process with successive additions of adsorbent. A. D. Smith. 2,408,584; Oct. 1.
Illuminating apparatus. G. S. Merrill. 2,408,471; Oct. 1.
Indication system, Remote. B. A. Lange. 2,408,660; Oct. 1.
Indicator: *See*—
Air-speed indicator.
Bowling pin setting indicator.
Inspection device, Smoke. R. H. Wager. 2,408,495; Oct. 1.
Instrument landing system. F. A. Jenks, D. F. Folland, A. S. Maeder, and W. T. Cooke. 2,408,425; Oct. 1.
Internal-combustion engine. L. L. Beltz. 2,408,598; Oct. 1.
Internal-combustion engine. J. L. Haight, Jr. 2,408,554; Oct. 1.
Internal combustion engine. M. Kadenacy. 2,408,399; Oct. 1.
Internal-combustion engines, Cooling system for. L. J. Chapeaulle, J. C. Kratzer, and E. E. Sommer. 2,408,374; Oct. 1.
Isomerization of normally liquid hydrocarbons. H. S. Bloch. 2,408,548; Oct. 1.
Jack: *See*—
Automobile jack.
Ketone aminoindan compensation product. C. F. Gibbs. 2,408,391; Oct. 1.
Knitting machine and knitting. N. H. Smith. 2,408,698; Oct. 1.
Lamp device, Multiflash. J. J. Malloy. 2,408,469; Oct. 1.
Lamp device, Multiflash. E. B. Noel and A. W. Seitz. 2,408,470; Oct. 1.
Lime, Manufacture of hydrated. H. N. Huntsicker and C. R. Norman, Jr. 2,408,647; Oct. 1.
Liquid storage apparatus. J. H. Wiggins. 2,408,538; Oct. 1.
Lock: *See*—
Safety pocket lock.
Loom. J. O. Hunt. 2,408,645; Oct. 1.
Lubricant, Drill. E. L. Flood. 2,408,385; Oct. 1.

Lubricating system for rock drills. O. J. Schorer. 2,408,524; Oct. 1.
Machine for grinding drills and similar tools. D. T. E. Fielding. 2,408,618; Oct. 1.
Machine for slotting screws. J. A. Rush. 2,408,686; Oct. 1.
Machine tool. J. R. Huntley. 2,408,646; Oct. 1.
Machinery, Textile. J. W. Tucker. 2,408,587; Oct. 1.
Magnesium metal and the like, Melting. E. C. Lyons. 2,408,466; Oct. 1.
Magnetic motor. C. P. Collins. 2,408,375; Oct. 1.
Manufacture of 4-keto-tetrahydrothiophenes. A. W. D. Avison, F. Bergel, and J. W. Haworth. 2,408,519; Oct. 1.
Marker, Point. C. L. Beard. 2,408,595; Oct. 1.
Marking machine. E. C. Horton. 2,408,516; Oct. 1.
Mattress. M. Dubick. 2,408,882; Oct. 1.
Measuring instrument, Pressure responsive. A. J. Rosenberger. 2,408,685; Oct. 1.
Mechanical movement. J. D. Bell. 2,408,546; Oct. 1.
Metal, Conditioning molten. E. C. Lyons. 2,408,467; Oct. 1.
Metalworking process and apparatus. C. W. Hazelett. 2,408,514; Oct. 1.
Metals with molten aluminum, Coating ferrous. H. N. Gilbert. 2,408,523; Oct. 1.
Methyl methacrylate compositions, Preparing of modified. F. L. Johnston. 2,408,426; Oct. 1.
Mixing plant. C. H. Johnson. 2,408,397; Oct. 1.
Mold: *See*—
Glass supporting mold.
Molding apparatus and method. L. B. Green. 2,408,629; Oct. 1.
Motive power, Steam. C. J. Surdy. 2,408,701; Oct. 1.
Motor: *See*—
Magnetic motor.
Motor control. C. Brongersma. 2,408,369; Oct. 1.
Motor driven signal. E. L. Williams. 2,408,590; Oct. 1.
Mounting and control mechanism, Gun. P. T. Tucker, W. G. Stewart, and J. H. Tanner. 2,408,707; Oct. 1.
Mud screen. F. E. Hutchison. 2,408,558; Oct. 1.
Multiplier, Electron. F. J. G. van den Bosch. 2,408,709; Oct. 1.
N,n-diethylbenzamide as an insect repellent. S. I. Gertler. 2,408,389; Oct. 1.
Necktie. A. F. Taborski and J. W. Terry. 2,408,455; Oct. 1.
Net, Torpedo. A. E. Brickman. 2,408,367; Oct. 1.
Net, Torpedo. H. W. Riddle. 2,408,482; Oct. 1.
Nipple applying instrument. M. H. Sidebotham. 2,408,693; Oct. 1.
Nitro compounds, Manufacture of. G. D. Buckley. 2,408,607; Oct. 1.
Nonchafing catamenial pad. J. P. Canavan. 2,408,508; Oct. 1.
Nut cracking machine. F. F. Feldmann. 2,408,510; Oct. 1.
Nut making machine, Lock. C. D. Tripp. 2,408,457; Oct. 1.
Nut, Sheet metal. E. M. Morehouse. 2,408,573; Oct. 1.
Object locating system. J. B. Hays, Jr. 2,408,395; Oct. 1.
Packaging. E. E. Eldredge. 2,408,616; Oct. 1.
Partition appliance, Cattle stall. L. C. Russell. 2,408,533; Oct. 1.
Patch for a fourdrinier wire, Preparing and applying a. J. A. Harris. 2,408,422; Oct. 1.
Percussive tool. A. R. Schwarzkopf. 2,408,484; Oct. 1.
Phosphors and their stabilization. H. C. Froelich. 2,408,621; Oct. 1.
Picker stick checking mechanism. W. Hamilton. 2,408,636; Oct. 1.
Pipe-cutting apparatus. P. A. Howard. 2,408,517; Oct. 1.
Plate clamp. W. L. Keehn. 2,408,560; Oct. 1.
Plate, Clutch. H. Nutt. 2,408,441; Oct. 1.
Plug: *See*—
Card terminal plug.
Self-latching electric plug
Sparking plug.
Polyvinyl alcohol composition. C. Dangelmajer. 2,408,377; Oct. 1.
Polyvinyl alcohol compositions to other materials, Adhering of. C. A. Porter. 2,408,682; Oct. 1.
Poultry feeder. R. T. Payne. 2,408,477; Oct. 1.
Press. L. F. Day. 2,408,379; Oct. 1.
Pressure producing device, Fluid. R. R. Gunderson. 2,408,513; Oct. 1.
Printing machine. F. L. Fuller. 2,408,622; Oct. 1.
Propeller spinner. F. M. Owner. 2,408,677; Oct. 1.
Protecting originative matter. L. B. Green. 2,408,626; Oct. 1.
Prothrombin product and preparation of same. H. P. Smith. 2,408,536; Oct. 1.
Pump: *See*—
Double-casing high-pressure pump.
Pump construction. E. S. Witchger. 2,408,716; Oct. 1.
Quinazolones from organic phosphazo compounds, Production of substituted. A. Guenther and J. F. Morgan. 2,408,633; Oct. 1.
Rail fastening. L. B. Green. 2,408,628; Oct. 1.
Receptacle for fluids. C. W. and G. M. Brandon. 2,408,505; Oct. 1.
Record controlled machine. V. O. Wilkerson. 2,408,715; Oct. 1.
Recording system, Race. E. Nassour. 2,408,528; Oct. 1.
Refrigerator. H. E. Rosebrook and H. F. Powell. 2,408,582; Oct. 1.
Refrigerator. H. van Doren. 2,408,460; Oct. 1.
Refrigerator, Bottle dispensing. F. U. Payne. 2,408,444; Oct. 1.
Relay of the fluid jet type, Mechanical. R. C. Braithwaite and K. Wilcox. 2,408,603; Oct. 1.
Relay of the fluid jet type, Mechanical. K. W. Tedd. 2,408,705; Oct. 1.
Release, Overload. F. J. Wright. 2,408,501; Oct. 1.
Reproducing system, Record. C. M. Sinnett and H. Belar. 2,408,695; Oct. 1.
Resins and production thereof, Cation exchange. J. R. Dudley. 2,408,615; Oct. 1.
Resins, Chlorinated. O. W. Cass. 2,408,608; Oct. 1.
Resins of high chlorine content. O. W. Cass. 2,408,609; Oct. 1.
Reversible clutch. T. S. Briskin, J. C. Zivny, A. E. Schellschmidt, and J. J. Golick. 2,408,506; Oct. 1.
Rivet, Self-setting tubular. H. J. Keating. 2,408,559; Oct. 1.
Roofing, Sheet metal. G. H. Huntington. 2,408,557; Oct. 1.
Rotating means for airplane landing wheels. H. Travis. 2,408,706; Oct. 1.
Roundabout. G. H. Pooler. 2,408,479; Oct. 1.
Safe screen support. J. Whalen. 2,408,714; Oct. 1.
Safety plug-in connector. C. A. Hasenwinkle. 2,408,556; Oct. 1.
Safety pocket lock. L. Schonthal. 2,408,688; Oct. 1.
Scratch-resistant articles, Forming. W. E. Williams. 2,408,540; Oct. 1.
Screen: *See*—
Mud screen.
Seal for adjoining railroad cars, Dust. C. P. Nelson. 2,408,473; Oct. 1.
Seismic apparatus and method. O. S. Petty. 2,408,478; Oct. 1.
Self-latching electric plug. L. Frank. 2,408,551; Oct. 1.
Semi-conducting composition. D. E. Edgar and D. J. Sullivan. 2,408,416; Oct. 1.
Service set, Bed. T. D. Crane. 2,408,550; Oct. 1.
Shade and making the same, Lamp. S. B. Bartha. 2,408,594; Oct. 1.
Sharpener, Twist drill. J. Banner. 2,408,544; Oct. 1.
Shield for transmitter mouthpieces, Noise. E. B. Newman and J. Miller. 2,408,474; Oct. 1.
Shirt collar holder. C. M. Mead. 2,408,569; Oct. 1.
Shoe tree. K. Barber. 2,408,545; Oct. 1.
Shoe, Water-resistant. G. H. Jennings. 2,408,650; Oct. 1.
Signal: *See*—
Motor driven signal.
Signaling system. H. Shore. 2,408,692; Oct. 1.
Siphon mechanism for heated rolls. H. W. Bruker. 2,408,606; Oct. 1.
Slicing machine. G. R. Wood. 2,408,717; Oct. 1.
Smoke screen composition and developing smoke screens therefrom. H. A. Levey. 2,408,429; Oct. 1.
Socket, Earphone. S. S. Stevens. 2,408,490; Oct. 1.
Socket, Earphone. P. S. Veneklasen. 2,408,494; Oct. 1.
Sparking plug. B. Hopps and C. J. Smithells. 2,408,642; Oct. 1.
Speed-control and synchronizing device. P. R. Price. 2,408,683; Oct. 1.
Speed control system. E. M. Sorensen. 2,408,451; Oct. 1.
Stapling machine. J. C. Lang. 2,408,563; Oct. 1.
Steels, Pickling. J. J. Healy, Jr., M. H. Taylor, and F. A. Abbiati. 2,408,424; Oct. 1.
Steering wheel. H. F. George. 2,408,388; Oct. 1.
Stencilling. J. T. Penton. 2,408,578; Oct. 1.
Stocking, Seamless. G. Norman. 2,408,440; Oct. 1.
Strip serving machine, Electrically controlled. C. E. Beckman and E. B. Dodds. 2,408,363; Oct. 1.
Stud or protector for boots and shoes. W. H. Lewis. 2,408,663; Oct. 1.
Stud remover, Broken. R. C. Schrader. 2,408,450; Oct. 1.
Sulphamic acid, Manufacture of. E. J. Tauch. 2,408,492; Oct. 1.
Support: *See*—
Safe screen support.
Surface coating apparatus. G. L. Dimmick. 2,408,614; Oct. 1.
Surfacing method and apparatus, Glass. G. B. Watkins and C. B. Schafer. 2,408,496; Oct. 1.
Suspender. J. La Frenier. 2,408,464; Oct. 1.
Switch and light for floor lamps, Combination. L. N. Mattson. 2,408,669; Oct. 1.
Switch and pistol-grip, Waterproof combined electric. A. A. Writsmann. 2,408,502; Oct. 1.
Tanning agents and treating hides and skins therewith. W. C. Ellenbogen. 2,408,417; Oct. 1.
Telephone system. M. E. Maloney. 2,408,432; Oct. 1.
Telephone system. W. A. Malthaner. 2,408,433; Oct. 1.
Telephone system. R. O. Wise. 2,408,462; Oct. 1.
Temperature control, Aircraft. H. T. Sparrow. 2,408,699; Oct 1.

Thermostat controlled alarm. P. Martin. 2,408,667; Oct. 1.
Thiophan-3-one and manufacture of same. P. Karrer. 2,408,518; Oct. 1.
Thromboplastin product and preparation of same. H. P. Smith. 2,408,535; Oct. 1.
Tiller, Rotary. J. P. Bagan. 2,408,361; Oct. 1.
Timber setting machine. H. S. Gay and T. V. Maynard. 2,408,387; Oct. 1.
Tin depositing process. A. G. Hopkins. 2,408,515; Oct. 1.
Tool: *See*—
Machine tool. Work illuminating tool.
percussive tool.
Tool holder. W. Mauch. 2,408,567; Oct. 1.
Toy holster for guns. H. Paley. 2,408,678; Oct. 1.
Traction unit for tractor wheels, Demountable. W. E. Wine. 2,408,591; Oct. 1.
Trailer, Dual axle. W. L. Keehn. 2,408,561; Oct. 1.
Trailer, Vehicle. E. F. King. 2,408,401; Oct. 1.
Transmission, Hydraulic T. L. Morris. 2,408,574; Oct. 1.
Transmission line, High voltage, high power concentric. A. P. Bock. 2,408,408; Oct. 1.
Trap: *See*—
Animal trap.
Trichloroethylene copolymers. H. W. Arnold. 2,408,402; Oct. 1.
Truck for rail vehicles. A. S. Krotz. 2,408,520; Oct. 1.
Tuning system for radio receivers, Automatic. C. M. Burrill. 2,408,370; Oct. 1.
Turret lathe headstock. R. Kurzweil. 2,408,658; Oct. 1.
Two-cycle engine. A. M. Rossman. 2,408,448; Oct. 1.
Typewriting machine, Shorthand. J. L. Stixrud. 2,408,452–3; Oct. 1.
Unit for electric chimes, Power. C. E. Waltman. 2,408,712; Oct. 1.
Vacuum distillation process and apparatus. K. C. D. Hickman. 2,408,639; Oct. 1.
Valve: *See*—
Charger valve. Hydraulic relief valve.
Flow control valve.
Vibrometer. D. E. Gillum and C. J. Gallant. 2,408,392; Oct. 1.
Vinyl aromatic compounds, Polymerization of. R. B. Seymour. 2,408,690; Oct. 1.
Watercraft and the like, Propulsion and stabilization of. H. M. Dobbins. 2,408,412; Oct. 1.
Water heater. H. B. Babson and C. A. Thomas. 2,408,403; Oct. 1.
Wave transmitting and receiving apparatus, Compressional. L. Batcheider. 2,408,404; Oct. 1.
Wax composition, Synthetic. M. M. Sprung. 2,408,700; Oct. 1.
Webs, Coating. S. Bergstein. 2,408,504; Oct. 1.
Well explosive device. J. L. Foster. 2,408,419; Oct. 1.
Wheel: *See*—
Steering wheel.
Wire or conduit clip. E. M. Morehouse. 2,408,572; Oct. 1.
Wire reinforced fabric. A. E. Brickman. 2,408,368; Oct. 1.
Work illuminating tool. B. Blauvelt. 2,408,601; Oct. 1.

CLASSIFICATION OF PATENTS

ISSUED OCTOBER 1, 1946

In view of the fact that the issue is being checked weekly by the Classification Division, the class and subclass in this list are correct as of this date. Where there is a discrepancy between the classification given in the patent head and the classification in this list, the classification of this list governs.

NOTE.—First number=class, second number=subclass, third number=patent number

U. S. GOVERNMENT PRINTING OFFICE: 1946

THE
OFFICIAL GAZETTE
OF THE
United States Patent Office

Vol 591—No. 2 TUESDAY, OCTOBER 8, 1946 Price—$16 per year

The OFFICIAL GAZETTE is mailed under the direction of the Superintendent of Documents, Government Printing Office, to whom all subscriptions should be made payable and all communications respecting the Gazette should be addressed. Issued weekly. Subscriptions, $16.00 per annum, including annual index, $18.75; single numbers, 35 cents each.
PRINTED COPIES OF PATENTS are furnished by the Patent Office at 25 cents each; copies of TRADE-MARKS and DESIGNS at 10 cents each. Address orders to the Commissioner of Patents, Washington 25, D. C.
CIRCULARS OF GENERAL INFORMATION concerning PATENTS or TRADE-MARKS will be sent without cost on request to the Commissioner of Patents, Washington 25, D. C.

Adverse Decisions in Interference

In interferences involving the indicated claims of the following patents final decisions have been rendered that the respective parties were not the first inventors with respect to the claims listed.

Pat. 2,360,707, I. E. Mouromtseff and G. M. Dinnick, Electron discharge device, decided Aug. 20, 1946, claim 3.

Pat. 2,375,007, R. G. Larsen and H. Diamond, Anti-foaming device, decided Aug. 30, 1946, claims 1, 3, 5, 6, 7, 9, 11, 12, 13, and 14.

Pat. 2,328,825, G. F. McMahon, Arc-extinguishing means, decided Sept. 6, 1946, claims 11, 22, and 23.

Disclaimers

2,315,656.—*Ralph Rhoda*, Berkeley, Calif. Dual Pressure Pumping System. Patent dated Apr. 6, 1943. Disclaimer filed June 18, 1946, by the assignee, *Berkeley Pump Company*, a partnership.

Hereby enters this disclaimer to claim 11 of said specification.

2,341,836.—*Harry F. Wood*, Kenosha, Wis. Piston. Patent dated Feb. 15, 1944. Disclaimer filed Sept. 12, 1946, by the inventor; the assignee, *Nash-Kelvinator Corporation*, acquiescing.

Hereby enters this disclaimer to claim 6 in said specification.

Notice of Cancellation

U. S. Patent Office, *Richmond, Va., Sept. 12, 1946.*

William Albert Fitzsimmons, his assigns or legal representatives, take notice:

A petition for cancellation having been filed in this Office by Anna-Jean Yuill, 1 N. La Salle St., Chicago, Ill., to effect the cancellation of trade-mark registration of William Albert Fitzsimmons, 226 W. 11th St., Newport, Ky., No. 263,008, dated October 29, 1929, and the notice of such proceeding sent by registered mail to the said Fitzsimmons at the said address having been returned by the post office undeliverable, notice is hereby given that unless said Fitzsimmons, his assigns or legal representatives, shall enter an appearance therein within thirty days from the first publication of this order the cancellation will be proceeded with as in the case of default. This notice will be published in the Official Gazette for three consecutive weeks.

LESLIE FRAZER,
First Assistant Commissioner.

Notice—Attorney's Address

Many letters are being returned to this Office for lack of street address. The attorney's full post-office address should be given in every power of attorney. The prompt delivery of communications will thereby be facilitated.

Condition of Applications Under Examination at Close of Business September 20, 1946

(Total number of applications awaiting action, excluding Trade-Mark Division, 123,917; Trade-Mark Division, 10,385. Oldest new case, April 5, 1945; oldest amended, April 3, 1945.)
(The dates given are 1945 except where † indicates 1946.)

Divisions, Examiners, and Subjects of Inventions	Oldest new application awaiting office action	Oldest amended application awaiting office action	No. of applications awaiting action
1. GOLDBERG, A. J., Food Apparatus; Closure Operators; Fences; Gates; Planters; Plows; Harrows and Diggers; Plant Husbandry; Scattering Unloaders; Baths, Closets, Sinks, and Spittoons; Sewerage.	May 19	May 29	2290
2 HERRMANN, D., Fishing, Trapping and Vermin Destroying; Bee Culture; Dairy; Animal Husbandry; Presses; Tobacco; Textile Wringers; Butchering.	June 13	June 18	2737
3. SCHIMMEL, J., Metal Founding; Metallurgy; Metal Treatment; Compositions (part)	May 19	June 9	1911
4. BISHOP, WALTER C., Conveyors; Hoists; Handling Apparatus; Excavating; Elevators; Fire Escapes; Ladders; Scaffolds; Package and Article Carriers; Pneumatic Dispatch; Store Service; Mining, Quarrying and Ice Harvesting.	Aug. 2	Aug. 24	2184
5. ROBINSON, C. W., Glass; Harvesters; Music; Acoustics; Sound Recording; Knotters; Buckles, Buttons, Clasps.	Apr. 12	May 1	3525
6. GENIESSE, E. W., Carbon Chemistry (part)	Oct. 10	Oct. 16	1727
7. HANLIN, GEORGE, Optics, Photography	June 30	Oct. 16	2009
8. IMUS, A. E., Furniture; Kitchen and Table Articles; Racks and Cabinets	July 18	July 26	2942
9. BENSON, R. B., Pumps and Fans; Fluid and Fluid-Current Motors	Apr. 18	Apr. 19	2023
10. ANDRUS, L. M., Radiant Energy (part, e. g., Portable Radio Sets, Radio Accessories, Detectors, Oscillation Generators, Wave Meters, Tuners); Modulators.	July 25	July 25	1485
11. BENHAM, E. V., Boots, Shoes, and Leggings; Button, Eyelet, and Rivet Setting; Harness; Leather Manufactures; Nailing and Stapling; Whip Apparatus.	†Feb. 7	†Feb. 9	663
12. SPINTMAN, S., Machine Elements (part); Engine Starters; Clutches and Power Stop Control	June 7	June 23	2433
13. BEALL, T. E., Gear Cutting, Milling, Planing, Metal Working (part); Needle and Pin Making; Turning	June 13	June 28	1966
14. FREEHOF, H. B., Metal Working (Bending; Sheet-Metal; Wire; Misc. Processes); Wire Fabrics; Farriery	Oct. 6	Sept. 21	1383
15. HENKIN, B., Natural Resins, Rubber (part); Proteins, Carbohydrates and Derivatives; Heterocyclic Compounds (part); Plastics.	May 25	Aug. 12	1196
16. LOVEWELL, N. N., Telegraphy; Telephony	Aug. 24	Aug. 30	1209
17. HABECKER, LEON B., Paper Manufactures; Printing; Type Casting; Sheet Material Associating or Folding; Sheet or Web Feeding; Type Setting.	Apr. 21	Apr. 4	1089
18. KURZ, J. A., Motors, Expansible-Chamber Type; Power Plants; Speed Responsive Devices; Rotary Internal Combustion Engines.	June 29	July 6	1735
19. PATRICK, P. L., Liquid and Gaseous Fuel Burners; Stoves and Furnaces	Oct. 10	Oct. 1	1552
20. BROWN, L. M., Miscellaneous Hardware; Closure Fasteners; Locks; Undertaking; Bread, Pastry, and Confection Making; Laminated Fabrics (part); Bank Protection; Safes.	June 15	June 13	1764
21. THOMPSON, T. J., Textiles	Nov. 1	Jan. 18	738
22. CARPENTER, B. H., Aeronautics; Firearms; Ordnance	Aug. 27	Sept. 15	1776

DECISIONS IN PATENT AND TRADE-MARK CASES

U. S. Court of Customs and Patent Appeals

IN RE PRUTTON ET AL.

No. 5,156. Decided June 11, 1946

[— F.(2d) —; 70 USPQ 196]

PATENTABILITY—LUBRICATING OILS.

The appealed claims *Held* unpatentable for reasons stated in the decision in companion appeal No. 5,157.

APPEAL from the Patent Office. Affirmed.

Messrs. Oberlin, Limbach & Day for Prutton et al.

Mr. W. W. Cochran (*Mr. E. L. Reynolds* of counsel) for the Commissioner of Patents.

BLAND, *J.*:

This appeal is a companion appeal to Patent Appeal No. 5157, handed down concurrently herewith. Both cases were briefed in one brief by the appellants and in separate briefs by the Solicitor for the Patent Office. The records are substantially identical and the references relied upon are the same in the two cases.

The claims in both cases are very similar except that the present claims are broader in that they call merely for an "organic halogen compound" instead of a halogenated hydrocarbon.

The claims are obviously not patentable if the claims in the companion case are not patentable, as we have held, and appellants do not insist that the claims of the instant application are allowable if certain claims in the companion appeal are not allowed.

For the reasons stated in our decision in the said companion appeal, the decision of the Board of Appeals in the instant case is affirmed.

Affirmed.

GARRETT, *P. J.*, sat during the arguments of this case, but because of illness took no part in its consideration or in the decision.

U. S. Court of Customs and Patent Appeals

IN RE PRUTTON ET AL.

No. 5,157. Decided June 11, 1946

[— F.(2d) —; 70 USPQ 193]

1. APPEAL—CLAIMS CONSIDERED.

"Claims 2, 4, 5, 8, 9, 20 to 23, and 25 have been rejected as not reading on elected species and hence need not be considered here."

2. PATENTABILITY—LUBRICATING OILS.

Claims to an improvement agent for mineral lubricating oils *Held* unpatentable over the prior art.

APPEAL from the Patent Office. Affirmed.

Messrs. Oberlin, Limbach & Day for Prutton et al.

Mr. W. W. Cochran (*Mr. E. L. Reynolds* of counsel) for the Commissioner of Patents.

BLAND, *J.*:

[1] Appellants have here appealed from the decision of the Board of Appeals of the United States Patent Office affirming the action of the Primary Examiner in finally rejecting claims 1 to 25, inclusive, in appellants' application for a patent on an alleged improved agent for lubricating oils. No claims were allowed. Claims 2, 4, 5, 8, 9, 20 to 23, and 25 have been rejected as not reading on elected species and hence need not be considered here.

The claims are all article or composition claims and were rejected by the Examiner upon two references, as follows: Prutton et al., 2,178,513, October 31, 1939; Lincoln et al., 2,264,319, December 2, 1941. Other grounds of rejection were placed upon certain claims which, in view of our conclusion, we need not consider.

Claim 1 was regarded by the Board as illustrative of the herein involved subject matter, and is so regarded by us, and follows:

1. As an improvement agent for mineral lubricating oils, a substantially homogeneous liquid composition, soluble in refined mineral lubricating oil, having a vapor pressure less than atmospheric at a temperature of 140° C., and consisting substantially entirely of (*a*) at least one halogenated hydrocarbon and (*b*) at least one organic sulphur compound.

The alleged invention, which may be fairly understood from a reading of the claims, is described by the Examiner as follows:

The present application relates in general to a compounded lubricating oil addition agent and more particularly to an addition agent comprising at least one halogen hydrocarbon and at least one organic sulphur compound.

Mineral lubricating oils normally have a relatively low film strength or load-carrying capacity and it has become conventional practice in the art to add various types of compounds to improve the extreme pressure characteristics of the oil. Sulphur and chlorine-bearing compounds have been found to be particularly effective for this purpose.

In the preparation of compounded lubricants employing several cooperative addition agents apparently the usual practice has been to separately add the addition agents by a conventional sequential blending process. It is said, however, that the sequential addition of separate addition agents is objectionable due primarily to the uneven blending secured.

In the present instance applicants propose to overcome this objection by forming a mixture of the addition agents and thereby obtain a concentrate which may be subsequently added to or diluted with mineral lubricating oil. The improvement agent or concentrate is blended with such oils in proportions ranging from about 1:100 to about 1:4.

The present addition agent consists substantially of (*a*) an organic halogenated hydrocarbon constituent and (*b*) an organic sulphur-containing constituent, the improvement agent advantageously having a vapor pressure less than atmospheric at a temperature of 140° C. and preferably at a temperature of 170° C. A list of suitable halogenated compounds appears on pages 6 to 8 and of suitable sulphur compounds on pages 8 to 20 of the specification.

The claims were all rejected, first, upon the Prutton et al. patent alone, and, second, upon the Lincoln et al. patent alone, both of which grounds of rejection were approved by the Board.

In rejecting the claims on the Prutton et al. patent, the Examiner stated:

Claims 1, 3, 6, 7, 10 to 19 and 24 are rejected as lacking invention over the patent to Prutton et al. which points out in the preparation of compounded lubricants the advantages of using in combination a halogenated and a sulphur-bearing compounds. Page 1, * * *, for example, discloses that:

"Particularly stated, this invention comprises the combined use as a lubricating composition of organic halogen bearing compounds and sulphur in active form; and the combined use of both such materials as addition agents to lubricating compositions which also contain a suitable lubricating oil such as mineral oil."

An extensive list of halogenated organic compounds, including chlorinated wax, appears on pages 1 and 2 of the patent. The list of sulfur compounds is not so extensive, it being stated in general that the sulphur may be present as elemental sulfur in solution or colloidal suspension or as sulphur-treated oils. Sulphur-treated oils are defined as:

"* * * any suitable oil base which has been treated with sulphur, for example, a composition produced by the heating of the sulphur with a fixed oil such as lard oil or fish oil or to which sulphur or a sulphur compound (e. g., diphenyl disulphide) has been added so that a certain amount of sulphur is present in active or loosely combined form."

The present claims differ essentially from the lubricating compositions described in the patent in that they omit the lubricating oil component, being directed essentially to a mixture of two types of addition agents. There is a definite suggestion in the patent, however, for the preparation of a composition consisting essentially of a mixture of a halogenated compound and sulphur of a sulphur-bearing compound. It is stated on page 3 of the patent that:

"The limit of the amount of the addition agents which may be added to the previously mentioned oil base and which will produce improved results depends, as above indicated upon the reduction in viscosity of the composition caused by the addition of such compounds. For particular uses and *when certain of the more viscous addition agents are employed such addition agents may be present in amounts up to 100%*.

"For example, chlorinated diphenyl ether has a sufficiently high viscosity especially when it contains more than 40% of combined chlorine so that it may be used as a lubricant in the pure state. Halogenated ring compounds of this nature are therefore suitable as a base to which to add the sulphur or sulphur-treated oil directly without any other oil base such as mineral oil to form one type of lubricating composition contemplated by this invention." [Emphasis added.]

Thus this patent definitely discloses a composition consisting essentially of a halogenated organic compound and a sulphur-bearing compound. While such a composition is intended to be used as a lubricant per se rather than as an addition agent, any limitation as to intended use is not regarded as a patentable one. See *In re Thuau*, 57 USPQ 324.

As pointed out above, the number of sulphur-bearing compounds listed in the patent is rather limited although reference is made to diphenyl-disulfide. No mention is made of "alkylated aromatic sulfides" as recited in claim 12 or more specifically, "a halogen-substituted dibenzyl disulfide" recited in claim 24. The present specification lists on pages 8 to 20 an almost endless number of examples of sulphur-bearing compounds said to be suitable for the purpose in question. In the absence of evidence to the contrary, the sulphur-bearing compounds disclosed in the patent are regarded as the full equivalent of the specific compounds covered by claims 12, 13, 15 to 19 and 24. The rejection is therefore deemed sound.

In rejecting the claims on the Lincoln et al. patent, the Examiner said:

The appealed claims are further rejected as lacking invention over the Lincoln patent which discloses a lubricating composition containing a halogen-bearing and a sulphur-bearing compound. This patent * * * discloses that in making blended lubricants containing a mixture of addition agents, the addends may be mixed together first and then added to the lubricating oil. Among the sulphur-bearing addition agents listed is chlorobenzyl disulfide. However, as urged above, the specific addition agents blended are subjected to wide variation and not considered to amount to invention since this represents, at best, a matter of individual selection.

In conclusion, the Examiner stated:

Applicant appears to have merely followed the teaching of the prior art in compounding an improvement agent of the type defined in the appealed claims intended to be added to lubricating oils. It is submitted that patent protection thereon should accordingly be denied.

These views expressed by the Examiner are substantially the views of the Board, although the Board did not find it necessary to so exhaustively treat the question. The Board said in part:

Claims 1, 3, 6, 7, 10 to 19, inclusive, and 24 stand rejected as lacking invention over the patent to Prutton et al. which is relied upon by the Examiner as pointing out certain advantages in using a halogenated and a sulphur-bearing compound in combination. The patentees disclose halogenated hydrocarbons as well as organic sulphur compounds to be added to mineral oils to produce lubricating compositions of the extreme pressure type to which the present invention is addressed.

* * * We have given careful consideration to this rejection in the light of appellants' remarks in their brief and we reach the conclusion that the rejection as stated by the Examiner is proper and should be sustained.

The claims stand further rejected as lacking invention over the patent to Lincoln et al. which is relied upon as disclosing a lubricating composition containing a halogen-bearing and a sulphur-bearing organic compound in which the composition consists essentially of these two components. Lincoln et al. state in their specification that in making blends of the type with which this patent is concerned the addends may be mixed together first and then added to the oil as appellants here do, or one addend may be combined with the oil after which the second may be blended in, which appears to have been common practice in the prior art according to appellants' arguments. In view of the wide variation to which the blending agents are subject, it was the Examiner's view that the blending of specific halogenated hydrocarbons with specific organic sulphur compounds did not amount to invention but represented nothing more than a matter of individual selection.

* * * It is * * * our conclusion that the claims stand properly rejected on the Lincoln et al. patent for the reasons * * * pointed out by the Examiner in his statement and this rejection will also be sustained.

Appellants contested before the tribunals below the propriety of using the Lincoln et al. patent as a reference in view of certain affidavits filed seeking to overcome said reference under rule 75 of the Rules of Practice of the United States Patent Office and much of the discussion in the brief of appellants and that of the Solicitor for the Patent Office is devoted to the question as to whether or not the affidavits sufficiently warrant the withdrawal of the Lincoln et al. patent as a reference. We have carefully considered the arguments concerning the Lincoln et al. patent and while we are not impressed with the contentions of the appellants with respect thereto we find it unnecessary to consider this reference in view of the fact that we are of the opinion that the rejection on the part of the Examiner, which was approved by the Board, on the patent to Prutton et al. was sound.

The Lincoln et al. patent was cited for the purpose of showing that the addition agents may be mixed before they are added to the lubricating oil, as is done in the instant application. It is our view that the disclosure of Prutton et al. (the inventors therein being two of the alleged inventors in the instant application) are such that no patentable improvement thereover is disclosed in the instant application. It would seem to be simply a matter of choice whether the addition agents were first mixed and then added to the oil or whether the procedure outlined in the Prutton et al. patent was followed. Even if improved results flowed from mixing the addition agents before contacting the oil, the record does not disclose that such results are so unexpected or of such importance under the circumstances as to indicate invention.

In this view it is unnecessary for us to consider the Lincoln et al. patent and we have quoted the portions of the decisions of the tribunals below with reference to the application of the Lincoln et al. patent merely for the purpose of presenting the whole picture.

The Prutton et al. patent discloses a lubricant containing halogenated hydrocarbons and sulphur. There is nothing new about the use of these with a lubricating composition and they may be used alone as a lubricant. The sulphur may be in the form of a compound such as diphenyl disulfide.

In their brief appellants state:

Their prior patent relates to lubricating compositions containing a major proportion of mineral lubricating oil and minor proportions of separate halogen and sulphur compounds. They had discovered the cooperative effect between halogen and sulphur referred to above. That broad concept is not, however, the concept of a specific additive as defined by the present claims. In their prior patent Prutton and Smith taught broadly that when halogen and sulphur are present in combination in a lubricant, there is an unexpected cooperative effect. *In the present cases, these same inventors, with a third joint inventor, make the further contribution to the art by teaching that when, in this broad field of use of halogen and sulphur compounds, one prepares additive materials of particularly selected representative examples of each broad class, so that one has a liquid homogeneous mass, and then, after such liquid homogeneous mass has been prepared, adds it to the oil base, an unexpected result is scoured.* [Italics supplied.]

It seems that appellants argue here that because they have picked out from their disclosed additive ingredients "particularly selected representative examples of each broad class, so that one has a liquid homogeneous mass," they have improved the art in a patentable sense. In other words, it is argued that since Prutton and Smith have had a patent relating to the many halogenated hydrocarbons, including chlorinated paraffin wax, which is included in appellants' preferred species, the appellants are now entitled to another patent for taking the same materials and selecting from those materials those that will bring about the best results.

The Solicitor makes the point that the Prutton et al. patent discloses the exact composition covered by appealed claim 1 and that "while the patentees intend to use the composition alone, instead of mixing it with other lubricants, this is not a patentable distinction in view of the conventional practice of using various lubricating materials alone or in mixtures."

The Solicitor further states, with reference to the changes on various halogenated hydrocarbons and organic sulphur compounds covered in the other claims, that "the number of these claimed, and the much larger number disclosed as suitable in appellants' specification clearly show that there is nothing critical about any of them; and there is no evidence of record that any one of them is unexpectedly superior to the others. Accordingly, the specific claims are unpatentable for the same reasons as the broader claim 1."

We agree with the conclusion reached by the Patent Office tribunals and with the said statements of the Solicitor. The question does not seem to us to be a close one, and no extended discussion of the many arguments in appellants' brief, of which we have made careful note, need be entered into here.

[2] We are in agreement with the holding of the Board of Appeals, and its decision affirming that of the Examiner in rejecting the appealed claims is affirmed.

Affirmed.

GARRETT, *P. J.*, sat during the arguments of this case, but because of illness took no part in its consideration or in the decision.

U. S. Court of Customs and Patent Appeals

IN RE MCGEORGE ET AL.

No. 5,172. Decided June 11, 1946

[— F.(2d) —; 70 USPQ 210]

PATENTABILITY—STOMACH POWDERS AND PREPARATION.

"The decision of the Board of Appeals is modified, being affirmed as to claims 2, 9, 18, and 25, and reversed as to claims 5 and 6, which, we think, are patentable over the prior art cited, and, owing to the fact that claims 5 and 6 are generic claims, the decision of the Board is also reversed so far as it held that claims 7, 8, and 19 to 24, inclusive, were properly rejected by the Primary Examiner on the ground that they were drawn to a non-elected species."

APPEAL from the Patent Office. Modified.

Mr. Irvin S. Thompson for McGeorge et al.

Mr. W. W. Cochran (*Mr. E. L. Reynolds* of counsel) for the Commissioner of Patents.

HATFIELD, *J.*:

This is an appeal from the decision of the Board of Appeals of the United States Patent Office affirming the decision of the Primary Examiner rejecting all of the claims (Nos. 1 to 10, inclusive, and 18 to 27, inclusive) in appellants' application for a patent for an alleged invention relating to so-called "Stomach powders," and a process for making the same.

At the time of the oral arguments in this court, counsel for appellants moved to dismiss the appeal as to claims 1, 3, 4, 10, 26, and 27. The motion will be granted.

Claims 7, 8, 10, and 19 to 24, inclusive, were rejected by the tribunals of the Patent Office as being drawn to non-elected species. They, therefore, need not be considered here on their merits.

Claims 2, 5, 6, 9, and 25 are process claims and were rejected by the Primary Examiner on the prior art.

Claim 18 is for appellants' product and was also rejected on the prior art.

Claim 2, which is illustrative of claim 9, and claims 5, 6, and 18 which are before us on their merits read:

2. A process for the preparation of a stomach powder base comprising mixing a solution containing not more than 100 parts by weight of sodium carbonate in 230 parts by weight of water, with a solution of calcium chloride and magnesium chloride containing calcium and magnesium in the proportions desired in the product and at the rate of not more than 100 parts by weight of the two chlorides in 155 parts by weight of water, the quantity of the sodium carbonate solution being in excess of the theoretical quantity required for precipitating the calcium and magnesium, and digesting the mixture at a raised temperature for a period of time to convert the precipitate into a finely divided form which rapidly settles in the absence of agitation, and then washing and drying the precipitate.

5. In a process for the preparation of the carbonate salts of calcium and magnesium, wherein a solution containing both calcium and magnesium salts is prepared from a material containing both calcium and magnesium in carbonate form by means of an acid and is mixed with a water-soluble carbonate salt in aqueous solution for a duration and at elevated temperatures resulting in the co-precipitation of both calcium and magnesium in carbonate form and in a finely divided and intimately mixed condition, the steps of dissolving 184 grms. of dolomite in 456.3 grms. of 32% hydrochloric acid and making the volume up to 1980 mls. to form the solution of the mixed carbonates and dissolving 223 grms. of anhydrous sodium carbonate in water to a final volume of 1980 mls. to give the aqueous solution of the water-soluble carbonate.

6. A process for the preparation of the carbonate salts of calcium and magnesium, wherein dolomite is dissolved in 32% hydrochloric acid at the rate of 184 grms. of

dolomite to 456.3 grms. of acid, and the volume is made up with water to a total of 1980 mls. per 184 grms. of dolomite; and anhydrous sodium carbonate is dissolved in water to give a solution containing 223 grms. per 1980 mls; and taking equal volumes of the solutions thus obtained, approximately 1% by volume of each solution is added to the remainder of the other solution, the two mixtures heated separately to 70° C. and filtered, whereafter the filtrates are caused to interact to give the co-precipitation of both calcium and magnesium in carbonate form and in a finely divided and intimately mixed condition.

18. As a new composition of matter, a precipitation product comprising finely divided and intimately mixed carbonate salts of magnesium and calcium and less than 10% occluded sodium.

The references are: Mellor—Comprehensive Treatise on Inorganic and Theoretical Chemistry, Vol. 4, pages 372, 375 (1923); Gutman—Modern Drug Encyclopedia (1934), page 347; U. S. Dispensatory, 21 Ed. (1926), pages 251, 667, 668.

The purpose of appellants' process is to produce a stomach powder by co-precipitation of calcium and magnesium in carbonate form and in a finely divided and intimately mixed condition.

According to claim 2, appellants' process comprises mixing a sodium carbonate solution with a calcium chloride and magnesium chloride solution, the chlorides being in the proportions stated in the claim and the quantity of sodium carbonate solution being in excess of the amount required for precipitating the calcium and magnesium, "digesting the mixture at a raised temperature for a period of time to convert the precipitate into a finely divided form which rapidly settles in the absence of agitation, and then washing and drying the precipitate."

In other words, by the process described in claim 2, calcium chloride and magnesium chloride are converted into calcium and magnesium carbonates by a solution of sodium carbonate.

It will be observed that there is nothing in claim 2 which calls for co-precipitation of the calcium and magnesium in carbonate form which is the gist of appellants' invention, as stated in their application and as claimed here in the brief of counsel for appellants.

The Primary Examiner rejected claim 2 as being unpatentable over the disclosures in the references Mellor and U. S. Dispensatory, supra. In so doing, the Examiner relied upon the following statement in the Mellor treatise: "According to T. S. Hunt, sodium hydrocarbonate [bicarbonate] precipitates *at first* almost wholly calcium carbonate from a mixed soln. of calcium and magnesium chlorides; and then follows hydrated magnesium carbonate" [italics not quoted], and stated that the U. S. Dispensatory discloses that washing and drying of precipitates of the carbonates is conventional; that so-called "digestion," after precipitation, "is a well known process step, as shown by the Dispensatory, page 668"; and that the same authority discloses that it is old to use high temperatures in the precipitation of carbonates.

The Examiner also rejected claim 18, the product claim, on the disclosures in the Mellor and Gutman references.

The Gutman reference discloses a composition consisting of 50% of magnesium carbonate and 50% of calcium carbonate. Just how the reference product is prepared is not stated. However, there is nothing of record to indicate that the components of the product are not finely divided and intimately mixed.

It will be observed from claim 5 that appellants' process, as therein defined, comprises the preparation of carbonate salts of calcium and magnesium by first converting the carbonate salts of calcium and magnesium into calcium and magnesium chlorides by means of an acid, as stated in that claim, or hydrochloric acid, as stated in claim 6. Thereafter the chlorides are mixed "with a water-soluble carbonate salt in aqueous solution" at elevated temperatures, resulting, as stated in claim 5, in the "*co-precipitation of both calcium and magnesium in carbonate form and in a finely divided and intimately mixed condition.*" [Italics not quoted.] Claim 6 defines a similar process. Each of those claims contains limitations as to the proportions of the various ingredients used in appellants' process.

Although claims 5 and 6 were rejected by the tribunals of the Patent Office on the disclosure in the Mellor reference, wherein it is stated that dolomite is soluble in several acids and that T. S. Hunt precipitated calcium carbonate and magnesium carbonate from a mixed solution of calcium and magnesium chlorides by means of sodium bicarbonate, it clearly appears from the Mellor disclosure that Hunt produced in sequence, first calcium carbonate and then magnesium carbonate. It does not appear that he produced those carbonates simultaneously by co-precipitation, as called for by claims 5 and 6.

It is apparent that by co-precipitation in the processes defined in claims 5 and 6, which are generic claims, a more intimate mixture of calcium and magnesium carbonates would be obtained than by successive precipitation of those substances. That, in our opinion, is appellants' contribution to the art. We hold, therefore, that claims 5 and 6 define patentable subject matter over the art of record.

Claim 25 is somewhat similar to claims 5 and 6, except that it is not limited to co-precipitation of calcium and magnesium carbonates.

The appeal is dismissed as to claims 1, 3, 4, 10, 26, and 27.

For the reasons stated, the decision of the Board of Appeals is modified, being affirmed as to claims 2, 9, 18, and 25, and reversed as to claims 5 and 6, which, we think, are patentable over the prior art cited, and, owing to the fact that claims 5 and 6 are generic claims, the decision of the Board is also reversed so far as it held that claims 7, 8, and 19 to 24, inclusive, were properly rejected by the Primary Examiner on the ground that they were drawn to a non-elected species.

Modified.

GARRETT, *J. P.*, sat during the arguments of this case, but because of illness took no part in its consideration or in the decision.

U. S. Court of Customs and Patent Appeals

IN RE SEAVEY

No. 5,182. Decided June 11, 1946. Petition for rehearing denied July 9, 1946

[— F.(2d) —; 70 USPQ 214]

1. PATENTABILITY—INVENTION.
   Where there was a clear suggestion in a reference patent that if a plastic material of sufficient strength could be discovered, it would be a suitable material to be used in making detonator shells, *Held* that the discovery of an organic plastic material having the necessary characteristics would, in view of the disclosure in the patent, "be a mere routine investigation and would not involve invention"; and *Held* that this view was confirmed by the unchallenged statement of the Primary Examiner that the properties of various organic plastics, including their impact strength, were well known in the art prior to the filing of appellant's application.
2. SAME—NON-ELECTED SPECIES.
   "As no generic claim has been allowed, claims 8 and 10, which were drawn to non-elected species were properly rejected in the involved application."
3. SAME—DETONATOR SHELL.
   Certain claims to a detonator shell *Held* unpatentable over the prior art.

APPEAL from the Patent Office. Affirmed.

Mr. John H. Sutherland (*Mr. Richard G. Radue* of counsel) for Seavey.

Mr. W. W. Cochran (*Mr. Pasquale J. Federico* of counsel) for the Commissioner of Patents.

HATFIELD, *J.*:

This is an appeal from the decision of the Board of Appeals of the United States Patent Office affirming the decision of the Primary Examiner rejecting claims 1, 2, 3, and 6 to 10, inclusive, in appellant's application for a patent for an invention relating to electric detonators, particularly those employed "for initiating the explosion" of explosives in blasting operations.

Claims 11 and 19 were allowed by the Primary Examiner.

At the time of the oral arguments in this court, counsel for appellant moved to dismiss the appeal as to claim 6. The motion will be granted.

Claims 8 and 10 were rejected as being drawn to non-elected species and, therefore, need not be considered here on their merits.

Claim 1, which is a generic claim, and claim 9, which is drawn to an elected species, are sufficiently illustrative of the claims here on appeal. They read:

1. A rigid detonator shell composed of molded organic plastic having an impact strength of at least 0.75 foot pounds.

9. A rigid detonator having a shell composed of plasticized ethyl cellulose, and a plug for said shell composed of polystyrene; said plug sealing the shell and being intimately bonded therewith.

The Primary Examiner relied upon the following references: Mowbray, 139,686, June 10, 1873; Paulus, 323,524, Aug. 4, 1885; Ward et al., 459,321, Sept. 8, 1891; Mellersh-Jackson (British), 17,443, of 1915; Eschbach et al. (British), 310,364, Apr. 22, 1930; von Herz (British), 382,247, Oct. 20, 1932.

The appealed claims were rejected by the Primary Examiner on the patents to Mowbray and von Herz, and claim 9 was further rejected on the patent to von Herz in view of the patent to Mowbray. The other references of record were cited against claim 6, which is not now before us, and claim 21, which was not included in appellant's reasons of appeal. Accordingly, the only references which need be considered here are the patents to Mowbray and von Herz.

Appellant's detonator comprises a hollow cylindrical shell of molded organic plastic material, having, as stated in claim 1, "an impact strength of at least 0.75 foot pounds," and containing an explosive charge. The open end of the shell is closed by a plug of molded plastic material, such as polystyrene, called for in quoted claim 9. The plug carries an electric ignition device for igniting the charge, and also the necessary wires for conducting current to the ignition device. The plug and shell are intimately bonded together by a volatile solvent. It is stated in appellant's application that a great variety of moldable plastic materials are suitable for making the shell and the plug.

The patent to Mowbray relates to improvements in electric fuses, and discloses a detonator comprising a composite shell having an inner copper lining and an outer coating of gutta-percha, the gutta-percha coating being molded over the copper lining. The open end of the shell is closed by a plug of gutta-percha which carries the ignition device and the necessary wires therefor. The plug and shell are cemented together by a suitable solution of gutta-percha, thus forming an intimate bond between the shell and the gutta-percha plug.

The patent to von Herz relates to detonating cap casings, and discloses a detonating cap casing composed, according to the patentee, of "vulcanised fibre," which "is made by subjecting cellulose which has been swollen and partially dissolved by means of zinc chloride or other substances to the action of high pressure and heat." The patentee states that—

> A particular advantage of using vulcanised fibre is that the attachment to the fuses of the detonating caps made therefrom may be effected in precisely the same way as in the case of metal casings, i. e. *by contracting or pinching with pincers or the usual apparatus* * * * [and that] the casing of vulcanised fibre maintains the shape given to it by the profile of the pincers, in spite of the counteracting elasticity of the fuse, and so a union is ensured the strength and certainty of which undergoes no change even after months. [Italics not quoted.]

The patentee further states that—

> Even the most diverse artificial substances like Celluloid, Cellon, artificial resins, etc., have been tried as material for the casings. These attempts, however, have not met with any success, on the one hand owing to the deficient strength of most of these substances, which latter therefore do not provide the sensitive igniting charge with sufficient protection against compression * * *.

In rejecting the appealed claims, the Primary Examiner stated that they were unpatentable over the patent to Mowbray, owing to the fact that the patentee discloses the molding of an organic plastic material, such as gutta-percha, over a copper lining; that there would be no invention in omitting the lining if it were desired to do so; and that, furthermore, as the properties of various plastics,

including their impact strength, were well known, it would not involve invention to select an organic plastic material having an impact strength of at least 0.75 foot pounds to be used in making a rigid detonator shell. The Examiner also rejected the appealed claims on the patent to von Herz, stating that the patentee discloses that detonator shells have been made of Celluloid, Cellon, and artificial resins and that, although the patentee stated that such materials had been found deficient in strength, it would not involve invention for one skilled in the art to select a moldable organic plastic material which had an impact strength of at least 0.75 foot pounds, as called for by appealed claims 1, 2, and 3.

Claim 9, which calls for the intimate bonding of the plastic shell and plastic plug for the detonator, was rejected by the Primary Examiner on the disclosure in the patent to von Herz in view of the disclosure in the patent to Mowbray, the Examiner stating that the patent to Mowbray discloses the "intimate bonding of a plastic shell and plastic plug," and that there would be no invention in "bonding plastics together to make sealed joints."

In affirming the decision of the Primary Examiner, the Board of Appeals stated that the patent to von Herz was the most pertinent reference; that the patentee referred to the advantages in using organic "vulcanised fibre," which, the Board stated, could be "molded to the fuse"; that it did not regard the impact strength of appellant's detonator shell of at least 0.75 foot pounds as critical; and that the determination of such strength was the "result of routine investigation."

Although it is alleged in the brief of counsel for appellant that the impact strength of at least 0.75 foot pounds, called for by appealed claims 1, 2, and 3, is critical, there is nothing whatsoever in the record to indicate that that is a fact. Obviously, in using plastics, it was necessary for appellant to experiment in order to ascertain the impact strength necessary for a detonator shell.

It is contended by counsel for appellant that the Board erred in holding that the "vulcanised fibre," disclosed in the patent to von Herz, is a moldable material within the meaning of that term as used in appellant's application. In support of his argument, counsel cites "Ellis, The Chemistry of Synthetic Resins, 1935 Edition, p. 1294."

[1] Whether the "Vulcanised fibre," which the patentee von Herz used as a material in making his detonating cap casing, is a moldable material in the sense that organic plastic material may be molded need not be decided here. Although the patentee states, as hereinbefore noted, that artificial resins (organic plastics) have been used as a material for making detonator casings, he further states that the use of such resins was not successful, owing to the fact that they did not possess sufficient strength. However, there is a clear suggestion in the patent that if a plastic material of sufficient strength could be discovered, it would be a suitable material to be used in making detonator shells. See *In re Lloyd E. Smith*, 32 C. C. P. A. (Patents) 959, 148 F.(2d) 351, 65 USPQ 167, 578 O. G. 447.

We are of opinion that, although the patentee von Herz had not discovered an organic plastic material which possessed sufficient rigidity and strength to make it suitable for use in making detonator shells, the discovery of an organic plastic material having the necessary characteristics would, as stated by the Board, in view of the disclosure in the von Herz patent, be a mere routine investigation and would not involve invention. We are confirmed in this view by the Primary Examiner's statement to the Board of Appeals that the properties of various organic plastics, including their impact strength, were well known in the art prior to the filing of appellant's application, which statement of the Examiner is not questioned here by counsel for appellant.

Claim 9, which calls for a plug, composed of an organic plastic material (polystyrene), sealing the shell and being intimately bonded therewith, was properly rejected by the Primary Examiner on the disclosure in the patent to von Herz in view of the disclosure in the patent to Mowbray.

The appeal is dismissed as to claim 6.

[2] As no generic claim has been allowed, claims 8 and 10, which were drawn to non-elected species, were properly rejected in the involved application.

[3] For the reasons stated, the decision of the Board of Appeals, affirming the decision of the Primary Examiner rejecting claims 1, 2, 3, 7, and 9 on the references of record, is affirmed.

Affirmed.

GARRETT, *P. J.*, sat during the arguments of this case, but because of illness took no part in its consideration or in the decision.

U. S. Court of Customs and Patent Appeals

IN RE PINKERTON

No. 5,192. Decided June 11, 1946

[— F.(2d) —; 70 USPQ 232]

PATENTABILITY—MOTOR FUEL.

In the absence of a showing that the specified steps are critical, claims to a process of producing motor fuel *Held* unpatentable over the prior art.

APPEAL from the Patent Office. Affirmed.

Messrs. Pennie, Davis, Marvin & Edmonds (*Mr. Louis D. Forward* and *Mr. Clarence M. Fisher* of counsel) for Pinkerton.

Mr. W. W. Cochran (*Mr. E. L. Reynolds* of counsel) for the Commissioner of Patents.

HATFIELD, *J.:*

This is an appeal from the decision of the Board of Appeals of the United States Patent Office affirming the decision of the Primary Examiner rejecting the claims (Nos. 1 and 2) in appellant's application for a patent for an alleged invention relating to the production of motor fuel by "the alkylation of butylenes with isobutane in the presence of" a catalyst, such as sulphuric acid.

The appealed claims read:

1. In the production of motor fuel by the alkylation of butylenes with isobutane in the presence of strong sulfuric acid with intimate admixture of the hydrocarbon and acid in a reaction zone, the steps of separately cooling of the acid and hydrocarbon to temperatures substantially below the temperature of the mixture of acid and hydrocarbon before the acid and hydrocarbon feed are brought into contact with each other or with the reaction mixture.

2. The process as in claim 1, in which the acid and hydrocarbon are cooled to a temperature about 20° F. or more below that of the mixture of acid and hydrocarbon undergoing reaction in the reaction zone.

The references are: Pyzel, 2,232,674, February 18, 1941; Altshuler et al., 2,238,802, April 15, 1941; Parker, 2,286,504, June 16, 1942.

The alleged invention is sufficiently described in the appealed claims.

The claims were rejected by the Primary Examiner on each of the reference patents, and his rejection was affirmed by the Board of Appeals.

Each of the reference patents discloses the catalytic treatment of hydrocarbons in a reaction zone by acids at a reduced temperature.

Owing to the views we hold, it is unnecessary that we here describe the disclosures in the patents to Pyzel and Parker, as we are of opinion that the claims are unpatentable in view of the disclosure in the patent to Altshuler et al.

The patent to Altshuler et al. relates to a process of producing motor fuel by reacting butylenes with isobutane in the presence of a catalyst (sulphuric acid) in a reaction zone, and discloses the cooling of the hydrocarbons prior to the mixture of the same with the catalyst.

None of the references discloses the cooling of the catalyst prior to its contact with the hydrocarbons, whereas the appealed claims call for "separately cooling of the acid and hydrocarbon to temperatures substantially below the temperature of the mixture of acid and hydrocarbon before" they are brought into contact with each other.

It was the view of the Board of Appeals that, although the hydrocarbon and the catalyst are cooled separately in appellant's process substantially below the temperature of the mixture of acid and hydrocarbon before they are brought into contact, as called for by claim 1, and are cooled separately to a temperature of about 20° F. or more below the mixture of acid and hydrocarbon, as called for by claim 2, the cooling of the hydrocarbon, as disclosed in the patent to Altshuler et al., would obviously, to some extent, cool the catalyst (sulphuric acid) when the two are brought into contact, and that as there is nothing of record to indicate that the cooling of the hydrocarbon and acid separately, or the degree to which they are cooled, is critical or would bring about an unexpected result, the claims do not define patentable subject matter in view of the prior art disclosures.

Although the appealed claims call for the cooling separately of the acid and the hydrocarbon, appellant states in his application that if the isobutane and olefin are separately supplied and the acid and the olefin portion of the hydrocarbon are cooled separately, the object of his invention will be carried out.

The theory of appellant is that the separate cooling of the catalyst and the hydrocarbon before admixture to a temperature sufficiently below that used in the reaction zone is such that the reaction does not raise the temperature substantially above that desired to be maintained in the reaction chamber; that such process is not disclosed in the prior art; that his process brings about an improved result; and that, therefore, the claims are patentable over the references of record.

It may be, as agued by counsel for appellant, that appellant's process is an improvement over the prior art. However, there is nothing in appellant's application to indicate either that the cooling of the catalyst and hydrocarbon separately, or that the cooling of each substance below the temperature of the mixture before they are brought into contact, is critical. Nor is there anything of record to indicate that the cooling of the acid and the hydrocarbon to a temperature of "about 20° F. or more below that of the mixture of acid and hydrocarbon undergoing reaction in the reaction zone," as called for by appealed claim 2, is critical.

We have given careful consideration to the arguments of counsel for appellant, but are of opinion, as were the tribunals of the Patent Office, that the appealed claims are not patentable over the references of record. Accordingly, the decision of the Board of Appeals is affirmed.

Affirmed.

GARRETT, *P. J.*, sat during the arguments of this case, but because of illness took no part in its consideration or in the decision.

U. S. Court of Customs and Patent Appeals

IN RE DRISSNER ET AL.

No. 5,198. Decided June 11, 1946

[— F.(2d) —; 70 USPQ 236]

1. CLAIMS—FUNCTIONAL LIMITATIONS.
"Apparatus claims must, in order to be patentable, distinguish over the prior art in terms of structure. They cannot be held to be patentable merely on the basis of functional limitations."

2. PATENTABILITY—INVENTION—HOUSINGS.
"Housings for various parts of a machine do not involve patentable subject matter."

3. SAME—SINGLE SPINDLE AUTOMATIC SCREW MACHINE.
In appellants' application on a single spindle automatic screw machine, one appealed claim *Held* patentable over the prior art, but the remaining appealed claims *Held* unpatentable.

APPEAL from the Patent Office. Modified.

Mr. C. A. Weed for Drissner et al.

Mr. W. W. Cochran for the Commissioner of Patents.

HATFIELD, *J.:*

This is an appeal from the decision of the Board of Appeals of the United States Patent Office affirming the decision of the Primary Examiner rejecting claims 20, 44, 45, 73, 84, 85, 86, 87, and 90

to 102, inclusive, in appellants' application for a patent for an invention relating to improvements in "single spindle automatic screw machines."

Twenty-seven claims have been allowed by the Primary Examiner.

Claims 20, 44, 73, 84, 90, 91, 92, 94, 95, and 96 are illustrative of the appealed claims. They read:

20. In a metal working machine having a rotary spindle and cooperating tool mechanism, a series of cross slides encircling said spindle, means for feeding bar stock through the spindle and including finger holding mechanism having a double toggle provided with a roller at the junction of the toggle levers, and a pair of relatively shiftable socketed members for receiving the opposite ends of said levers, the diameter of the roller being such that the distance between the opposing faces of said shiftable socketed members when shifted toward each other is but slightly greater than the diameter of the roller.

44. An automatic single spindle screw machine comprising a single rotary work spindle, mechanism for rotating it, feeding and chucking mechanisms for said spindle, a series of side and top tool cross slides encircling the rotary spindle, mechanism for operating said cross slides, an indexible tool turret having reciprocating independently operated tool slides, mechanism for reciprocating said slides, and mechanism for indexing the tool turret, all of said operating mechanisms being completely housed by a pair of assembled housings in rear of the cross slides and by a housing spaced from the cross slides and between which last housing and cross slides the indexible tool turret is located.

73. The machine of claim 66 in which the tool turret indexing means is operatively controlled by the locking means and gradually stopped thereby.

84. In an automatic single spindle machine, the combination of a single rotary work spindle, means for rotating it, an indexible tool turret having reciprocating independently operated tool slides, means for reciprocating said slides, means located beyond the outer end of the tool turret for indexing the tool turret, a series of side and top tool slides encircling the rotary spindle, and means for operating said slides, the operating means for the tool turret being located in a housing positioned at the outer end of the tool turret.

90. The machine of claim 66 in which the locking means gradually stops the indexing means.

91. In an automatic single spindle machine, the combination of a single rotary spindle, means for operating the spindle, a cam shaft, a clutch for controlling the speed of said spindle, fluid operative means for controlling the operation of said clutch, and cam shaft controlled valve mechanism for controlling the operation of said fluid means and thereby the operation of said clutch.

92. In an automatic single spindle machine, the combination of a single rotary spindle, means for rotating the spindle, a cam shaft, work holding means carried by the spindle, fluid operative means for controlling the operation of said work holding means, and cam shaft controlled valve mechanism for controlling the operation of said fluid means and thereby the operation of said work holding means.

94. In an automatic single spindle machine, the combination of a single rotary spindle, means for rotating the spindle, a cam shaft, an indexible tool turret, fluid operative means for indexing the turret, and cam shaft controlled valve mechanism for controlling the operation of said fluid means and thereby the indexing of the turret.

95. In an automatic single spindle machine, the combination of a single rotary spindle, means for rotating the spindle, a cam shaft, an indexible tool turret having reciprocating independently operated tool slides, fluid operative means for operating the tool slides, and cam shaft controlled valve mechanism for controlling the operation of said fluid means and thereby the operation of the slides.

96. In an automatic single spindle machine, the combination of a single rotary spindle, means for rotating the spindle, a cam shaft, an indexible tool turret, means for locking said turret, fluid operative means for controlling the operation of said locking means, and cam shaft controlled valve mechanism for controlling the operation of said fluid means and thereby the operation of said locking means.

The references are: Gerry, 332,889, December 22, 1885; Gridley, 725,438, April 14, 1903; Drissner, 1,567,790, December 29, 1925; Drissner, 1,604,116, October 26, 1926; Blood et al., 1,924,594, August 29, 1933; Whipp et al., 2,027,568, January 14, 1936; Spring, 2,053,748, September 8, 1936; Simpson, 2,103,342, December 28, 1937; Curtis, 2,118,021, May 17, 1938; Potter et al., 2,118,024, May 17, 1938.

Appellants' device is a machine for performing various operations, such as boring or cutting on metal bar stock. The machine comprises a hollow rotatable spindle through which the bar stock passes longitudinally. Adjacent one end of the spindle, top and cross slides are mounted which are adapted to move various tools toward and from the stock. Those tools, which approach the bar stock from the side, perform the desired operations on the stock. A turret is provided beyond the end of the spindle for performing operations on the end of the stock. The turret carries four sets of guides along which tools may be moved toward or from the end of the stock as it is held by the spindle. The turret may be rotated to bring any one of the sets of guides into position so that the tool carried thereby may act on the stock.

The stock, in appellants' device, is held in the spindle by a collet or socket which has a bevelled outer surface engaging a correspondingly bevelled surface on an outer sleeve member which surrounds the collet. The collet is attached to a tube, and longitudinal movement of the tube produces a relative movement between the bevelled surfaces of the collet and outer sleeve member, thus causing the collet to contract and grip the stock. The longitudinal movement is effected by a toggle comprising levers, the outer ends of which are received in sockets while their inner ends are connected to a roller, the arrangement being such that the diameter of the roller is almost as great as the space between the sockets when the arms of the toggle are shifted toward each other.

The turret, which supports the tools adapted to engage the end of the stock, may be indexed (i. e., rotated to bring a desired tool opposite the stock) by means of a hydraulic mechanism which is mounted at one end of the machine.

The spindle is driven by a motor through a train of gears including two gears which are mounted on a common shaft and which are alternatively connected to and disconnected from the shaft by means of a clutch. The arrangement is such that the spindle will be driven at one speed when one of the gears is clutched to the shaft and at another speed when the other gear is clutched to it. The clutch is shifted by means of a hydraulically actuated piston and the movement of the piston is controlled by a valve actuated by a cam shaft.

Claim 20 is directed to appellants' toggle arrangement in which one end of each of two toggle arms is joined to a roller and the other ends of the arms are mounted in sockets, the roller being only slightly smaller than the space between the members in which the sockets are formed when the toggle is in closed position.

The Primary Examiner rejected claim 20 on the disclosure in the patent to Gerry and the disclosure in the Drissner Patent No. 1,567,790, stating that the Drissner patent was cited as disclosing the cross slides encircling the spindle, as called for in that claim.

The patentee Gerry discloses a structure in which two toggle arms are pivoted together at one end, but the pivot pin is not a roller and is much smaller than the space between the members to which the opposite ends of the toggle arms are joined, whereas in appellants' structure, as hereinbefore noted, the roller to which the toggle arms are pivoted is almost as large as the space between the members. Furthermore, in the patentee's structure, neither of the toggle arms has its outer end in a socket. Although the function of Gerry's toggle is generally similar to that of appellants, the patentee neither discloses nor suggests the particular arrangement of the toggle and associated elements called for by appealed claim 20. Accordingly, we are of opinion that the structure defined by claim 20 is patentable over the references of record.

Claims 44 and 45 were rejected on the Drissner patent, No. 1,567,790, which discloses a single spindle machine having the same general arrangement of the spindle, gears, cross slides, and tool turret with guides for holding tools to act longitudinally on the stock, as called for by those claims, in view of the disclosures in the patents to Whipp et al., Spring, Simpson, and Potter et al.

Claims 44 and 45 are distinguishable from the Drissner patent only in that they call for housings for various parts of the machine.

The idea of providing housings for mechanisms of various kinds is conventional, as disclosed in each of the patents to Whipp et al., Spring, Simpson, and Potter et al. We are of opinion, therefore, that claims 44 and 45 do not define patentable subject matter.

Claims 73 and 90 have been rejected on allowed claim 66 on which they depend.

Claim 66 defines an apparatus.

Claims 73 and 90 define no structure in addition to that of claim 66, but merely state that the apparatus operates in a particular way.

[1] Apparatus claims must, in order to be patentable, distinguish over the prior art in terms of structure. They cannot be held to be patentable merely on the basis of functional limitations. *In re Carr*, 28 C. C. P. A. (Patents) 1240, 120 F.(2d) 386, 49 USPQ 657, 530 O. G. 747; *In re Schmidt et al.*, 30 C. C. P. A. (Patents) 785, 132 F.(2d) 869, 56 USPQ 317, 549 O. G. 4; *In re Stattmann*, 32 C. C. P. A. (Patents) 813, 146 F.(2d) 290, 64 USPQ 245, 571 O. G. 351. It is clear, therefore, that claims 73 and 90 are not materially different from claim 66, but depend upon exactly the same structure as that claim for patentability. Had claim 73 included the statment that the tool turret indexing means is operatively connected to, and controlled by, the locking means, a different situation would have been presented. We are of opinion, however, that claims 73 and 90, as drawn, do not involve patentable subject matter.

Claims 84, 85, 86, and 87, which call for housings for various parts of appellants' machine, were rejected on the Drissner patent, No. 1,567,790.

[2] As hereinbefore stated in connection with claims 44 and 45, housings for various parts of a machine do not involve patentable subject matter.

In addition to the housings, claims 84, 85, 86, and 87 distinguish from the disclosure in the patent to Drissner in stating that the indexing means for the tool turret is located beyond the outer end of the turret. We have carefully considered the arguments of counsel for appellants with regard to that feature, but are unable to hold that the tribunals of the Patent Office erred in concluding that the location of the indexing means, as defined in those claims, does not involve invention.

Claim 91 was rejected by the tribunals of the Patent Office on the disclosure in the patent to Curtis, in view of the disclosure in the Drissner Patent No. 1,604,116.

The patentee Curtis discloses a single spindle machine having change-speed gearing, including a hydraulically operated clutch. The operation of the patentee's clutch is controlled by a valve which is actuated by a solenoid.

It is argued by counsel for appellants that the Curtis device is not a "single spindle machine as commonly understood for the spindle * * * does not carry stock rods nor are such rods fed therethrough."

We are unable to agree with that contention of counsel. The spindle in the Curtis device is described by the patentee as "a vertical spindle," and holds the work to be operated on. It is, therefore, in our opinion, a spindle within the meaning of that term as used in claim 91, which merely calls for a rotary spindle and does not state that the work passes therethrough. Claim 91 distinguishes from Curtis only in that it calls for a cam shaft, and states that the valve which controls the clutch is "cam shaft controlled." The claim does not specify the location or operating connections of the cam shaft, nor does it state that the cam shaft actuates the valve directly rather than through a solenoid or other intermediate means.

The actuation of various machine parts by cams is conventional, and the Drissner Patent No. 1,604,116 discloses that it is old to control the valves of a metal working machine by means of a cam shaft. In view of the disclosures in the patents to Curtis and Drissner (No. 1,604,116) we are of opinion that claim 91 does not define patentable subject matter.

Claims 92 and 93 are directed to fluid operated means for controlling the feeding and holding of the stock.

Those claims were rejected on the disclosure in the Drissner patent, No. 1,567,790, in view of the disclosure in Drissner's Patent No. 1,604,116, and are readable on the disclosure in the latter patent, except that they call for a single spindle machine, whereas the patent discloses a machine having five spindles. However, the patentee expressly states that his machine may be a "single spindle or multiple spindle screw" machine.

Claims 92 and 93 call for no structure which is peculiar to a single spindle machine. Under the

related circumstances, we hold that those claims do not define patentable subject matter.

Claim 94 is drawn to fluid operated means, controlled by a cam shaft, for indexing the tool turret, and was rejected on the disclosure in the patent to Curtis.

In the Curtis machine, the motor is driven electrically, rather than by fluid pressure, and is controlled by projections or dogs, rather than by cams. However, there is nothing new either in fluid pressure operation of motors, which is disclosed in the patent to Blood et al., or in cam shaft control. Accordingly, those features broadly called for in claim 94 do not define patentable subject matter.

Claim 95 is directed to the fluid pressure operating means of the "tool slides" of the turret, and to the cam shaft control of the operating means.

That claim was rejected on the disclosure in the patent to Curtis and is fully met by that patent, except that in the Curtis machine the fluid pressure devices which actuate the tool slides are not controlled by a cam shaft. As hereinbefore indicated, the broad reference to cam shaft control is not considered sufficient to render the claim patentable which is otherwise fully anticipated by the patent to Curtis.

Claims 96 to 102, inclusive, were rejected on the patent to Drissner (No. 1,567,790) which discloses the arrangement of single spindle, top and cross slides, and cam shaft control, as called for by those claims, in view of the disclosures in the patents to Blood et al. and Curtis.

The only difference between the structures called for by claims 96 to 102, inclusive, and the disclosure in the Drissner patent is that the claims call for fluid operation of various parts of appellants' machine and control thereof from the cam shaft by means of valves, whereas in the patent those parts are mechanically operated and mechanically controlled from the cam shaft.

The Primary Examiner held that the mechanical means of the Drissner patent are fully equivalent to the fluid pressure means as broadly called for in those claims, and that fluid operation of parts corresponding to those recited in those claims was old, as disclosed in the patents to Blood et al. and Curtis. That holding, with which we are in accord, was approved by the Board of Appeals.

It is stated in the brief of counsel for appellants that claim 98 calls for fluid operated means for controlling the speed of operation of the top and cross slides, rather than for controlling their operation, and that, therefore, that claim is patentable over the references of record.

We are unable to agree that control of the speed of operation of the slides, as broadly recited in claim 98, presents a patentable distinction over the control of the operation of the slides as disclosed by the patents to Drissner (No. 1,567,790), Blood et al., and Curtis, upon which the claim was rejected.

For the reasons stated, the decision of the Board of Appeals is modified, being affirmed as to claims 44, 45, 73, 84, 85, 86, 87, and 90 to 102, inclusive, and reversed as to claim 20.

Modified.

GARRETT, *P. J.*, sat during the arguments of this case, but because of illness took no part in its consideration or in the decision.

U. S. Court of Customs and Patent Appeals

IN RE DENSE

No. 5,173. Decided June 11, 1946

[— F.(2d) —; 70 USPQ 212]

1. CLAIMS—INTRODUCTORY STATEMENT.
   "The words 'A floor mat' are merely an introductory statement and can be given no weight in determining the patentability of the claims."
2. SAME—TERMS.
   "In article claims invention must be described in terms of structure and not those of intended use."
3. PATENTABILITY—FLOOR MAT.
   Claims calling for a "floor mat comprising a supporting layer and an outer tacky layer of wax-like material having a tread surface that is tacky, soft, rough, and adhesive," and reciting that the tread surface acts "to remove particles of dirt and dust from the sole of a contacting shoe and to retain the dirt and dust while readily releasing the shoe," *Held* unpatentable over a publication disclosing appellant's specific material as a coating for paper and cloth; and *Held* "that that reference, in its suggested uses of the material which specifically includes 'adhesive compounds,' would teach the use made of it by appellant."
4. APPLICATION—DISCLOSURE.
   "It was contended that it is impossible to define the critical point of thickness 'below which the wax layer is inoperative and above which it operates sucessfully.' This seemingly would be a confession that no one skilled in the art would be able to practice the invention upon the disclosure."
5. CLAIMS—DEFINITENESS.
   "An invention to be patentable must be accurately defined."

APPEAL from the Patent Office. Affirmed.

Mr. Harold E. Stonebraker for Dense.

Mr. W. W. Cochran (*Mr. E. L. Reynolds* of counsel) for the Commissioner of Patents.

JACKSON, *J.:*

The Board of Appeals of the United States Patent Office affirmed a decision of the Primary Examiner rejecting, in view of the prior art, all of the claims, 1 to 5 inclusive, of an application for a patent alleging "new and useful improvements in Floor Mat." The cited references are: Ellis, 1,784,803, December 9, 1930, and Glyco Chemicals, page 27, July 1938. From that decision this appeal was taken.

Claims 1 and 4 are illustrative of the subject matter on appeal and read as follows:

1. A floor mat comprising a supporting layer and an outer tacky layer of wax-like material having a tread surface that is tacky, soft, rough, and adhesive, said tread surface acting to remove particles of dirt and dust from the sole of a contacting shoe and to retain the dirt and dust while readily releasing the shoe.

4. A floor mat comprising a supporting layer and an outer tacky layer of synthetic wax known as "Flexo Wax C-Light" having a tread surface that is tacky, soft, rough, and adhesive, said tread surface acting to remove particles of dirt and dust from the sole of a contacting shoe and to retain the dirt and dust while readily releasing the shoe.

The subject matter of the alleged invention may be readily discerned from the quoted claims.

The Ellis patent relates to floor coverings comprising a supporting web or fabric, preferably of paper or sheets of pulp material, coated with a wax composition which may include paraffin.

The Glyco publication discloses Flexo Wax C, which is specifically the material disclosed by appellant. It is stated in the publication that the wax "in thin layers on paper or cloth" will not flow even at temperatures higher than 65.5° C., is waterproof, non-crystalline, and possesses "high adhesive properties."

The Examiner rejected all of the claims as being substantially met by the Glyco reference, and further as involving no invention over the patent to Ellis in view of the Glyco reference. Claims 4 and 5 were also rejected as being vague and indefinite because of the use of the trade name "Flexo Wax C-Light."

The Board, in affirming the decision of the Examiner, agreed with the reasons for rejection stated by him, but did not consider it necessary to discuss the rejection of the claims on the patent to Ellis in view of the Glyco publication.

It is admitted that the publication discloses paper and cloth as a base for the same coating material as that claimed. Therefore with respect to this rejection, in order to hold the claims patentable we would have to hold that the introductory words "floor mat" or a coated surface which is "tacky, soft, rough, and adhesive," and retains the dust or dirt from the sole of a shoe while readily releasing it, render the claims patentable.

[1][2] We think, contrary to the contention of appellant, that the words "A floor mat" are merely an introductory statement and can be given no weight in determining the patentability of the claims. The fact that it is so designated does not render the article described in the claims necessarily patentable. In article claims invention must be described in terms of structure and not those of intended use. We think this is in accord with the authorities. See *In re Rockwell*, 32 C. C. P. A. (Patents) 1177, 150 F.(2d) 560, 66 USPQ 215, 580 O. G. 158, and cases therein cited.

[3][4][5] It has not been shown that the coating has different properties by reason of its depth. There is nothing in the application suggesting a thickness in the coating, or suggesting that in order to attain the desired result any specific thickness must be used. It seems to us that the softness and tackiness in the waxy substance are inherent in the material rather than in the thickness of the coating, and it has not been explained why there should be a difference. In the Glyco publication nothing is said concerning the thickness of the coating. It is clear, we think, that that reference, in its suggested uses of the material which specifically includes "adhesive compounds," would teach the use made of it by appellant.

During the prosecution of the case in the Patent Office appellant filed an affidavit in which he stated that he had coated a thin layer of base material with Flexo Wax C "in accordance with usual waterproofing practice." He did not, however, mention what the actual thickness was, nor what the "usual practice" is. He concludes that dust will not stick to a thin coating, but does not show why it does adhere to a thick coating.

Both in the brief and oral argument on behalf of appellant, it was contended that it is impossible to define the critical point of thickness "below which the wax layer is inoperative and above which it operates successfully." This seemingly would be a confession that no one skilled in the art would be able to practice the invention upon the disclosure. It is trite to say that an invention to be patentable must be accurately defined. Here we find no such definition.

We are of opinion that the appealed claims define nothing that is not disclosed in the Glyco publication as fully and completely as in the involved application.

For the reasons above stated it is not necessary to consider the other grounds of rejection by the tribunals below.

The decision appealed from is affirmed.

Affirmed.

GARRETT, *P. J.*, sat during the arguments of this case, but because of illness took no part in its consideration or in the decision.

U. S. Court of Customs and Patent Appeals

IN RE SELMI ET AL.

No. 5,160. Decided June 11, 1946

[— F.(2d) —; 70 USPQ 201]

PATENTABILITY—ALLOY STEEL.
Reference made to the decision in companion appeal No. 5,161, and certain claims relating to alloy steels *Held* properly rejected.

APPEAL from the Patent Office. Affirmed.

Mr. Justin W. Macklin (*Mr. James J. Shanley* of counsel) for Selmi et al.

Mr. W. W. Cochran (*Mr. E. L. Reynolds* of counsel) for the Commissioner of Patents.

O'CONNELL, *J.:*

This is an appeal from the decision of the Board of Appeals of the United States Patent Office affirming the action of the Primary Examiner in his rejection of claims 5 to 9, inclusive, and claim 11 in appellants' application for a patent for alleged "new and useful improvements in Alloy Steel." Claim 12 was allowed.

Claims 5 to 9 in appellants' application stand rejected as unpatentable over the disclosures of two prior patents granted to the appellants. Claim 7 was further rejected as functional and claim 8 as containing new matter. Claim 11, copied from the patent to Fleischmann, No. 2,332,441, for the purpose of interference, was rejected as unpatentable over the prior art as well as for lack of sufficient disclosure.

Claims 5 and 11 are illustrative. They read—

5. A low carbon low alloy fine grain steel having high tensile strength and capable of heat treatment and quench hardening, and which may be rolled and normalized and which when carburized is free from massive cementite network, and in which the relation of carbon to silicon increases the elastic limit, and the steel containing an amount of molybdenum having a critical relationship between it and the carbon and silicon content, and the steel containing .30 to .75% manganese, .60 to .90% silicon, .30 to .75% chromium, .10 to .20% zirconium, sulphur and phosphorus not over .05% each the carbon being from .06 to .24% the molybdenum .10 to .20% and the remainder being substantially all iron.

11. Chromium carburizing steel containing as essential alloying elements about 0.5 to about .75 per cent of chromium, about 0.6 to about 0.9 per cent of silicon, about 0.1 to about 0.2 per cent of molybdenum, carbon from 0.1 to about 0.24 per cent and in an amount such that the steel is hardenable by heat treatment, and the remainder iron together with impurities and elements in amounts which do not adversely affect the carburizing and heat treating characteristics of the steel, and characterized by producing, upon being carburized and hardened by heat treatment, a carburized case resistant to spalling and low in or substantially free from massive carbides, and high tensile strength in the core as the result of heat treatment.

The references are—Selmi et al., 2,234,130, March 4, 1941; Selmi et al., 2,250,505, July 29, 1941.

The subject matter of the appealed claims, as well as that of the cited references, relates to alloy steels in specific proportions. The instant case is closely related to the companion appeal, No. 5161, involving the identical parties and concurrently decided by this court.

The distinction between the subject matter of the companion appeal and this one is alleged in appellants' brief to be—

It differs essentially in that it specifically includes molybdenum and is directed to so balancing the ranges of the other elements as to most effectively use the small molybdenum content.

* * * * * * *

In the companion appeal, Docket No. 5161, appellants have set forth in their brief the great advantages and remarkable economies of precious alloys which have been accomplished in these steels, and there the hardenability characteristics, particularly the effective depth of core hardening, was limited to thin sections. Under the critical upper limit and within the extremely narrow limit in the present application, the applicants have so proportioned the other elements that molybdenum may be used to effectively and economically secure core hardening to much greater depth.

* * * * * * *

The briefs differ in that the companion appeal includes claims rejected on different prior art. However, the reasons for patentability are in many respects the same.

The record shows, and the Examiner and Board of Appeals correctly held, that the percentage ranges of all of the elements defined in the appealed claims fall within the ranges disclosed by appellants' prior patents cited herein. We have analyzed the evidence in support of appellants' contention of criticality and agree with the holding of the tribunals of the Patent Office that appellants have failed to sustain their burden of proof with respect to this phase of the case.

Claim 11 has the same status here as claims 13 to 17, inclusive, had in the companion appeal, No. 5161, and, as decided in that case, appellants' failure to recite zirconium in the claim is a valid basis for its rejection.

Other points raised here by appellants, so far as they are essential to the issue involved, were discussed and properly passed upon by the tribunals of the Patent Office, and we find nothing in the record that requires a reversal of the decision of the Board of Appeals.

For the reasons hereinbefore stated, as well as for the reasons stated in the decision of the court in appellants' companion appeal, No. 5161, so far as they relate to the issue in this case, the decision of the Board of Appeals is affirmed.

Affirmed.

GARRETT, *P. J.*, sat during the arguments of this case, but because of illness took no part in its consideration or in the decision.

U. S. Court of Customs and Patent Appeals

IN RE SELMI ET AL.

No. 5,161. Decided June 11, 1946

[— F.(2d) —; 70 USPQ 197]

1. PATENTABILITY—INVENTION—ALLOY STEEL.
   Upon consideration of appellants' claims to an alloy steel, *Held* that the "point or range alleged to be critical must correspond to a physical phenomenon," and that "appellants have the burden of proving that they have invented a new steel having characteristics or qualities of utility that are new and materially different from the steel disclosed by the art of record."
2. SAME—SAME—SAME.
   "The critical difference alleged to exist between the alloy steels claimed by appellants and those of the cited art of record must be established by actual proof."
3. APPLICATION—DISCLOSURE—CLAIMS COPIED FROM PATENT.
   In connection with claims copied by appellants from a patent, *Held* that "appellants' disclosure contains no teaching as to an alloy that does not contain zirconium as an essential ingredient," and that "the disclosure forms no basis * * * for claiming an alloy that does not include zirconium."
4. APPEAL—EVIDENCE CONSIDERED.
   "The paper in question was submitted with appellants' petition to the Board for the reconsideration of its decision. Before action by the Board was taken on the petition, however, appellants filed their appeal and the Board of Appeals transferred jurisdiction of the cause to this court. Accordingly, the data in question is not properly before the court and may not now be considered."
5. SAME—DECISION—AFFIDAVIT—RULES 66 AND 76.
   "If appellants wished to object to the Board's statement and to question the correctness of the facts contained therein, they should have requested the Board to cite its authority for the statement. If the cited authority was based upon facts within the personal knowledge of the Board, appellants should have proceeded under rules 66 and 76 of the Patent Office and called for the affidavit of the Board."
6. SAME—EFFECT OF FAILURE TO CHALLENGE STATEMENTS BELOW.
   Where appellants did not request the Board of Appeals to cite its authority for a statement, *Held* that the statement must be accepted as correct.

APPEAL from the Patent Office. Affirmed.

Mr. Justin W. Macklin (*Mr. James J. Shanley* of counsel) for Selmi et al.

Mr. W. W. Cochran (*Mr. E. L. Reynolds* of counsel) for the Commissioner of Patents.

O'CONNELL, *J.:*

This is an appeal from the decision of the Board of Appeals of the United States Patent Office affirming the action of the Primary Examiner in his rejection of claims 5 to 17, inclusive, and 19 in appellants' application for a patent for alleged "new and useful improvements in Alloy Steel." Claims 18, 20, 21, and 22 were allowed.

Claims 5 to 12, inclusive, were rejected as unpatentable over the prior art; claims 13 to 17, inclusive, copied from the patent to Fleischmann, No. 2,332,441, for the purpose of interference, were rejected for lack of sufficient disclosure; and claims 14 and 19 were "considered unpatentable in the limit imposed upon the amount of carbide-forming elements in the alloy."

The references are—Kinzel, 2,114,802, April 19, 1938; Kinzel, 2,152,434, March 28, 1939.

Claims 5, 13, and 19, which define the involved composition by its properties, its ingredients and the percentages thereof, are illustrative. They read—

5. A fine grained high tensile low allow steel having good welding characteristics and high resistance to strain aging and blue brittleness consisting of carbon .08 to .17%, manganese .50 to .75%, silicon .60 to .90%, chromium .30 to .65%, a maximum of .05% phosphorus, a maximum of .05% sulphur, .06 to .15% zirconium, the balance being substantially all iron and incidental impurities.

13. A case carburized steel article formed from chromium carburizing steel containing as essential alloying elements, 0.1 to about 0.3 per cent of carbon, from about 0.5 to about 0.75 per cent of chromium, about 0.6 to about 0.9 per cent of silicon, and substantially no nickel, and the remainder iron together with impurities and elements in amounts which do not adversely affect the carburizing characteristics of the steel, and characterized by the carburized and hardened case being resistant to spalling and low in or substantially free from massive carbides.

19. A case carburized steel article formed from chromium carburizing steel containing as essential alloying elements from about 0.1 to about 0.3 per cent of carbon, at least one carbide-forming element including at least about 0.5 per cent of chromium, the sum of said carbide-forming elements aggregating up to 2.55 per cent and about 0.6 to about 0.9 per cent of silicon, and .06 to .20 per cent of zirconium, and the remainder iron together with impurities and elements in amounts which do not adversely affect the carburizing characteristics of the steel, and characterized by its carburized and hardened case being resistant to spalling, and low in or substantially free from massive carbides.

The invention relates to a low alloy steel. The appealed claims describe the composition and as explained in the "authorized" literature submitted by appellants, "It is designed chemically to give the maximum benefits to be derived from alloying elements while holding to a minimum the undesirable features which accompany some of these elements when used in a steel designed primarily for structural purposes."

Except for their claims, the patents to Kinzel are substantially identical. It is not disputed that they disclose wider ranges of the elements also disclosed by appellants. Appellants contend, however, that the patents to Kinzel are for a different kind of steel and that appellants' ranges are narrower than Kinzel and teach "new balances and controls for new results."

Although the patents to Kinzel disclose a composition designed for case hardening by nitrification, while appellants' composition is particularly designed for case hardening by a carburizing compound, appellants' contention that the patents may not be considered as appropriate references is without merit.

Appellants' claims limited to "A case carburized steel article formed from chromium carburizing steel * * * and characterized by the carburized and hardened case being resistant to spalling and low in or substantially free from massive carbides" have been allowed. One of such claims, No. 21, is limited to "A nickel-free carburized steel article" and in claim 20, "A chromium-containing carburized steel article" is further characterized by "high tensile strength in the core as the result of heat treatment."

Moreover, the record shows that the claims rejected as lacking invention over the art of record, are claims that are not definitely limited in substance to the carburizing feature in the treatment of the steel, nor to an article of carburized steel, but to the alloy per se. The distinction between an article of steel treated by nitrification and one treated by a carburizing compound is accordingly eliminated insofar as such claims are concerned. It is our opinion therefore that the disclosures of the cited references are applicable to the case at bar.

In addition to the 85% or more of iron disclosed in his composition, the alloying elements described and claimed by Kinzel include specific and essential proportions of chromium, manganese, silicon, and zirconium. Furthermore, "other nonessential elements may be present." Kinzel also discloses that "The presence of some carbon is commercially unavoidable" and "is usually present in amounts of about 0.10% to 0.3%." The ranges of elements defined in the rejected claims as hereinbefore noted are all included in substantial proportions within the foregoing ranges disclosed by Kinzel. The question presented here is whether appellants' selected ranges differ from the ranges of the art of record so as to effect an unexpected result.

[1] The point or range alleged to be critical must correspond to a physical phenomenon and on that basis appellants have the burden of proving that they have invented a new steel having characteristics or qualities of utility that are new and materially different from the steel disclosed by the art of record. See *Dow Chemical Co.* v. *Halliburton Oil Well Cementing Co.*, 324 U. S. 320, 329, 573 O. G. 165; *In re Gillett*, 30 C. C. P. A. (Patents) 900, 133 F.(2d) 910, 56 USPQ 530, 552 O. G. 7.

Appellants contend that they teach new balances and controls for new results over Kinzel. That point was aggressively and earnestly argued and reargued in detail during the prosecution of appellants' application in the tribunals of the Patent Office. Affidavits and advertising material, "authorized for what it said," were submitted by appellants in support of their position following an early rejection by the Examiner on the ground that "Applicant has failed to demonstrate that the steels defined by the claims at bar possess any qualities not also possessed by the Kinzel steels."

[2] The critical difference alleged to exist between the alloy steels claimed by appellants and those of the cited art of record must be established by actual proof. The rule applicable here was stated as follows by this court in the case of *In re*

Swenson et al., 30 C. C. P. A. (Patents) 809, 132 F.(2d) 1020, 56 USPQ 372, 549 O. G. 200:

> • • • It was held by the tribunals below that there is nothing in the specification to show that the claimed ratios are critical. While it appears in the application that the ranges claimed constitute "a very novel feature of our invention" such statement does not amount to a showing that the ranges existing in the specific ratios of those claims are critical. The mere statement by the appellants that such statement is a measure of critical limitations in the absence of any further statement in the specification or actual showing of reasons why they should be considered as such cannot be accepted as proof that such ratios are in fact critical. *In re Creider et al.*, 29 C. C. P. A. (Patents) 1079, 129 F.(2d) 568. • • •

We have examined appellants' specification as well as the affidavits and the advertising material submitted in the record and find nothing therein that establishes appellants' contention in regard to criticality.

It is elemental, and the authorities hereinbefore cited are to the effect, that a mere difference in proportion of the constituents of a composition, even though a better result may be attained, does not entitle an applicant to a patent where the result differs from those of the prior art only in a matter of degree. While it is urged by appellants that the proportions stated are critical, it appears otherwise from the record, and the Board of Appeals correctly held that the claims in question defined no composition patentable over Kinzel.

Claims 13 to 17, inclusive, presented for the express purpose of provoking an interference with Fleischmann, were rejected for lack of sufficient disclosure in claiming an alloy which does not include zirconium. The patent to Fleischmann issued on an application that was copending with appellants' present application, and appellants urge that the two applications disclosed substantially the same subject matter. The record shows and it is not disputed that Fleischmann does not specifically recite zirconium as an essential ingredient. Appellants contend, however, that their "disclosure is a proper basis for claiming an alloy steel without naming zirconium."

The Board of Appeals in affirming the decision of the Examiner stated:

> The rejection here is based on the proposition that the present application contains no basis for claims not reciting zirconium because the entire specification and original claims are concerned with steels in which zirconium is an essential ingredient and appellants did not contemplate its omission or even hint that it might be omitted.

Appellants' original claims, as hereinbefore noted, were limited to alloys including zirconium. In describing their invention appellants stated:

> • • • Basically it is a low alloy steel, attaining high qualities and in which valuable alloying elements, and particularly those of present strategic importance, such as silicon, chromium and zirconium, are held to a minimum.
>
> • • • • • • •
>
> The steel in addition to iron, contains the following elements intended in practice to be within the ranges specified: • • • % Zirconium .06–.20 • • •.

Among the remarks submitted in support of various amendments, appellants further stated:

> For a time the supply of zirconium raised a serious question because sand constituting a large source used in producing ferro-silicon zirconium was shipped from India. • • •
>
> • • • • • • •
>
> The zirconium limit of one half of the .30% suggested by Kinzel is necessary because weldability may be adversely affected with certain equipment causing reaction pitting and general difficulty in steel making. On the other hand the minimum is given to insure the fine grain or high grain coarsening temperature disclosed and claimed and to contribute to freedom from strain aging.

In appellants' affidavit to prove criticality, they pointed out also that Kinzel "recommends from .1 to .3 zirconium," while "In the applicants' narrower ranges much smaller amounts of zirconium may be used."

[3] The reasonable inference to be drawn from the facts hereinbefore related is that appellants' disclosure contains no teaching as to an alloy that does not contain zirconium as an essential ingredient. Therefore the disclosure forms no basis, as correctly decided by the Examiner and the Board of Appeals, for claiming an alloy that does not include zirconium.

Claims 14 and 19 are also copied in part from the patent to Fleischmann. In their reasons of appeal, appellants contend that—

> 5. The Board of Appeals erred in holding claims 14 and 19 lack identity with the original disclosure; and in holding them unpatentable in the limit imposed upon the amount of carbide forming elements in the alloy; and in affirming the Examiner in his position that there is no basis for such limitations in the application as filed.

The two claims under consideration are limited to "at least one carbide-forming element including at least about 0.5 per cent of chromium, the sum of said carbide-forming elements being not over about 3.75 per cent, and about 0.6 to about 0.9 per cent of silicon," in claim 14; and "aggregating up to 2.55 per cent and about 0.6 to about 0.9 per cent of silicon, and .06 to .20 per cent of zirconium," in claim 19.

The Board of Appeals in its rejection of claims 14 and 19 stated that "No carbide-forming element other than chromium is found in the specification as filed." On that point, appellants contend that "the Board expresses a clear mistake of fact." In support of their position, appellants submit here a sheet containing certain data "copied from page 38 of the U. S. S. Carilloy Steels booklet." That sheet does not appear to have been introduced in evidence nor to have been considered by the Board.

[4] The paper in question was submitted with appellants' petition to the Board for the reconsideration of its decision. Before action by the Board was taken on the petition, however, appellants filed their appeal and the Board of Appeals transferred jurisdiction of the cause to this court. Accordingly, the data in question is not properly before the court and may not now be considered.

[5] Moreover, if appellants wished to object to the Board's statement and to question the correctness of the facts contained therein, they should have requested the Board to cite its authority for the statement. If the cited authority was based upon facts within the personal knowledge of the Board, appellants should have proceeded under rules 66 and 76 of the Patent Office and called for the affidavit of the Board. Appellants would then have been in a position to contradict or explain the Board's statement.

[6] No such request was made by appellants, however, and they may not be heard to contend here that a carbide-forming element other than chromium is found in the specification as filed. The statement of the Board must be accepted therefore as correct. *In re Lewis*, 25 C. C. P. A. (Patents) 1273, 96 F.(2d) 1009, 37 USPQ 786, 788, 497 O. G. 18.

It is noted, moreover, that claim 14 fixes the upper limit of the carbide-forming elements as aggregating up to 3.75 per cent and claim 19 at 2.55 per cent. Silicon is recited in the claims as distinct from and in addition to the carbide-forming elements and therefore it cannot be included as one of them. As correctly noted by the Examiner, "Appellants argue that the per cent limit given is the sum of these elements given in the specification, but they do not point out how they compute the percentage or where the limitation may be found." It is our opinion therefore that the claims in question were properly rejected.

Appellants devote a great portion of their argument here to the alleged error of the Board in failing to hold that an interference should be declared between their present application and the patent to Fleischmann and that in this proceeding the court should direct that such an interference be declared.

However, since the claims copied from the patent do not read on appellants' disclosure, the failure of the tribunals of the Patent Office to declare an interference cannot be remedied in this proceeding, even if the patent to Fleischmann were issued through inadvertence over the disclosures of Kinzel as stated by the Examiner. See *In re Albert C. Fischer*, 18 C. C. P. A. (Patents) 1076, 47 F.(2d) 794, 8 USPQ 481, 409 O. G. 563.

In view of our conclusion no useful purpose would be served in stating and deciding additional points presented in the argument of appellants, and the decision of the Board of Appeals is accordingly affirmed.

Affirmed.

GARRETT, *P. J.*, sat during the arguments of this case, but because of illness took no part in its consideration or in the decision.

U. S. Court of Customs and Patent Appeals

IN RE SCHERL

No. 5,163. Decided June 11, 1946

[— F.(2d) —; 70 USPQ 204]

1. PATENTABILITY—CRITICALITY.
   "Where the issue of criticality is involved, the applicant has the burden of establishing his position by a proper showing of the facts upon which he relies."
2. APPEAL—AFFIDAVIT.
   "The second affidavit upon which appellant relies was submitted by appellant after the Board rendered its decision. Since the Board did not remand the case to the Primary Examiner under the provision of rule 138 of the Rules of Practice in the United States Patent Office, the affidavit is not properly before this court and may not be considered here."
3. PATENTABILITY—PRESSURE WELDING.
   "Appellant in the adoption of his process for welding joints has done the thing that the art of record clearly suggests doing, and therefore no invention is defined by the appealed claims."

APPEAL from the Patent Office. Affirmed.

Mr. Charles C. Scheffler and *Mr. Eugene L. Greenewald* (*Mr. Charles E. Howson* and *Mr. Donald C. Harrison* of counsel) for Scherl.

Mr. W. W. Cochran (*Mr. E. L. Reynolds* of counsel) for the Commissioner of Patents.

O'CONNELL, *J.*:

This is an appeal from the decision of the Board of Appeals of the United States Patent Office affirming the action of the Primary Examiner in his rejection of claims 1, 3, 6, 10, 13, and 15 in appellant's application for a patent for alleged "new and useful improvements in Pressure Welding Process." The claims were rejected not only as lacking invention over the prior art but also on the ground of multiplicity.

No claims were allowed and appellant petitioned the Board of Appeals for the reconsideration of its decision. The Board heard and considered the petition but denied it with respect to making any change in the decision as rendered.

The references are—Lytle et al., 2,231,014, February 11, 1941; Renner, Jr., 2,231,027, February 11, 1941; Anderson, 2,277,473, March 24, 1942.

Claim 13 is considered illustrative. It reads—

> 13. Process for butt-welding members of weldable metal, each having a margin provided with a beveled portion and with an unbeveled, low forwardly-extending shoulder extending beyond an adjacent margin of said beveled portion; which comprises placing said unbeveled shoulders of the respective members in abutting relation and surface-to-surface contact, whereby each beveled portion cooperates with the beveled portion of the other of said members to form a welding groove having tapered end margins defining an included angle of at least 120°, the metal thickness of the respective members at the abutting surfaces being at least approximately three-fourths the overall metal thickness of said members; pressing said members together while thus abutted; while said surfaces are so pressed together in abutting relation, heating the metal of said abutting surfaces and of that portion of said members lying subjacent said groove to a welding temperature substantially no higher than the solidus temperature of the metal; and restricting the resultant outward flow of upset metal to a zone lying within the confines of the beveled portions of said members.

The alleged invention is described by appellant as a process for pressure welding metal members, such as flat plates, pipes, beams, and bars, wherein the abutting surfaces of the members to be welded are softened by heat and forced together under high pressure.

A portion or portions of the surfaces to be abutted are beveled in such manner as to define a V-shaped groove when the members to be welded are placed in abutting relation. The groove, "which may have an included angle of around 120° to around 150°, and extending longitudinally" of the interface formed by the members in abutting relation, is utilized to avoid or restrict the flow of upset metal beyond the outer surfaces of the members during the welding operation.

Where two opposite sides of each member are beveled, the thickness of the unbeveled portions

should be not less than about one-half of the maximum thickness of either member when unbeveled, or about three-fourths where but one side of each member is beveled.

The patents to Lytle et al. and Renner, Jr. disclose processes, of the type employed by appellant, for butt welding unbeveled metal members, while the patent to Anderson teaches a surface fusion welding of metal members involving the use of surfaces beveled to provide included angles of 90% or less.

Appellant alleges that the resultant joints produced by the processes defined in the cited references invariably had massive ridges of upset metal protruding at the joint as welded and that the removal of such upset metal necessitated an additional operation, costly in time, labor, apparatus, and material and often conducted under disadvantageous conditions in the field.

Appellant contends that the combination of features defined by the appealed claims substitutes a new teaching for the teachings of the cited art and produces a new, useful, and unexpected result differing in kind from the resultant joints produced by the processes of the art of record. Appellant relies upon the proposition that the resultant joint produced by his process is approximately free from upset material extending laterally beyond the normal surface level of the members as welded "and the problem of removing surplus upset metal has been greatly simplified or eliminated."

Appellant takes the further position that in comparison with the prior art, his process provides welded joints that are more satisfactory in strength, ductility and other physical properties.

In using included angles of around 120° to around 150° in the formation of the V-shaped groove, which is filled up by the surplus metal during welding, appellant contends he has secured a critical result, and that statements and examples in his specification, as well as affidavits submitted by him in the prosecution of his application before the tribunals of the Patent Office, provide actual proof of invention as defined by the claims on appeal.

The Solicitor for the Patent Office argues here that—

> The basic grounds of rejection of the claims on the merits are first that it is old in fusion welding to bevel the edges of parts to be welded to form a V-shaped groove which is filled up during the welding, this being conceded in appellant's brief • • •, and shown by the Anderson patent; secondly, that it would require no invention to employ such grooves in pressure welding of the kind shown by Lytle et al. and Renner, where the weld is formed by heat and pressure without actual melting; and, thirdly, that the exact angle of the sides of the groove is a matter of choice or experimental determination and that the use of an angle of 120° or more would involve no invention.
>
> • • • • • • •
>
> Moreover, regardless of admissions, it is obvious that the broad idea of using beveling in pressure welding is not patentable. Fusion and pressure welding shade into each other so that it is difficult to say exactly where one ends and the other begins. • • •

[1] Where the issue of criticality is involved, the applicant has the burden of establishing his position by a proper showing of the facts upon which he relies. *In re Swenson et al.*, 30 C. C. P. A. (Patents) 809, 813, 132 F.(2d) 1020, 56 USPQ 372, 549 O. G. 200.

Appellant does not claim the use of grooves in pressure welding, per se, as a patentable concept but relies upon the use of the particular angle made by the sides of his groove as constituting a critical difference which is inventive over the disclosure of the cited references. The question as to this point is whether he has sustained his burden of proof.

The angle used by Anderson is shown and admitted to be as much as 90° and the angle used by appellant is at least 120°. A difference of but thirty degrees in the respective angles, in the absence of proof to the contrary, is one of degree only.

Appellant's specification does not state that a particular range is critical but describes a groove that "may have an included angle of around 120° to around 150°." Obviously, it cannot be said that such a description is a clear disclosure that the use of an angle of at least 120° is critical. The terms "may have" and "around" do not definitely indicate the use only of an angle of 120° or suggest that an angle, say, of 90° would not be suitable to accomplish the desired result. Other statements made in the specification together with examples cited therein are likewise clearly insufficient from the standpoint of factual evidence to establish a showing of critical superiority.

Of the two affidavits submitted by appellant in support of his position on the issue of criticality, the first alleges that the resultant joints produced by processes old in the art do not have satisfactory strength, ductility and other desired physical properties. No actual figures are submitted by appellant, however, which establish this conclusion.

Moreover, in the comparative tests described in the affidavit, the resultant joints were produced by grooves of 90° and 134°. An angle of 120° was not employed, and the angle of 134° is not a limitation defined in any of the appealed claims. The resultant joints actually welded in the tests were not produced, but the difference between them, as shown by the figures in the illustration submitted, is clearly one of degree only.

[2] The second affidavit upon which appellant relies was submitted by appellant after the Board rendered its decision. Since the Board did not remand the case to the Primary Examiner under the provision of rule 138 of the Rules of Practice in the United States Patent Office, the affidavit is not properly before this court and may not be considered here. *In re Christmann et al.*, 29 C. C. P. A. (Patents) 1037, 128 F.(2d) 596, 53 USPQ 634, 543 O. G. 3.

In the claims on appeal, the limitation which defines an exact amount of the metal thickness of portions of the respective members at the abutting surfaces cannot be held to involve an inventive concept. As correctly pointed out in the brief of the Solicitor—

> • • • There is clearly nothing to show that "at least one-half" or "at least three quarters" is in any way critical in this connection. Whether one face is beveled or two is also merely a matter of choice, both arrangements being old in fusion welding.

The following statement in claim 3 is relied upon by appellant as defining a patentable feature of his disclosure—

> • • • and maintaining an approximately constant unit pressure upon the abutting surfaces as the area of such interface increases during the welding step.

We are unable to agree with appellant's argument on the point in question. If appellant's concept does not involve the use of this obvious expedient, Lytle et al. shows that it is old to maintain a predetermined pressure of a specified number of pounds per square inch during the welding process. "Naturally, if it were desired to keep a reasonably uniform pressure on a joint of varying area," as correctly stated in the Solicitor's brief, "the total pressure could be so regulated as to effect this result."

[3] It is our opinion that appellant in the adoption of his process for welding joints has done the thing that the art of record clearly suggests doing, and therefore no invention is defined by the appealed claims. See *In re Stover* 32 C. C. P. A. (Patents) 823, 146 F.(2d) 299, 64 USPQ 186, 573 O. G. 367.

In view of our conclusion, we deem it unnecessary to discuss the question of multiplicity or other points raised and argued by appellant, and the decision of the Board of Appeals is accordingly affirmed.

Affirmed.

GARRETT, *P. J.*, sat during the arguments of this case, but because of illness took no part in its consideration or in the decision.

Public Law 517—79th Congress

[CHAPTER 587—2D SESSION]

[H. R. 3424]

AN ACT

To permit renewal of certain trade-mark registrations after expiry thereof, and for other purposes.

Be it enacted by the Senate and House of Representatives of the United States of America in Congress assembled, That whenever the President shall find that foreign proprietors of trade-marks registered in the United States Patent Office who are nationals of countries which accord substantially equal treatment in this respect to trade-mark proprietors who are citizens of the United States are or may have been temporarily unable to comply with the conditions and formalities prescribed with respect to renewal of such registrations by section 12 of an act to authorize the registration of trade-marks used in commerce with foreign nations or among the several States or with Indian tribes, and to protect the same, approved February 20, 1905, as amended (15 U. S. C. 92), because of the disruption or suspension of facilities essential for such compliance because of conditions growing out of World War II, he may by proclamation grant such extension of time as he may deem appropriate for the fulfillment of such conditions or formalities by such foreign proprietors: *Provided*, That the President may at any time terminate any proclamation authorized herein or any part thereof or suspend or extend its operation for such period or periods of time as in his judgment the interests of the United States may require: *Provided further*, That no such extension of time shall permit the filing of applications more than three years after the approval of this act: *And provided further*, That the benefits of this act shall not extend to nationals of any enemy country with which the United States was at war in World War II.

Approved July 17, 1946.

Public Law 690—79th Congress

[CHAPTER 910—2D SESSION]

[H. R. 5223]

AN ACT

To extend temporarily the time for filing applications for patents, for taking action in the United States Patent Office with respect thereto, for preventing proof of acts abroad with respect to the making of an invention, and for other purposes.

Be it enacted by the Senate and House of Representatives of the United States of America in Congress assembled, That the rights of priority provided by section 4887 of the Revised Statutes (U. S. C., title 35, sec. 32), as amended, for the filing of applications for patent for inventions, discoveries, and designs, which rights had not expired on the 8th day of September 1939, or which rights have arisen since the 8th day of September 1939, shall be, and the same are hereby, extended until the expiration of a period of twelve months from the passage of this act in favor of the citizens of the United States and of citizens or subjects of all countries which have extended, or which now extend or which within said period of twelve months shall extend substantially reciprocal privileges to citizens of the United States, and such extension shall apply to applications upon which patents have been granted, as well as to applications now pending or filed within the period specified herein: *Provided*, That no such extension shall apply to any patent unless a request in writing was made therefor during the pendency of the application for such patent in the United States Patent Office, or within twelve months after the passage of this act, which request must be accompanied by (1) a copy of the original foreign application, certified to by the patent office of the country in which it was filed, but if the original foreign application has been destroyed, other evidence pertaining thereto may be accepted; (2) a sworn translation of the same if it is not in the English language; and (3) if the foreign application was not made by the inventor himself, an affidavit by the applicant or patentee stating that such application was filed for his benefit or on his behalf and that such procedure is in accordance with the procedure in the foreign country: *Provided further*, That no patent granted or validated by reason of any such extension shall in any way furnish a basis of claim against the Government of the United States: *Provided further*, That such extension shall in no way abridge or otherwise affect the right of the United States, or of any person, firm, association, company, or corporation, who, before the passage of this act was bona fide in possession of any rights in or under patents or applications for patents conflicting with rights in patents granted or validated by reason of such extensions to exercise such rights by itself or himself personally, or by such agents, or licensees as derived their rights from it or him before the passage of this act, to the extent that they shall not be amenable to any action for infringement of any patent granted or validated by reason of such extension.

A patent shall not be refused on an application coming within the provisions of this section, nor shall a patent granted on such application be held invalid, by reason of the invention having been patented or described in any printed publication or in public use or on sale in the United States more than one year prior to the filing of the application in the United States, unless such patent or publication or such public use or sale was prior to the filing of the foreign application upon which the right of priority is based.

SEC. 2. Whenever, prior to the 8th day of April 1946, an invention, discovery, or a design has been communicated in writing or embodied in any article supplied to the Government of the United States or to any person, firm, or corporation in the United States at the request of said Government, pursuant to and by reason of an agreement or arrangement between the Government of the United States and the government of a foreign country for the supply or mutual exchange of information or articles for use for national defense purposes during the periods of the national emergencies declared by the President of the United States preceding World War II, or for use for war purposes during World War II—

(*a*) A patent based on an application filed by the inventor of the invention, discovery, or design so communicated or supplied shall not be refused or held invalid merely because of the fact that the invention, discovery, or design had been in public use or on sale in the United States, or described in a printed publication, if such public use or sale or publication was in consequence of and attributable to the communication or supply and subsequent to the date of the communication or supply; and

(*b*) For use in any action in a United States court or proceeding in the Patent Office involving a patent for an invention, discovery, or a design, or involving an application for patent for an invention, discovery, or a design so communicated or supplied any court of the United States for any district or Territory thereof, and the Commissioner of Patents shall have the power to call upon any department or agency of the Government of the United States to produce information or papers in its possession relating to the communication or supply or relating to the further communication of the invention, discovery, or design by said department or agency to any person, firm, or corporation in the United States: *Provided, however*, That the head of any department or agency may refuse and omit to comply with any call for information or papers when in his opinion such compliance would jeopardize the national defense.

No benefit under section 2 of this act shall be extended to any person unless (1) an application for patent for the same invention, discovery, or design which was communicated or supplied as aforesaid is filed in the United States Patent Office prior to the expiration of twelve months from the date of this act; and (2) unless sufficient information in writing and under oath as to what was communicated or supplied, the date thereof and to whom made, is furnished to the Commissioner of Patents by the owner of such application while it is pending, or prior to the expiration of twelve months from the date of this act to enable him to judge of the identity of the invention so communicated or supplied with the invention claimed in such application, which information shall be made a part of the record of such application and shall have no evidentiary value as proof of the facts stated therein; and (3) unless the country of which such person is a national extends substantially reciprocal privileges to citizens of the United States.

SEC. 3. That whenever it shall be shown to the satisfaction of the Commissioner of Patents that the time now fixed by law for the payment of any fee, or for the taking of any other action, with respect to an application for patent for an invention, discovery, or design has lapsed because of conditions growing out of World War II, which time had not expired on the 8th day of September 1939, or which commenced after the 8th day of September 1939, such time may be extended by the Commissioner to a date not later than twelve months after the passage of this act, without the payment of extension fees or other penalty, in favor of citizens of the United States and the citizens or subjects of countries which have extended, now extend, or shall extend prior to the expiration of twelve months after the passage of this act substantially reciprocal privileges to citizens of the United States: *Provided*, That no extension herein shall confer such privileges upon the citizens or subjects of a foreign country for a longer term than the term during which such privileges are conferred by such foreign country upon the citizens of the United States, but nothing in this act shall give any right to reopen interference proceedings where final hearing before the Examiner of Interferences or the Board of Interference Examiners has taken place.

SEC. 4. That no patent granted or validated by reason of any extension of time provided for by sections 1 and 3 of this act shall abridge or otherwise affect the right of the United States, or of any person, firm, association, company, or corporation, or agent or agents, or his successor in business, to continue or to resume any manufacture, use, or sale bona fide commenced by it or him in the United States before the passage of this act, or, in the case of an application claiming the benefits of section 3 hereof, commenced by it or him before the taking of action or the payment of any fee under that section if such action or payment was later than the passage of this act, nor shall the further manufacture, use, or sale by it or him, or its or his agents or successors in business or the use or sale of the devices resulting from such manufacture or use constitute an infringement: *Provided*, That the benefits of this section shall not apply to the manufacture, use, or sale as aforesaid if and to the extent that it is based upon or attributable to a communication of the invention, discovery, or design so manufactured, used, or sold to the United States or to any person, firm, or corporation in the United States at the request of said Government under an agreement or arrangement between the Government of the United States and the government of another country for the supply or mutual exchange of information or articles for use for national defense purposes during the periods of the national emergencies declared by the President of the United States preceding World War II, or for use for war purposes during World War II.

SEC. 5. Notwithstanding the provisions of sections 4885 and 4887 of the Revised Statutes (U. S. C., title 35, secs. 41 and 32, respectively) no patent issued subsequent to July 17, 1945, which was scheduled for issue on that date, or on July 24, July 31, or August 7, 1945, shall be held invalid because of the deferment of the issuance of such patent due to the failure to issue patents on July 17 and July 24, 1945.

SEC. 6. Notwithstanding the provisions of the Act of Congress approved July 1, 1940 (54 Stat. 710; U. S. C., title 35, sec. 42), as amended by the act approved August 21, 1941 (55 Stat. 657; U. S. C., title 35, secs. 42*a*–42*f*), and as further amended by the act of June 16, 1942 (56 Stat. 370), no person shall be debarred from receiving a patent for an invention made in the United States, nor shall any patent issued for such invention be deemed or held invalid under said act, merely because authorization to file an application for patent for such invention in any country foreign to the United States was not first obtained from the Commissioner of Patents: *Provided*, That the Commissioner subsequently authorized the filing of the application in such foreign country.

SEC. 7. That all applications for patents for inventions, discoveries, or designs officially accepted by the Patent Office and given a serial number and date of filing since the 8th day of September 1939, and prior to the passage of this act, which were executed by an agent of the applicant, and in which a duplicate copy of the specification and a new petition and oath, all duly signed and executed by the inventor or his executor or administrator has been or shall have been filed within a period of twelve months from the approval of this act, and the patents granted on such applications, shall have the same force and effect as if the papers signed and executed by the inventor, or his executor or administrator, had been filed on the date on which the papers signed by his agent were deposited in the United States Patent Office.

SEC. 8. That all applications for patents for inventions, discoveries, or designs filed since the 8th day of September 1939, in which the oath was executed before or authenticated by a consular officer, or other representative qualified to administer oaths, of a government acting in the interest of the Government of the United States, shall have the same force and effect as if said oath had been executed by the applicant before a consular officer of the United States.

SEC. 9. That in proceedings in the Patent Office and in the courts of the United States an applicant for a patent for an invention, discovery, or a design, or a patentee, shall not be permitted to establish the date of invention or discovery by reference to knowledge or use thereof, or other activity with respect thereto, in a country foreign to the United States, other than the filing in a foreign country of an application for a patent for the same invention, discovery, or design which, in accordance with the provisions of section 4887 of the Revised Statutes, as amended, or in accordance with and subject to the provisions of this act, is entitled to have the same force and effect as it would have had if filed in the United States on the date on which it was filed in such foreign country: *Provided*, That where an invention was made by a person, civil or military, during the time such person was domiciled in the United States or its possessions and was serving in a foreign country in connection with the prosecution of the war on behalf of the United States or its allies, the inventor thereof shall be entitled, in interference and other proceedings arising in connection with such invention, to the same rights of priority with respect to such invention as if the same had been made in the United States.

SEC. 10. No patent for an invention or a discovery granted under the provisions of section 1 or 3 of this act shall extend for a longer term than twenty years from the filing date of the first application regularly filed in any country disclosing the same invention, and in no event for a period in excess of seventeen years from the date of the grant of such patent.

SEC. 11. No claims for patent infringement shall be made or action brought by or on behalf of or for the benefit of any country or a national of any country against which the United States has declared the existence of a state of war, in respect to any manufacture, use, or sale since September 8, 1939.

SEC. 12. That nothing in this act shall affect any act which has been or shall be done by virtue of the special measures taken during World War II under legislative, executive, or administrative authority of the United States in regard to the rights of any enemy, or ally of an enemy, as defined by the Trading With the Enemy Act of October 6, 1917 (40 Stat. L. 411), as amended, in patents for inventions and designs.

SEC. 13. Section 10 (*a*) of the said Trading With the Enemy Act, relating to the filing and prosecution of applications for patents and the registration of trade-marks, prints, labels, and copyrights, by an enemy, or ally of an enemy, is hereby repealed.

SEC. 14. The benefits of this act shall not extend in favor of inventions, applications, or patents made by or owned by citizens of any country with which the United States shall have been at war since the 8th day of September 1939. The Alien Property Custodian shall be entitled to the benefits of this act.

SEC. 15. Nothing contained in this act shall be effective to nullify any judicial finding upon the validity of any patent for an invention, discovery, or a design heretofore made by a court of competent jurisdiction.

SEC. 16. If any clause, sentence, paragraph, or part of this act shall be adjudged by any court of competent jurisdiction to be invalid, such judgment shall not affect, impair, or invalidate the remainder thereof, but shall be confined in its operations to the clause, sentence, paragraph, or part thereof directly involved in the controversy in which such judgment shall have been rendered.

Approved August 8, 1946.

Order No. 4094

APPLICATIONS EXECUTED AND FILED BY AGENTS

[Supplement to Order 3662, October 13, 1942]

U. S. PATENT OFFICE, *Washington 25, D. C., Sept. 9, 1946.*

1. *Legislation enacted.* Section 7 of Public Law 690, approved August 8, 1946, provides for the validation under certain conditions of agent executed applications accepted by the Patent Office under Order 3662. The section reads as follows:

"All applications for patents for inventions, discoveries, or designs officially accepted by the Patent Office and given a serial number and date of filing since the 8th day of September 1939, and prior to the passage of this act, which were executed by an agent of the applicant, and in which a duplicate copy of the specification and a new petition and oath, all duly signed and executed by the inventor or his executor or administrator has been or shall have been filed within a period of twelve months from the approval of this act, and the patents granted on such applications, shall have the same force and effect as if the papers signed and executed by the inventor, or his executor or administrator, had been filed on the date on which the papers signed by his agent were deposited in the United States Patent Office."

2. *Partial expiration of Order 3662.* Under the terms of the act only applications accepted by the Patent Office prior to August 8, 1946, can be validated. Hence agent executed applications filed on and after August 8, 1946, cannot be accepted. The first two paragraphs of Order 3662 are no longer in force insofar as concerned new agent executed applications is concerned.

3. *Inventions of citizens of enemy countries.* Section 14 of the act excludes inventions or applications made by or owned by citizens of enemy countries from any of the benefits of the act. Consequently, agent executed applications in which the inventor is a citizen of an enemy country cannot be validated, but this prohibition does not apply to applications vested by the Alien Property Custodian. All pending agent executed applications which cannot be validated (that is, applications in which the inventors are citizens of enemy countries and which have not been vested by the Alien Property Custodian) should be taken up immediately and a notice of abandonment mailed (see also paragraph 7 of this order). The application is then to be sent to the abandoned files the next time abandoned files are pulled. If the application is up for action by the Examiner, action on the merits should not be given.

4. *Suspended applications.* All agent executed applications which were otherwise in condition for allowance and in which action by the Office was suspended in accordance with the fourth paragraph of Order 3662 should be taken up and the following disposition made:

(*a*) If the application cannot be validated, it is to be treated as in paragraph 3 of this order.

(*b*) If properly signed and executed papers have been filed, a notice is to be written indicating that the applicant is entitled to the first filing date, and the case passed to issue or other appropriate action taken. Filing of the duplicate copy of the specification with the new petition and oath will constitute the ratification specified in the last paragraph of Order 3662.

(c) If papers have been filed but are defective, a notice should be written calling attention to the defects or omissions. The application remains suspended and if the papers are completed in time, it will be treated as in (b).

(d) In other cases, where the papers have not been filed, a letter is to be written calling attention to the act and to the last paragraph of Order 3662. The application remains suspended and if the papers are filed in time, it will be treated as in (b) or (c).

5. *Other pending applications.* Other pending agent executed applications which are not covered by paragraphs 3 and 4 of this order should have a notice written in them advising the applicant of the status of the application as in subparagraphs (b), (c) or (d) of paragraph 4. If the application is due for action by the Examiner within approximately the next two months, the notice is to be incorporated in the action when it is made. If the application will not be reached for action that soon, a notice should be sent as soon as possible, concluding with the statement that the application will be taken up for action in due course. If the application is not up for action by the Examiner, the notice should be sent immediately after the response by applicant is received. The notice is not necessarily an action in the case. No positive requirement for the papers or for correction or completion should be made. If the application is otherwise ready for allowance, the notice should so state and further action by the Office suspended as heretofore.

6. *Final roundup.* Properly signed and executed papers cannot be filed after August 8, 1947, to validate an agent executed application. A reasonable time after this date, and thereafter, all suspended applications and those up for action in which the proper papers have not been filed, or have not been filed in time, should be taken up by the Examiner and a notice of abandonment sent.

7. *Reference to Supervisors.* All applications in which a notice, or an action embodying a notice, as required by paragraphs 3, 4, 5, and 6 is being sent should be forwarded to the Supervisory Examiners, with the notice or action, before the letter is mailed. The Supervisory Examiners, in addition to reviewing the letters, will keep an index of all agent executed applications, and will forward the file to the Application Division for entry on its records and endorsement of the front of the file whenever necessary.

CASPER W. OOMS.
Commissioner.

Notice

EXTENSION OF PERIOD OF PRIORITY

PRELIMINARY NOTICE

U. S. PATENT OFFICE, *Washington 25, D. C., Aug. 30, 1946.*

1. Applicants for United States patents, or patentees, seeking an extension of the period of priority under section 1 of Public Law 690, approved August 8, 1946, are required by the act to make a specific request in writing, and to supply a certified copy of the foreign application, a sworn translation of the same if it is not in the English language, and, when necessary, proof of identity of parties.

2. Until and unless the required material is furnished, Examiners will act on applications in the usual way, that is, they will cite and use whatever references and grounds of rejection may be applicable, considering the actual filing date of the application in the United States as the only date to which it is entitled. However, where the statutory bar based on the granting of a foreign patent on an application filed more than one year prior to the filing of the application in the United States is applicable, the Examiner should, as far as possible, also apply other pertinent references and grounds so that in the event the statutory bar is subsequently removed by recourse to the act, prosecution of the application will have been advanced. Applicants must reply to Office actions within the stautory time limit and make as complete replies as are required in any other case.

3. When an application is filed with the object of obtaining the extended period of priority, the allegations in the oath with respect to patenting, publication and public use more than one year prior to the application may be modified in accordance with the last paragraph of section 1 of the act, but the customary oath will be required if the extended date is eventually refused. The customary allegation with respect to no prior foreign patenting on an application filed more than one year prior to the application in this country should, of course, be modified to correctly state the facts whenever necessary. Such applications may be filed any time before August 8, 1947, and need not be accompanied by the papers mentioned in the first paragraph hereof.

4. Persons filing the material required by section 1 and requesting the extended period of priority are not then required to prove that reciprocity exists with their particular country. The Patent Office will determine this fact in the first instance and will act accordingly. When reciprocity has been determined in connection with any country a notice will be published in the OFFICIAL GAZETTE.

5. When the required papers are filed and the extended period of priority requested in any case, the Examiner will refer the application immediately to the Supervisory Examiners for instructions as to whether reciprocity exists with respect to the particular country involved and will act accordingly. The existence of reciprocity will be determined by the Commissioner. The Examiners may be instructed to proceed with the examination of the application as to other matters pending this determination.

6. It will also be necessary for the Patent Office to determine in each case that the foreign application is "an application for patent for the same invention" as applied for in the United States (R. S. 4887). This determination will be made in the first instance by the Examiner. Attention is called to the fact that a similar and analogous requirement as to "the same invention" is in the reissue statute, R. S. 4916; mere readability of claims on the earlier case is not always sufficient to constitute "the same invention," and reissue decisions may be considered applicable in determining this question.

7. Any action taken by the Examiner granting or refusing the extended priority date should be referred to the Supervisory Examiners for review before the action is mailed.

8. Requests for extensions of time under section 3 of the act should be accompanied by the appropriate action and by a showing of the cause of the delay. These will be treated procedurally in the same manner as petitions to revive or petitions for delayed payment of a final fee, but a petition fee is not required. An applicant may apply for extensions under both section 1 and section 3 of the act.

9. No application coming under either section 1 or section 3 of the act shall be passed to issue without being first referred to the Supervisory Examiner.

10. Questions arising under the act shall be referred to the Supervisory Examiner.

CASPER W. OOMS,
Commissioner.

REGISTER OF PATENTS AVAILABLE FOR LICENSING OR SALE

(The "Groups" appearing after the patent abstracts are based on the Standard Industrial Classification Manual, Vol. I, Manufacturing Industries, Executive Office of the President, Bureau of the Budget)

Pat. 2,398,178. AIR MOTOR. Patented Apr. 9, 1946. Single cylinder air motor, free from complicated structure, provides automatic operation with intermittent power control for actuating a conventional ratchet gear attached to the cross-feed screw of a gasket cutting machine or the like. A pawl is attached to the free end of a push rod which is rigidly connected to the piston. The cylinder is swivelly mounted to permit rocking movement for holding the pawl against the ratchet gear. When motor is stopped pawl automatically disengages. (Owner) Warren F. Ellison, 523 Milford St., Glendale 3, Calif. Group 35—69. Reg. No. 4,106.

Pat. 2,217,662. GASOLINE DISPENSING APPARATUS. Patented Oct. 15, 1940. Switch of usual gasoline pump is coin controlled. The pump is provided with several chutes to accommodate coins of different denominations so that the quantity of gasoline dispensed depends on the value of the coins inserted. Provision is made to allow regulation of the liquid measuring apparatus in accordance with increases or decreases in the selling price of the gasoline. Owner has working model available. (Owner) L. W. Davis, 6511 Teesdale Ave., North Hollywood, Calif. Group 35—61—73. Reg. No. 4,107.

Pat. 2,182,517. AMUSEMENT DEVICE. Patented Dec. 5, 1939. Board with divided areas of different scoring values and counterweighted pendulum is supported in vertical position. A suction cup with protective disc is attached to free end of pendulum. A bullet striking the disc as pendulum swings causes cup to adhere to surface of board. For convenience in keeping score counter wheels are mounted near top of board. It may be constructed of suitable material to adapt it for use with high powered rifles, toy guns, or air rifles. (Co-owner) Henry Silbereis, 224 L St., Dayton 9, Ohio. Group 39—41. Reg. No. 4,108.

Pat. 2,399,138. SCREW HOLDING ATTACHMENT FOR SCREW DRIVERS. Patented Apr. 23, 1946. The attachment consists of a spring-urged rotatable and slidable sleeve which is fitted to the shank of a screw driver. A conical member, secured to the sleeve functions as a screw centering means; the walls of the conical member being slotted so that inwardly bowed fingers may project into the slots and grip the screw below the head. The fingers are secured to a collar which is rotatable and slidable, allowing the fingers to be adjusted in several positions (slide the fingers in either direction so that the screw may be released, or held for driving or retrieving). A spaced collar above the first mentioned collar limits rotative and axial movement of the attachment as desired. Any variety head may be accommodated. (Owner) Christ Nygaard, Zumbrota, Minn. Group 33—59. Reg. No. 4,109.

Pat. 1,792,001. SYSTEM FOR SUPPRESSING INTERFERING CURRENTS. Patented Feb. 10, 1931. A filter produces superior filtration with given size electrical components, or equal filtration with smaller components, by separating ripple frequencies, shifting the phase of one by 180° and recombining them. (Owner) Invex, Inc., P. O. Box 188, Gainesville, Fla. Group 36—62. Reg. No. 4,110.

Pat. 1,798,658. ULTRA-VIOLET LAMP AND SYSTEM. Patented Mar. 31, 1931. Mercury vapor ultra-violet lamp produces a discharge between spaced electrodes across which the filament is bridged. The lamp may be operated on ordinary house current without the use of a step-up transformer or with special starting devices. (Owner) Invex, Inc., P. O. Box 188, Gainesville, Fla. Group 36—92. Reg. No. 4,111.

Pat. 1,817,612. SOUND REPRODUCING SYSTEM. Patented Aug. 4, 1931. A phonograph pick-up system whereby a capacity pick-up modulates radio frequency energy which is demodulated and fed directly to the speaker without amplification. (Owner) Invex, Inc., P. O. Box 188, Gainesville, Fla. Group 36—61. Reg. No. 4,112.

Pat. 1,822,130. ELECTRICAL CONVERTER. Patented Sept. 8, 1931. A system for producing oscillation in gaseous diodes or rectifiers. (Owner) Invex, Inc., P. O. Box 188, Gainesville, Fla. Group 36—61. Reg. No. 4,113.

Pat. 1,935,738. RADIO RECEIVING SYSTEM Patented Nov. 21, 1933. System employs filters and balanced tuning for reducing interference. (Owner) Invex, Inc., P. O. Box 188, Gainesville, Fla. Group 36—61. Reg. No. 4,114.

Pat. 1,956,121. STATIC SUPPRESSOR SYSTEM. Patented Apr. 24, 1934. Minimizes static in radio receivers by use of parallel wave filters so adjusted that their indicial admittances provide forced oscillations (induced by static) 180 degrees out of phase, thus cancelling out such "shock-excited" responses. (Owner) Invex, Inc., P. O. Box 188, Gainesville, Fla. Group 36—31. Reg. No. 4,115.

Pat. 1,981,583. METHOD OF PRESERVING FRUITS, VEGETABLES, ETC. Patented Nov. 20, 1934. Preservation of fruits, vegetables, juices, etc., by sterilization, using "soft" X-rays, without heat. A method for producing "soft" X-rays over wide areas by means of secondary X-radiation, and the utilization of such emanations for pasteurization and sterilization without heat is described in the patent. (Owner) Invex, Inc., P. O. Box 188, Gainesville, Fla. Group 36—92. Reg. No. 4,116.

Pat. 1,992,146. REGULATOR SYSTEM. Patented Feb. 19, 1935. An automatic voltage or current regulator employing Kathetrons or Thyratrons. (Owner) Invex, Inc., P. O. Box 188, Gainesville, Fla. Group 36—92. Reg. No. 4,117.

Pat. 2,001,836. POWER CONTROL CIRCUITS. Patented May 21, 1935. Group 36—92. Reg. No. 4,118.

Pat. 2,001,837. POWER CONTROL CIRCUITS. Patented May 21, 1935. Group 36—92. Reg. No. 4,119.

Pat. 2,001,838. POWER CONTROL CIRCUITS. Patented May 21, 1935. Group 36—92. Reg. No. 4,120.

Pat. 2,054,496. POWER CONTROL CIRCUITS. Patented Sept. 15, 1936. Group 36—92. Reg. No. 4,121.

Pat. 2,138,731. DETECTOR CIRCUITS. Patented Nov. 29, 1938. Group 36—92. Reg. No. 4,122.

The five patents listed above relate to the use of a rectifier with an external grid (Kathetron) in a wide variety of electrical control circuits, as explained basically in Pat. No. 2,001,836. Electrostatic control of large electric power with the expenditure of infinitesimal energy is accomplished by external grid control in a variety of ways, e. g. with variable resistors or variable condensers to supply grid voltage of variable amplitude, which in Kathetrons provides gradual and continuous variation of plate current without the necessity of phase-shifting circuits. Use of multiple tubes and multiple grids is included. The device has application to a large number of industrial uses, including motor speed control, theater lamp dimming, welding control, weighing, etc. Special forms of rectifiers particularly suited to external control are shown. Pat. No. 2,001,837, besides showing further applications, shows comparative efficiency curves for the described circuits versus other forms of control. Pat. No. 2,001,838 includes application to alarm circuits, metal detection, sign flashers, etc. Pat. No. 2,054,496 describes the use of a single Kathetron across an "impedance" transformer or choke. Pat. No. 2,138,731 makes use of Kathetrons for detection of adjacent bodies, weighing, etc. (Owner) Invex, Inc., P. O. Box 188, Gainesville, Fla.

Pat. 2,138,732. ELECTRIC REGULATOR. Patented Nov. 29, 1938. An automatic voltage regulator without moving parts employs ferro-resonance. Differs from other ferro-resonant regulators in that the load current does not flow through the resonant circuit. Thus very high power (hundreds or thousands of kilowatts) can be handled without unduly increasing the size of the resonant elements. The regulator is virtually independent of magnitude or power factor of load. (Owner) Invex, Inc., P. O. Box 188, Gainesville, Fla. Group 36—21. Reg. No. 4,123.

Pat. 2,150,054. ULTRAVIOLET LAMP. Patented Mar. 7, 1939. Lamp has incandescent and ultraviolet portions in separate parts of the lamp. Also shows modifications employing a glow discharge between two indirect heaters and between mesh electrodes around a central heater. (Owner) Invex, Inc., P. O. Box 188, Gainesville, Fla. Group 36—92. Reg. No. 4,124.

Pat. 2,168,952. VOLTAGE REGULATOR. Patented Aug. 8, 1939. A ferro-resonant means for automatically operating relays or contactors for any purpose including voltage regulation. Provides a means for operating rugged relays positively on any voltage differential, as low as a fraction of a volt between the pull-in and drop-out voltages. (Owner) Invex, Inc., P. O. Box 188, Gainesville, Fla. Group 36—21. Reg. No. 4,125.

Pat. 2,214,879. GENERATOR REGULATOR. Patented Sept. 17, 1940. An automatic, electronic generator voltage regulator normally without moving parts. Employs Thyratrons, Kathetrons, or high vacuum tubes for supplying field excitation to a generator or exciter, and varying such excitation to maintain constant output voltage from the generator. Includes an "anti-hunt" arrangement. (Owner) Invex, Inc., P. O. Box 188, Gainesville, Fla. Group 36—61. Reg. No. 4,126.

Pat. 2,296,269. PHOTOELECTRIC ELECTRONIC TUBE. Patented Sept. 22, 1942. A photo-electric power tube that passes current from zero up to hundreds of amperes in proportionate response to the intensity of light, thus eliminating the necessity of relay tubes, amplification, etc. (Owner) Invex, Inc., Box 188, Gainesville, Fla. Group 36—61. Reg. No. 4,127.

Pat. 2,289,346. DISCHARGE RECTIFIER TUBE WITH INDIRECTLY HEATED CATHODE. Patented July 14, 1942. Comprises, in general, an evacuated metal tube, containing an indirectly heated cathode, an ionizable gas such as argon, at a predetermined pressure, and a grid or control electrode when control of the current flowing through the tube is desired. In one construction the grid is in the form of an external loop or band encircling the tube. However, the grid may be of any form or it may be disposed in the tubes. (Owner) Invex, Inc., P. O. Box 188, Gainesville, Fla. Group 36—61. Reg. No. 4,128.

Pat. 2,327,622. ELECTROMECHANICAL CONNECTION. Patented Aug. 24, 1943. The threads which comprise the base of the conventional incandescent bulb are formed of glass and coated with a heat-fused metallic coating which is either brushed or sprayed on the exterior. The conducting wires of the filament are brought through the coated glass wall and a non-porous solder (tin) applied thus making the mechanical and electrical connection. The lamp may be used in the usual socket or a glass socket, using a similar method of fabrication. The hermetic fused seal or "pinch" customarily used in lamp manufacture is unnecessary. Modifications show the principle applied to bayonet type bases and sockets (automobile lamps) and fuses. (Owner) Invex, Inc., P. O. Box 188, Gainesville, Fla. Groups 32—29; 34—81. Reg. No. 4,129.

Pat. 2,354,031. SPACE DISCHARGE TUBE. Patented July 18, 1944. A mercury pool-type rectifier (normally water-cooled) the firing of which and the magnitude of current through which can be controlled entirely electrostatically with the expenditure of negligible electric energy. Electrostatic control (instead of an auxiliary starting arc) is accomplished by activation of the pool by permanently amalgamated materials. (Owner) Invex, Inc., P. O. Box 188, Gainesville, Fla. Group 36—61. Reg. No. 4,130.

Pat. 2,357,727. METHOD AND MEANS FOR COOLING GLASS WALLED BODIES. Patented Sept. 5, 1944. High-efficiency means for cooling water-cooled tubes by impregnating the tube walls with a metal film, and bonding cooling members thereto. (Owner) Invex, Inc., P. O. Box 188, Gainesville, Fla. Group 36—61. Reg. No. 4,131.

Pat. 2,393,890. TELEVISION SYSTEM. Patented Jan. 29, 1946. A system of television which transmits either the entire image or portions simultaneously as a complex wave without scanning. The whole is designed for materially narrower band widths than the conventional systems. (Owner) Invex, Inc., P. O. Box 188, Gainesville, Fla. Group 36—61. Reg. No. 4,132.

Pat. 2,398,641. SELF-SYNCHRONIZING TELEVISION SYSTEM. Patented Apr. 16, 1946. In this system single impulses are developed at the end of each line and at the end of each picture field and modulated on the carrier during the interval between lines and pictures to control horizontal and vertical scanning action at the receiving station. These signals are applied at the receiving station to stop the forward deflection of the cathode ray. The receiver is not driven into synchronization but follows the various movements of the transmitter in unison. Inventor states that the system is very flexible and will respond to a wide range of pictures in a given time as tuned circuits are not used in developing synchronizing signals. (Owner) John H. Homrighous, 1029 Wenonah Ave., Oak Park, Ill. Group 36—61. Reg. No. 4,133.

Pat. 2,398,642. METHOD AND SYSTEM FOR TELEVISION COMMUNICATION. Patented Apr. 16, 1946. System for producing synchronizing signals to control and time the various impulses required for the production of a picture at both the transmitter and receiver. A feature of this invention is the generation of an alternating voltage wave and the actual transmission of this wave to the receiver whereby the same wave form and frequency may be regenerated and other frequencies generated from the source of power at the receiver. (Owner) John H. Homrighous, 1029 Wenonah Ave., Oak Park, Ill. Group 36—61. Reg. No. 4,134.

Pat. 1,777,823. MEANS FOR OPERATING MUSICAL MUTES. Patented Oct. 7, 1930. This invention describes a mute for a wind instrument. It is either supported in an elevated position (such as on a music stand) and used by forcing the bell of the instrument over it, or it may be supported on a springed rod or wire on the instrument itself. The musician is thus allowed practically continuous use of his hands in operating the instrument. (Owner) Harry Bernard, 207 Newark St., Hoboken, N. J. Group 39—39. Reg. No. 4,135.

Des. 143,965. DESIGN FOR A CHIMNEY-COWL. Patented Feb. 26, 1946. (Co-owner) Thomas V. Early, 2324 West Fayette St., Baltimore 23, Md. Groups 32—59; 34—41. Reg. No. 4,136.

TRADE-MARKS

OFFICIAL GAZETTE, OCTOBER 8, 1946

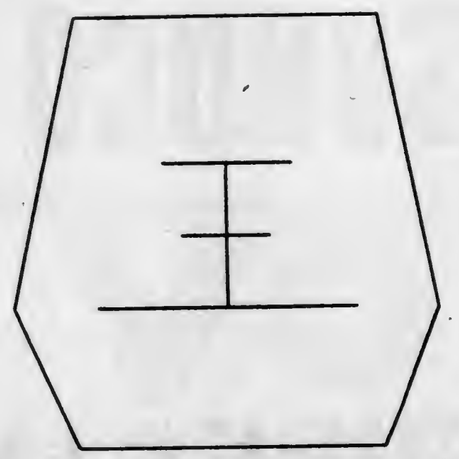
[VOL. 591. No. 2]

The following trade-marks are published in compliance with section 6 of the act of February 20, 1905, as amended March 2, 1907. Notice of opposition must be filed within thirty days of this publication.

Marks applied for "under the ten-year proviso" are registrable under the provision in clause (b) of section 5 of said act as amended February 18, 1911.

As provided by section 14 of said act, a fee of ten dollars must accompany each notice of opposition.

CLASS 1



RAW OR PARTLY PREPARED MATERIALS

Ser. No. 493,277. WILLIAM H. NIEMANN & Co., New York, N. Y. Filed Dec. 14, 1945.

FOR FLOWER SEEDS, GRASS SEED, BULBS, AND PLANTS, ALL IN THE HORTICULTURAL GROUP.
Claims use since 1915.

Ser. No. 497,860. HERBERT J. HERIBERT, New York, N. Y. Filed Mar. 8, 1946.

FOR PLASTIC COMPOSITION IN SHEET FORM USED FOR VARIOUS MANUFACTURING PURPOSES IN THE ARTS.
Claims use since Mar. 1, 1946.

CLASS 2

RECEPTACLES

Ser. No. 505,863. SOUTHERN ADVANCE BAG & PAPER CO. INC., Bangor, Maine, and Boston, Mass. Filed July 18, 1946.

STEER BRAND

No claim is made to the exclusive use of the word "Brand" per se.
FOR PAPER BAGS.
Claims use since July 9, 1946.

CLASS 3

BAGGAGE, ANIMAL EQUIPMENTS, PORTFOLIOS, AND POCKETBOOKS

Ser. No. 493,325. CONSOLIDATED COSMETICS, Chicago, Ill. Filed Dec. 15, 1945.

TABU

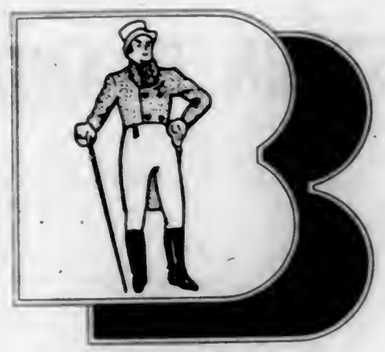
FOR LEATHER COSMETIC KIT BAGS AND CASES, FITTED OR UNFITTED HANDBAGS, WALLETS, PURSES, SUITCASES, AND KEY CASES.
Claims use since Nov. 30, 1945.

Ser. No. 506,602. JANA HANDBAGS, INC., New York, N. Y. Filed July 31, 1946.

JANALOPE

FOR LADIES' HANDBAGS.
Claims use since Sept. 1, 1945.

CLASS 4



ABRASIVE, DETERGENT, AND POLISHING MATERIALS

Ser. No. 487,598. DOHRMANN HOTEL SUPPLY CO., San Francisco, Calif. Filed Aug. 27, 1945.

DOHRCO

FOR JANITORIAL SUPPLIES—NAMELY, METAL CLEANERS, GLASS CLEANERS, WALL CLEANERS, WOODWORK CLEANERS, METAL POLISHES, AND GLASS POLISHES.
Claims use since Mar. 1, 1928.

Ser. No. 494,650. BEAU BRUMMEL POLISH CORP., Brooklyn, N. Y. Filed Jan. 12, 1946.

The picture of the man is fanciful.
FOR SHOE POLISH.
Claims use since March 1920.

Ser. No. 495,012. CLARK CLEVELAND, INC., Binghamton, N. Y. Filed Jan. 19, 1946.

PLATO

FOR DENTAL PLATE CLEANER, IN POWDER FORM.
Claims use since Dec. 19, 1945.

Ser. No. 495,053. LES PARFUMS DE DANA, INC., New York, N. Y. Filed Jan. 19, 1946.

"HONI SOIT QUI MAL Y PENSE"

The translation of the phrase "Honi Soit Qui Mal Y Pense" reads, "Evil be to him who evil thinks."
FOR TOILET SOAPS.
Claims use since Dec. 31, 1945.

Ser. No. 495,374. GOJER LABORATORIES, Akron, Ohio. Filed Jan. 25, 1946.

GO JO

FOR DETERGENTS, SUCH AS HAND, AUTO, WOODWORK, VENETIAN BLINDS, AND PAINTED SURFACE CLEANER.
Claims use since Dec. 1, 1945.

Ser. No. 495,588. COLGATE-PALMOLIVE-PEET COMPANY, Jersey City, N. J. Filed Jan. 29, 1946.

CRO

FOR HOUSEHOLD CLEANSER.
Claims use since Jan. 25, 1946.

Ser. No. 495,589. COLGATE-PALMOLIVE-PEET COMPANY, Jersey City, N. J. Filed Jan. 29, 1946.

BIG MO

FOR HOUSEHOLD CLEANSER.
Claims use since Jan. 25, 1946.

CLASS 5

ADHESIVES

Ser. No. 496,846. SUN OIL COMPANY, Philadelphia, Pa. Filed Feb. 9, 1946.

SUNOCO

FOR RUBBER VULCANIZING CEMENT AND CEMENTITIOUS VULCANIZING GUM.
Claims use since Aug. 24, 1944.

Ser. No. 497,903. VELSICOL CORPORATION, Chicago, Ill. Filed Mar. 8, 1946.

CORESIN

FOR CORE OILS.
Claims use since Feb. 1, 1946.

Ser. No. 500,985. THE KEEVER STARCH COMPANY, Columbus, Ohio. Filed Apr. 26, 1946.

Applicant disclaims the word "Product" as used apart from the mark.
FOR WALL SIZE.
Claims use since Mar. 11, 1946.

CLASS 6

CHEMICALS, MEDICINES, AND PHARMACEUTICAL PREPARATIONS

Ser. No. 480,260. WITCO CHEMICAL COMPANY, Chicago, Ill. Filed Feb. 26, 1945.

MONTY WAX

Applicant disclaims the word "Wax" as constituting a part of the mark.
FOR HARD WAX-LIKE SUBSTANCE COMPOSED OF SEVERAL CHEMICALS, CONTAINING NO PETROLEUM DERIVATIVES, USED IN RUBBER COMPOUNDING AND IN PLASTIC COMPOSITION.
Claims use since March 1942.

Ser. No. 484,407. THE KAKTINE COMPANY, Glendale, Calif. Filed June 11, 1945.

KAKTINE

FOR PREPARATION HAVING USE AS A MOUTH WASH AND THROAT GARGLE.
Claims use since May 29, 1945.

Ser. No. 484,910. LEO A. SAUER, doing business as V-O MANUFACTURING CO., Glendale, Calif. Filed June 22, 1945.

V-O

FOR CHEMICAL SOLUTIONS FOR REDUCING CARBON PING IN MOTORS, FOR STIMULATING CRANK CASE OIL, FOR RUST PROOFING, FOR WATER PROOFING AND FIRE PROOFING IGNITIONS, AND FLUIDS FOR HYDRAULIC BRAKES, JACKS, SHOCK ABSORBERS AND KNEE ACTION ELEMENTS.
Claims use since Nov. 15, 1940.

Ser. No. 487,864. RÖHM & HAAS COMPANY, Philadelphia, Pa. Filed Aug. 31, 1945.

RHothane

FOR INSECTICIDES, FUNGICIDES, AND DISINFECTANTS.
Claims use since Aug. 23, 1945.

Ser. No. 489,051. ENDO PRODUCTS, INC., New York, N. Y. Filed Sept. 27, 1945.

COPFERTABS

FOR HEMATINIC.
Claims use since 1938.

Ser. No. 491,251. FLUORDENT, INC., New Orleans, La. Filed Nov. 8, 1945.

FLENE

FOR DENTIFRICE.
Claims use since July 19, 1945.

Ser. No. 492,638. MARWIN DYESTUFF CORPORATION, Jersey City, N. J. Filed Dec. 4, 1945.

AQUARAY

FOR DYESTUFF.
Claims use since Feb. 28, 1940.

Ser. No. 492,642. MARWIN DYESTUFF CORPORATION, Jersey City, N. J. Filed Dec. 4, 1945.

MARAMINE

FOR DYESTUFF.
Claims use since Feb. 28, 1940.

Ser. No. 492,643. MARWIN DYESTUFF CORPORATION, Jersey City, N. J. Filed Dec. 4, 1945.

MARAVAT

FOR DYESTUFF.
Claims use since Feb. 28, 1940.

Ser. No. 492,644. MARWIN DYESTUFF CORPORATION, Jersey City, N. J. Filed Dec. 4, 1945.

MARAZINE

FOR DYESTUFF.
Claims use since Feb. 28, 1940.

Ser. No. 492,645. MARWIN DYESTUFF CORPORATION, Jersey City, N. J. Filed Dec. 4, 1945.

MARSUL

FOR DYESTUFF.
Claims use since Feb. 28, 1940.

Ser. No. 492,646. MARWIN DYESTUFF CORPORATION, Jersey City, N. J. Filed Dec. 4, 1945.

NYLONYX

FOR DYESTUFF.
Claims use since Feb. 28, 1940.

Ser. No. 494,006. TONY BARONE, doing business as Laboratory Products Company, Detroit, Mich. Filed Dec. 29, 1945.

STOMONE

FOR MEDICINES—NAMELY, PREPARATIONS TAKEN INTERNALLY FOR THE TREATMENT OF THE BODY, PARTICULARLY THE GASTRO-INTESTINAL TRACT.
Claims use since Sept. 1, 1945.

Ser. No. 494,557. EVE RAE GROSSMAN, doing business as Cosmetic Arts Laboratories, Upper Montclair, N. J. Filed Jan. 10, 1946.

Yveline

FOR NAIL POLISH, NAIL OIL, SKIN CREAM, AND SHAMPOO.
Claims use since May 1944.

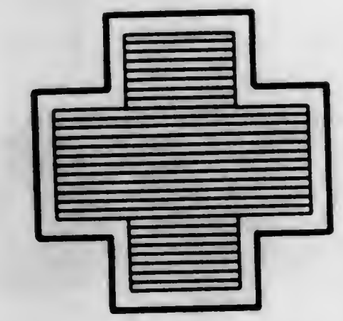
Ser. No. 494,573. WILLIAM PETERMAN, INC., Newark, N. J. Filed Jan. 10, 1946. Under 10-year proviso as to the word "Peterman."

Peterman
FLYOSAN

FOR INSECTICIDE.
Claims use since Nov. 21, 1945, in its present form; and since 1886 as to the word "Peterman."

Ser. No. 494,715. SHARP & DOHME, INCORPORATED, Philadelphia, Pa. Filed Jan. 12, 1946.

TYOTOCIN



FOR ANTIBACTERIAL AND EAR DROP PREPARATION WITH ANALGESIC AND ANESTHETIC PROPERTIES.
Claims use since Jan. 7, 1946.

Ser. No. 495,297. LA FRANCE INDUSTRIES, Philadelphia, Pa. Filed Jan. 24, 1946.

Sanigene

FOR DISINFECTANT AND MILDEW AND BACTERIA PREVENTATIVE TO BE APPLIED TO THE FABRIC AND FILLING MATERIAL OF UPHOLSTERY AND MATTRESSES.
Claims use since Nov. 7, 1945.

Ser. No. 497,085. THE FARM MINERALS COMPANY, INC., Fishers, Ind. Filed Feb. 23, 1946.

The drawing is lined for the color blue.
FOR SUPPLEMENT FOR FEED FOR POULTRY, LIVE STOCK OR OTHER ANIMALS WHEREIN THE SUPPLEMENT IS PREDOMINANTLY OF MINERAL OR CHEMICAL CHARACTER.
Claims use since Sept. 1, 1940.

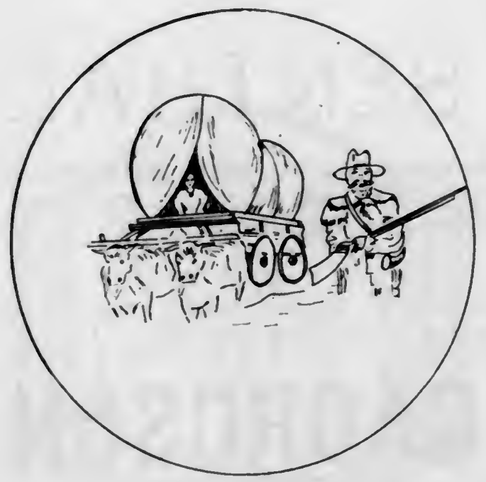
Ser. No. 497,278. TEASDALE & CO: LIMITED, Carlisle, England. Filed Feb. 26, 1946.

NIPITS

FOR MEDICATED SWEETMEATS FOR THE RELIEF OF THROAT AND CHEST IRRITATION.
Claims use since June 30, 1932.

Ser. No. 497,472. THE RAY EWING COMPANY, South Pasadena, Calif. Filed Mar. 1, 1946.

ANIMIX



FOR VITAMIN AND AMINO ACID SUPPLEMENT FOR FOUR-FOOTED ANIMAL FEEDS.
Claims use since Oct. 1, 1945.

Ser. No. 497,493. PLANT PRODUCTS CORPORATION, Blue Point, N. Y. Filed Mar. 1, 1946.

Dandy-Kill

Applicant disclaims the word "Kill" apart from the mark.
FOR WEED KILLER USED AS A SPRAY OR DUST TO CONTROL WEEDS.
Claims use since Sept. 24, 1945.

Ser. No. 497,504. STABER'S FOR BEAUTY, Los Angeles, Calif. Filed Mar. 1, 1946.

FOR WAVE CREAM, HAIR DRESSING, AND OIL HAIR DRESSING.
Claims use since 1935.

Ser. No. 497,614. THE MATHIESON ALKALI WORKS, New York, N. Y. Filed Mar. 4, 1946.

Q.A.D

FOR QUATERNARY AMMONIUM SANITIZING POWDER FOR USE AS A GERMICIDE, BACTERICIDE, DISINFECTANT, AND DEODORANT.
Claims use since Jan. 18, 1946.

Ser. No. 497,615. THE MATHIESON ALKALI WORKS, New York, N. Y. Filed Mar. 4, 1946.

Q.A.S

FOR QUATERNARY AMMONIUM SANITIZING SOLUTION FOR USE AS A GERMICIDE, BACTERICIDE, DISINFECTANT, AND DEODORANT.
Claims use since Jan. 18, 1946.

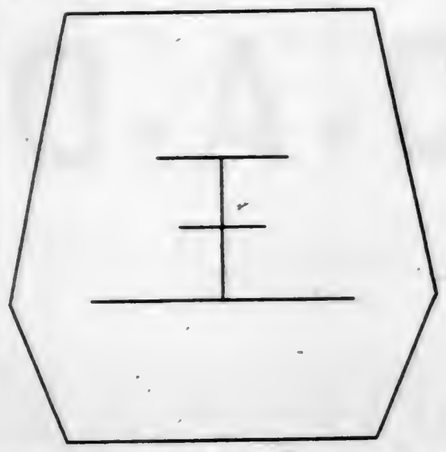
Ser. No. 497,616. THE MATHIESON ALKALI WORKS, New York, N. Y. Filed Mar. 4, 1946.

CLAROFIN

FOR QUATERNARY AMMONIUM SANITIZING SOLUTION FOR USE AS A GERMICIDE, BACTERICIDE, DISINFECTANT, AND DEODORANT.
Claims use since Jan. 18, 1946.

Ser. No. 497,735. PARFUMS CHARBERT, INC., New York, N. Y. Filed Mar. 6, 1946.

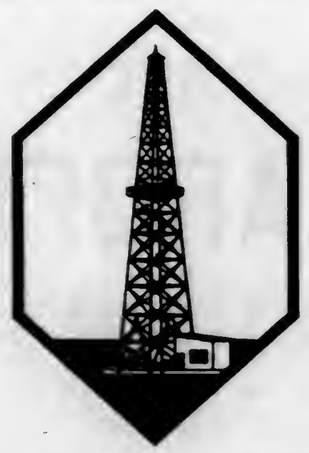
AMOROUS



FOR PERFUMES, TOILET WATERS, EAU DE COLOGNES, SACHET POWDERS, TALCUM POWDER, FACE POWDER, BATH POWDER, FACE CREAMS, CLEANSING CREAMS, LIPSTICK, AND ROUGE.
Claims use since Feb. 13, 1946.

Ser. No. 497,789. GILCOR MANUFACTURING COMPANY, INC., New York, N. Y. Filed Mar. 7, 1946.

LIQUICK



FOR LIQUID LAUNDRY STARCH.
Claims use since Jan. 16, 1946.

Ser. No. 497,861. HERBERT J. HERIBERT, New York, N. Y. Filed Mar. 8, 1946.

FOR SOLUTION TO BE USED AS A COATING, FINISH OR LACQUER FOR TEXTILES AND FOR PLASTICS, AND PARTICULARLY FOR TEXTILES MADE OF NATURAL, SYNTHETIC OR MIXED YARNS OR GLASS FIBERS FOR WATERPROOFING, MILDEWPROOFING, FLAMEPROOFING AND MOTHPROOFING.
Claims use since Mar. 1, 1946.

Ser. No. 497,864. JEFFERSON CHEMICAL COMPANY, INC., New York, N. Y. Filed Mar. 8, 1946.

FOR ETHYLENE OXIDE AND ETHYLENE GLYCOL.
Claims use since Feb. 21, 1946.

Ser. No. 498,027. PARKE, DAVIS & COMPANY, Detroit, Mich. Filed Mar. 11, 1946.

MIAQUIN

FOR ANTI-MALARIAL PREPARATION.
Claims use since Feb. 4, 1946.

Ser. No. 498,079. PURITY DRUG CO., INC., Passaic, N. J. Filed Mar. 12, 1946.

PERF

FOR CREAM DEODORANT.
Claims use since Jan. 2, 1946.

Ser. No. 498,092. SOCONY-VACUUM OIL COMPANY, INCORPORATED, New York, N. Y. Filed Mar. 12, 1946.

SOVABEAD

FOR POROUS INORGANIC MATERIAL EMPLOYED IN THE TREATMENT OF AIR AND OTHER GASES, LIQUIDS AND SOLIDS PARTICULARLY AS A DESICCANT OR DEHUMIDIFIER.
Claims use since Feb. 20, 1946.

Ser. No. 498,139. GEORGE C. HESTER, Glendale, Calif., doing business as Janet Hester, Hollywood, Calif. Filed Mar. 13, 1946.

ACQUIESCE

FOR PERFUMES.
Claims use since Mar. 5, 1946.

Ser. No. 498,140. GEORGE C. HESTER, Glendale, Calif., doing business as Janet Hester, Hollywood, Calif. Filed Mar. 13, 1946.

COAX

ME

FOR PERFUMES.
Claims use since Mar. 5, 1946.

Ser. No. 498,241. MONSANTO CHEMICAL COMPANY, St. Louis, Mo. Filed Mar. 14, 1946.

BENTHAL

FOR CHEMICALS FOR USE IN MAKING SYNTHETIC RESINS AND PLASTICS.
Claims use since Jan. 5, 1946.

Ser. No. 498,257. SHARP & DOHME, INCORPORATED, Philadelphia, Pa. Filed Mar. 14, 1946.

CADROSON

FOR VITAMIN AND MINERAL PREPARATION FOR USE IN THE PREVENTION AND TREATMENT OF METABOLIC DEFICIENCIES.
Claims use since Oct. 19, 1945.

Ser. No. 498,573. AIRKEM, INC., New York, N. Y. Filed Mar. 20, 1946.

OSMIX

FOR PREPARATIONS FOR FRESHENING OR DEODORIZING THE AIR.
Claims use since Feb. 1, 1946.

Ser. No. 498,635. JEROME D. KENNEDY, doing business as United Chemical Company, Rutland, Vt. Filed Mar. 20, 1946.

ZETO

FOR INSECTICIDES.
Claims use since Sept. 11, 1945.

Ser. No. 498,905. F. P. KEENOY, doing business as Keen-Aire Research Laboratories, Kansas City, Mo. Filed Mar. 25, 1946.

KEEN-AIRE

The term "Aire" is disclaimed apart from the mark.
FOR DEODORIZIING MATERIAL FOR CLOSED SPACES SUCH AS REFRIGERATORS AND ROOMS IN BLOCK FORM.
Claims use since May 12, 1945.

Ser. No. 498,986. DE MARBEL (SOCIÉTÉ À RESPONSABILITÉ LIMITÉE), Neuilly sur Seine, France. Filed Mar. 26, 1946.

AMBASSADE DE PARIS

No claim is made to the name "Paris" apart from the mark.
FOR PERFUMES, TOILET WATERS, ROUGE, LIPSTICK, AND FACE CREAM.
Claims use since Aug. 12, 1931.

Ser. No. 498,992. STORRS H. HALL, Southgate, Calif. Filed Mar. 26, 1946.

No claim is made to the representation of the label.
FOR PERFUME.
Claims use since Feb. 28, 1946.

Ser. No. 499,076. STEPHEN E. RILEY, doing business as Stephen Riley Company, Los Angeles, Calif.

Clishay by Legendre'

No claim is made to the word "Legendré" apart from the mark.
FOR PERFUME.
Claims use since Feb. 11, 1946.

Ser. No. 499,138. LAFAYETTE DRUG COMPANY, INC., doing business as Kotalko Sales Company, Jersey City, N. J. Filed Mar. 28, 1946.

KOTALKO

FOR HAIR TONICS AND OINTMENT FOR BEAUTIFYING AND TREATING THE HAIR AND SCALP.
Claims use since Apr. 1, 1919.

Ser. No. 499,231. HUDSON PRODUCTS, INC., Jersey City, N. J. Filed Mar. 29, 1946.

POLI-GRIP

No claim is made to the word "Grip" apart from the mark.
FOR CREAM FOR HOLDING FALSE TEETH TIGHTLY.
Claims use since Mar. 1, 1946.

Ser. No. 499,416. KEMP AND LANE, INC., Leroy, N. Y. Filed Apr. 1, 1946.

Herbitol

FOR PREPARATION FOR INDIGESTION, CONSTIPATION, HEARTBURN, COATED TONGUE, LOSS OF APPETITE, INACTIVE BOWELS, SOUR STOMACH, GAS-BELCHING, FLATULENCE, AND BAD TASTE IN THE MOUTH.
Claims use since June 10, 1916.

Ser. No. 499,548. MAUDE GONYEA, Hazel Park, Mich. Filed Apr. 3, 1946.

Maude Gonyea

The name presented as the mark constitutes an autographic signature of the applicant.
FOR HAIR RESTORER.
Claims use since Nov. 1, 1933.

Ser. No. 499,787. LENTHERIC, INCORPORATED, New York, N. Y. Filed Apr. 6, 1946.

FEU FROID

FOR PERFUMES, TOILET WATERS, AND COSMETIC CREAMS.
Claims use since Mar. 20, 1946.

Ser. No. 499,788. LENTHERIC, INCORPORATED, New York, N. Y. Filed Apr. 6, 1946.

BEYOND

FOR PERFUMES, TOILET WATERS, AND COSMETIC CREAMS.
Claims use since May 20, 1946.

Ser. No. 499,789. LENTHERIC, INCORPORATED, New York, N. Y. Filed Apr. 6, 1946.

SOMETIME

FOR PERFUMES, TOILET WATERS, AND COSMETIC CREAMS.
Claims use since Mar. 20, 1946.

Ser. No. 499,790. LENTHERIC, INCORPORATED, New York, N. Y. Filed Apr. 6, 1946.

OCCASION

FOR PERFUMES, TOILET WATERS, AND COSMETIC CREAMS.
Claims use since Mar. 20, 1946.

CLASS 7

CORDAGE

Ser. No. 504,944. TUBBS CORDAGE COMPANY, San Francisco, Calif. Filed July 1, 1946.

PACORD

FOR PAPER COVERED TWINE.
Claims use since Dec. 1, 1926.

CLASS 8

SMOKERS' ARTICLES, NOT INCLUDING TOBACCO PRODUCTS

Ser. No. 497,331. CHARLES M. PRITZKER, New York, N. Y. Filed Feb. 27, 1946.

POLY

FOR PLASTIC CIGARETTE CONTAINER IN THE NATURE OF CIGARETTE CASES.
Claims use since Nov. 15, 1945.

Ser. No. 497,923. EDITH B. DUELL, Detroit, Mich. Filed Mar. 9, 1946.

Solitaire

FOR CIGARETTE CASES.
Claims use since Feb. 20, 1946.

CLASS 10

FERTILIZERS

Ser. No. 488,418. PLYMOUTH WHOLESALE DRY GOODS CORPORATION, New York, N. Y. Filed Sept. 13, 1945. Under the act of February 20, 1905, as amended June 10, 1938.

Hearthstone

FOR FERTILIZERS.
Claims use since Feb. 13, 1945.

CLASS 13

HARDWARE AND PLUMBING AND STEAM-FITTING SUPPLIES

Ser. No. 490,510. STOR-AID, INC., New York, N. Y. Filed Oct. 25, 1945.

EDGE-AID

Applicant disclaims the right to the use of the word "Edge" except in the relation and association shown.
FOR DECORATIVE EDGINGS OF PLASTIC MATERIAL FOR SHELVES.
Claims use since Feb. 1, 1945.

Ser. No. 498,037. SWALLOW AIRPLANE COMPANY, INC., Wichita, Kans. Filed Mar. 11, 1946.

DOORMASTER

FOR DOOR CHECKS.
Claims use since Feb. 20, 1946.

CLASS 14

METALS AND METAL CASTINGS AND FORGINGS

Ser. No. 472,905. METAL AND ALLOY SPECIALTIES COMPANY, INC., Buffalo, N. Y. Filed Aug. 3, 1944.

METALOY

FOR METAL CASTINGS MADE OF ALLOY METAL, BRONZE, OR ALUMINUM.
Claims use since July 15, 1930.

CLASS 15

OILS AND GREASES

Ser. No. 485,425. SOCIETE ANONYME SOLEX, Neuilly-sur-Seine (Seine), France. Filed July 3, 1945.

SOLEXINE

FOR PETROLEUM PRODUCTS CONSISTING OF GASOLINE, LUBRICATING OILS, LUBRICATING GREASES, AND A MIXTURE OF GASOLINE AND LUBRICATING OIL ADAPTED FOR USE IN TWO-STROKE ENGINES.
Claims use since Mar. 2, 1942.

CLASS 16

PAINTS AND PAINTERS' MATERIALS

Ser. No. 488,339. MAAS & WALDSTEIN COMPANY, Newark, N. J. Filed Sept. 12, 1945.

DUART

FOR COATING COMPOSITIONS INCLUDING CLEAR WRINKLE VARNISHES AND PIGMENTED WRINKLE ENAMELS ADAPTED TO PRODUCE WRINKLE FINISHES.
Claims use since July 1, 1934.

Ser. No. 488,421. PLYMOUTH WHOLESALE DRY GOODS CORPORATION, New York, N. Y. Filed Sept. 13, 1945. Under the act of February 20, 1905, as amended June 10, 1938.

Hearthstone

FOR FLOOR FURNITURE AND AUTOMOBILE WAXES AND POLISHES; PAINTS SOLD IN DRY, PASTE, AND READY-MIXED FORM.
Claims use since Feb. 13, 1945.

Ser. No. 497,251. DAVID E. KENNEDY, INC., Brooklyn, N. Y. Filed Feb. 26, 1946.

KENWAX

FOR WAX TO PRESERVE, PROTECT, AND POLISH ASPHALT TILE, CORK TILE, RUBBER TILE, CORK COMPOSITION, LINOLEUM, AND HARDWOOD FLOORS.
Claims use since Jan. 1, 1938.

CLASS 17

TOBACCO PRODUCTS

Ser. No. 499,319. CONSTITUTION TOBACCO PRODUCTS CORP., New York, N. Y. Filed Mar. 30, 1946.

CONSTITUTION

FOR CIGARETTES.
Claims use since Mar. 25, 1946.

CLASS 21

ELECTRICAL APPARATUS, MACHINES, AND SUPPLIES

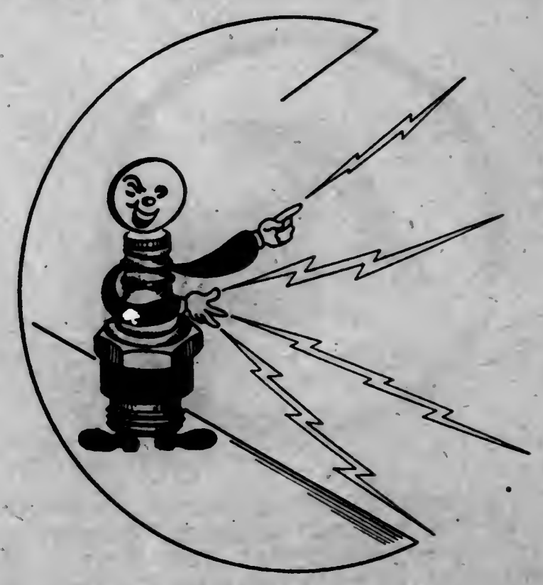
Ser. No. 481,021. GENERAL CERAMICS AND STEATITE CORPORATION, Keasbey, N. J. Filed Mar. 17, 1945.

SEALEX

FOR ELECTRICAL APPARATUS IN THE NATURE OF COMBINATIONS OF METALS AND CERAMICS—NAMELY, HERMETICALLY SEALED TRANSFORMER BUSHINGS, VIBRATOR BUSHINGS, CONDENSER BUSHINGS, COAXIAL LINE TERMINATOR BUSHINGS, ANTENNA LEAD-IN BUSHINGS, VACUUM TUBE TERMINAL BUSHINGS, CRYSTAL CASES, CONDENSER SHAFTS, THREADED METAL INSERTS, VACUUM TUBES AND CATHODE RAY TUBES.
Claims use since May 3, 1944.

Ser. No. 493,788. LEXINGTON MACHINERY & DEVELOPMENT CO., INC., Clifton, N. J. Filed Dec. 22, 1945.

Toast-O-Matic



The exclusive use of the word "Toast" apart from the mark is disclaimed.
FOR ELECTRIC TOASTERS.
Claims use since Nov. 23, 1945.

Ser. No. 497,990. THE BIRD ELECTRONIC CORPORATION, Cleveland, Ohio. Filed Mar. 11, 1946.

COAXWITCH

FOR ELECTRICAL SWITCHES.
Claims use since Dec. 31, 1945.

Ser. No. 498,727. SPARKY SPECIALTIES, INC., Chicago, Ill. Filed Mar. 21, 1946.

The picture of the spark plug is disclaimed apart from the mark.
FOR ELECTRICAL COILS, ELECTRICAL SWITCHES AND CONDENSERS.
Claims use since Feb. 26, 1946.

Ser. No. 498,752. BREUER ELECTRIC MFG. CO., Chicago, Ill. Filed Mar. 22, 1946.

TORNADO

FOR ELECTRIC MARKERS AND ETCHERS FOR CUTTING OR ETCHING INDICIA ON GLASS, METAL, WOOD, PORCELAIN, OR PLASTICS.
Claims use since January 1942.

Ser. No. 498,753. BREUER ELECTRIC MFG. CO., Chicago, Ill. Filed Mar. 22, 1946.

TORNADO

FOR ELECTRIC DUST COLLECTORS FOR WOOD WORKING MACHINES.
Claims use since April 1937.

Ser. No. 498,817. VIRAGON PRODUCTS, Kansas City, Mo. Filed Mar. 22, 1946.

VIRAGON

FOR ELECTRIC LAMPS EMITTING ULTRAVIOLET RAYS FOR GERMICIDAL PURPOSES AND UNITARY COMBINATION STERILIZING EQUIPMENT—NAMELY, ELECTRIC LAMPS EMITTING ULTRAVIOLET RAYS FOR GERMICIDAL PURPOSES AND ELECTRICALLY OPERATED OZONE GENERATOR, AND ELECTRICALLY OPERATED OZONE GENERATORS.
Claims use since Jan. 11, 1946.

Ser. No. 499,984. AMERICAN ENGINEERING COMPANY, Philadelphia, Pa. Filed Apr. 11, 1946.

AE

FOR ELECTRIC HOISTS, ELECTRIC WINCHES, ELECTRIC WINDLASSES, ELECTRIC CAPSTANS, ELECTRIC GYPSIES (GYPSIES ARE SIMILAR IN SOME RESPECTS TO POWER OPERATED CAPSTANS BUT GENERALLY HAVE ONLY ONE MECHANICAL SPEED AND ARE NEVER ARRANGED FOR HAND OPERATION), AND ELECTRIC STEERING GEARS, AND PARTS THEREOF.
Claims use since Feb. 13, 1945.

CLASS 22

GAMES, TOYS, AND SPORTING GOODS

Ser. No. 502,761. ROBERT MOORE, Montclair, N. J. Filed May 25, 1946.

POLYMOORE

FOR ALL WHITE, NON-FABRIC, LAWN TENNIS COURT MARKING TAPE.
Claims use since May 17, 1946.

Ser. No. 504,172. GEORGE M. GALLOWAY, doing business as Grand Lake Fishing Tackle, Celina, Ohio. Filed June 19, 1946.

LADY STREAMER

No claim is made to the word "Streamer" apart from the mark.
FOR ARTIFICIAL FISH BAITS.
Claims use since March 1945.

Ser. No. 504,267. J. J. GILL & ASSOCIATES, Los Angeles, Calif. Filed June 20, 1946.

BASS BIRD

The word "Bass" is disclaimed apart from the mark.
FOR ARTIFICIAL FISH BAIT.
Claims use since June 1, 1946.

Ser. No. 505,862. RALPH L. SANTOS, doing business as R. L. Santos Company, Cambridge, Mass. Filed July 18, 1946.

LOOP-THE-LOOP

FOR GAMES HAVING TWO SUSPENDED BALLS AND A GOAL ABOVE ONE BALL.
Claims use since July 12, 1946.

Ser. No. 506,183. MONUMENTAL BOWLING AND BILLIARD SUPPLY COMPANY, Baltimore, Md. Filed July 24, 1946.

STRIKEASY

FOR BOWLING PINS.
Claims use since June 29, 1946.

Ser. No. 506,573. ARTCRAFT METAL PRODUCTS, INC., West Haven, Conn. Filed July 31, 1946.

JUNIOR MISS

FOR TOY SEWING MACHINES.
Claims use since Apr. 15, 1946.

Ser. No. 506,729. THE BRUNSWICK-BALKE-COLLENDER COMPANY, Wilmington, Del., and Chicago, Ill. Filed Aug. 2, 1946.

STRIKE KING

FOR BOWLING BALLS.
Claims use since June 13, 1946.

Ser. No. 506,798. THE CALDEX COMPANY, Sheldon, Ill. Filed Aug. 3, 1946.

Scoot

FOR TOY GLIDERS.
Claims use since July 17, 1946.

CLASS 23

CUTLERY, MACHINERY, AND TOOLS, AND PARTS THEREOF

Ser. No. 481,617. THE ELECTRIC SPRAYIT CO., Sheboygan, Wis. Filed Apr. 2, 1945.

ESCO

FOR HYDRAULIC ACTUATING CYLINDERS, HYDRAULIC OPERATING VALVES, AIR COMPRESSORS, AIR OPERATED SPRAYERS, AIR OPERATED LIQUID PUMPS, COMBINATION UNIT OF AIR FILTER AND FLOW REGULATOR FOR USE IN PAINT SPRAYING APPARATUS, AND PARTS THEREOF.
Claims use since Apr. 2, 1944.

Ser. No. 489,725. ESSICK MANUFACTURING COMPANY, Los Angeles, Calif. Filed Oct. 10, 1945.

BIG BOY

The word "Big" is disclaimed apart from the mark.
FOR CONCRETE MIXERS.
Claims use since Apr. 19, 1945.

Ser. No. 494,620. MARKWELL MFG. CO., INC., New York, N. Y. Filed Jan. 11, 1946.

MARVEL

FOR STAPLING MACHINES USED FOR FASTENING PAPERS, CARDBOARD, FABRICS, AND METAL TOGETHER, ALSO FOR FASTENING PAPERS, CARDBOARD, FABRICS, AND METAL ONTO WOOD.
Claims use since Dec. 21, 1945.

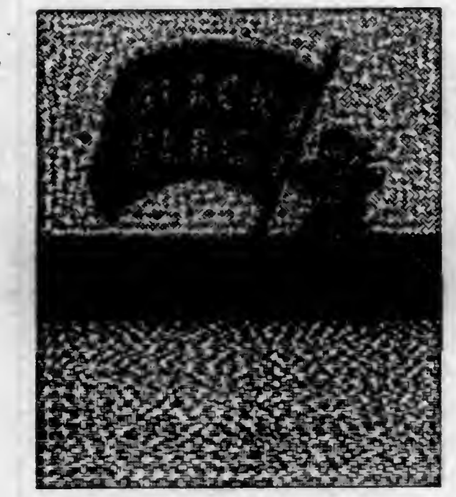
Ser. No. 494,821. JOSEPH W. DAVIS, doing business as J. W. Davis Company, Bloomington, Ill. Filed Jan. 16, 1946.

SKOOTER

FOR BELT TYPE CONVEYING APPARATUS MOUNTED ON AND USED WITH MOTOR TRUCKS HAVING DUMP BODIES IN THE HANDLING OF COAL AND BULK MATERIALS.
Claims use since June 10, 1944.

Ser. No. 494,826. EATON MANUFACTURING COMPANY, Cleveland, Ohio. Filed Jan. 16, 1946.

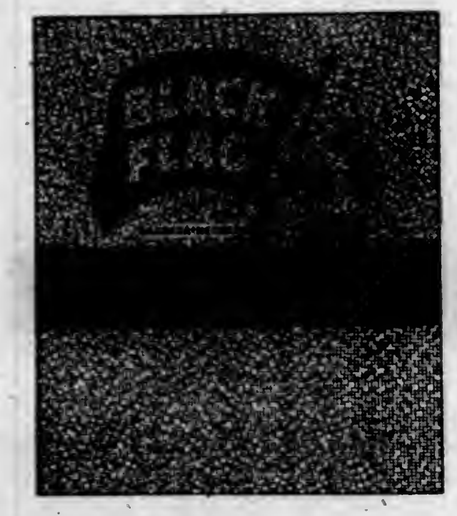
EATONITE



FOR HEAT, WEAR, CORROSION, AND EROSION RESISTANT POPPET VALVE MECHANISMS, FACINGS AND PARTS THEREOF FOR FUEL BURNING ENGINES, ENGINE CAMS AND PARTS THEREOF, AND TURBINE AND SUPERCHARGER BLADES, BUCKETS, AND PARTS THEREOF.
Claims use since December 1945.

Ser. No. 498,101. WOOLDRIDGE MANUFACTURING COMPANY, Sunnyvale, Calif. Filed Mar. 12, 1946.

TERRA-CLIPPER



The word "Terra" is disclaimed apart from the mark.
FOR EARTH MOVING CARRIER SCRAPERS.
Claims use since Mar. 1, 1945.

Ser. No. 499,476. BOYLE-MIDWAY INC., Jersey City, N. J. Filed Apr. 2, 1946.

The drawing is lined to indicate the colors orange and yellow and shaded to indicate black.
FOR HAND SPRAYERS FOR INSECTICIDES AND THE LIKE.
Claims use since Mar. 8, 1946; and on the words "Black Flag" and the representation of a flag since 1925.

Ser. No. 499,477. BOYLE-MIDWAY INC., Jersey City, N. J. Filed Apr. 2, 1946.

The drawing is lined to indicate the colors orange and yellow and shaded to indicate black.
FOR HAND SPRAYERS FOR INSECTICIDES AND THE LIKE.
Claims use since Mar. 8, 1946; and on the words "Black Flag" and the representation of a flag since 1925.

Ser. No. 499,971. STANDARD BLADE CO., INC., New York, N. Y. Filed Apr. 10, 1946.

OKey

FOR RAZOR BLADES.
Claims use since June 1944.

CLASS 26

MEASURING AND SCIENTIFIC APPLIANCES

Ser. No. 491,578. KOLLMORGEN OPTICAL CORPORATION, Brooklyn, N. Y. Filed Nov. 14, 1945.

K C

FOR OPTICAL GOODS—NAMELY, PROJECTION LENSES, OPTICAL LENSES AND COMBINATIONS FOR SOUND TRACKS, TELESCOPIC SPECTACLES, AND CONTACT LENSES.
Claims use since June 1, 1945.

Ser. No. 491,640. GENERAL ANILINE & FILM CORPORATION, New York, N. Y. Filed Nov. 15, 1945.

PANDA

219,699. **BRAZO FLUX.** WELDING FLUXES. Registered Oct. 19, 1926. OXWELD ACETYLENE COMPANY. Renewed Oct. 19, 1946, to Union Carbide and Carbon Corporation, New York, N. Y., a corporation of New York. Class 6.

219,743. **"FRATELLI BERTI" ETC. AND DESIGN.** CANDY. Registered Oct. 26, 1926. BERTI BROTHERS, New York, N. Y. Renewed Oct. 26, 1946. Class 46.

219,746. **"PERMEX".** WRITING AND PRINTING INK IN PASTE FORM. Registered Oct. 26, 1926. THE AMERICAN CRAYON COMPANY, Sandusky, Ohio, a corporation of Ohio. Renewed Oct. 26, 1946. Class 11.

219,759. **BLOSSOM HILL.** FRESH DECIDUOUS FRUITS. Registered Oct. 26, 1926. ELIAS H. VOGEL, Lancaster, Pa. Renewed Oct. 26, 1946. Class 46.

219,779. **PROTEX.** HANDLE AND GUARD FOR PORTABLE ELECTRIC LAMPS. Registered Oct. 26, 1926. DANIEL WOODHEAD COMPANY, Chicago, Ill., a corporation of Illinois. Renewed Oct. 26, 1946. Class 21.

219,876. **REPRESENTATION OF A TOP.** KNITTED AND WOVEN FABRIC GLOVES WITH OR WITHOUT LEATHER FACING. Registered Oct. 26, 1926. WELLS-LAMONT MANUFACTURING CO., Minneapolis, Minn. Renewed Oct. 26, 1946, to Wells Lamont Corporation, Chicago, Ill., a corporation of Minnesota. Class 39.

219,894. **"OTIS" AND DESIGN.** ELEVATORS, ESCALATORS, ENDLESS CARRIERS, INCLINED RAILWAYS, BLAST-FURNACE HOISTS, AND GRAVITY SPIRAL CONVEYERS, AND PARTS THEREOF. Registered Oct. 26, 1926. OTIS ELEVATOR COMPANY, Jersey City, N. J., and New York, N. Y. Renewed Oct. 26, 1946, to Otis Elevator Company, New York, N. Y., a corporation of New Jersey. Class 23.

219,972. **HITS THE MARK.** STOCK FEED. Registered Oct. 26, 1926. A. E. STALEY MANUFACTURING COMPANY, Decatur, Ill., a corporation of Delaware. Renewed Oct. 26, 1946. Class 46.

219,987. **REPRESENTATION OF A FLYING BIRD.** CERTAIN ARTICLES OF FURNITURE. Registered Oct. 26, 1926. THE N. D. CASS CO., Athol, Mass., a corporation of Massachusetts. Renewed Oct. 26, 1946. Class 32.

220,019. **CELLU.** WASHED BRAN, BRAN WAFERS, BRAN BREAKFAST FOOD; INDIA GUM, AGAR-AGAR, AND MINERAL OIL USED AS FOOD INGREDIENTS; AGAR JELLY, GELATIN, COCOA NIBS, COCOA SHELLS, SOY CRISP, CANNED FRUITS AND VEGETABLES, AND FOOD FLAVORING EXTRACTS. Registered Oct. 26, 1926. THE CHICAGO DIETETIC SUPPLY HOUSE, INC., Chicago, Ill., a corporation of Illinois. Renewed Oct. 26, 1946. Class 46.

220,125. **MELOTEX.** ADVERTISING DISPLAY SIGNS AND ART PANELS AND PICTURES COMPRISING A DISPLAY SURFACE PROTECTED BY A COATING OF TRANSPARENT MATERIAL OTHER THAN GLASS. Registered Nov. 2, 1926. PYRAGLASS, INC., Newburgh, N. Y., a corporation of New York. Renewed Nov. 2, 1946. Class 50.

220,130. **GARDTOE.** LEATHER BOOTS AND SHOES. Registered Nov. 2, 1926. CHIPPEWA SHOE MANUFACTURING COMPANY. Renewed Nov. 2, 1946, to Chippewa Shoe Co., Chippewa Falls, Wis., a corporation of Wisconsin. Class 39.

220,133. **PREST-O-WELD.** ACETYLENE WELDING AND CUTTING APPARATUS AND PARTS THEREOF. Registered Nov. 2, 1926. OXWELD ACETYLENE COMPANY. Renewed Nov. 2, 1946, to Union Carbide and Carbon Corporation, New York, N. Y., a corporation of New York. Class 34.

220,190. **"WEBER" AND DESIGN.** ARTISTS' SCHOOL, AND SHOW-CARD COLORS IN TUBES, PANS, BOTTLES, JARS, POTS, AND CAKE AND STICK FORM; ARTISTS' OILS, VARNISHES, AND MEDIUMS, COMPOSED OF A MIXTURE OF OILS, VARNISHES, AND VOLATILES. Registered Nov. 2, 1926. F. WEBER CO., Philadelphia, Pa., a corporation of Pennsylvania. Renewed Nov. 2, 1946. Class 16.

220,196. **O-MODEL-O.** MODELING CLAY. Registered Nov. 2, 1926. THE AMERICAN CRAYON COMPANY, Sandusky, Ohio, a corporation of Ohio. Renewed Nov. 2, 1946. Class 1.

220,339. **REPRESENTATION OF AN EAGLE ON BARREL.** GASOLINE, KEROSENE, FUEL OIL, LUBRICATING OILS AND GREASES. Registered Nov. 9, 1926. NORTHERN IOWA OIL COMPANY, Cresco, Iowa, a firm. Renewed Nov. 9, 1946. Class 15.

220,380. **"HUMPTY DUMPTY" AND DRAWING.** COTTON PIECE GOODS. Registered Nov. 9, 1926. POMONA MILLS INC., Greensboro, N. C. Renewed Nov. 9, 1946, to Pomona Manufacturing Company, Pomona, N. C., a corporation of North Carolina. Class 42.

220,409. **"DEER HEAD" ETC. AND DESIGN.** WOOLEN PIECE GOODS. Registered Nov. 9, 1926. MADISON WOOLEN CO., Madison, Maine, a corporation of Maine. Renewed Nov. 9, 1946. Class 42.

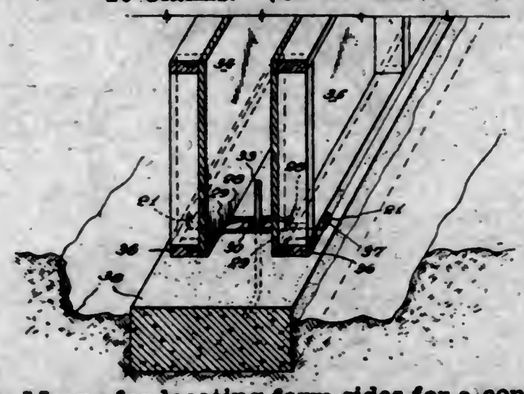
220,416. **MI-EMP.** WATCH GLASSES AND CRYSTALS. Registered Nov. 9, 1926. HAMMEL, RIGLANDER & CO. Renewed Nov. 9, 1946, to Hammel, Riglander & Co. Inc., New York, N. Y., a corporation of New York. Class 33.

220,447. **"CARECO" ETC. AND DESIGN.** FURNACE LININGS, FIRE BRICK, FACE BRICK, AND BAFFLE TILES. Registered Nov. 9, 1926. CAROLINA REFRACTORIES COMPANY, Hartsville, S. C., a corporation of South Carolina. Renewed Nov. 9, 1946. Class 12.

220,448. **"RUSCO" ETC. AND DESIGN.** ORE CONCENTRATION AND FLOTATION AGENT IN THE NATURE OF A CHEMICAL COMPOUND. Registered Nov. 9, 1926. THE RUBBER SERVICE LABORATORIES COMPANY, Akron, Ohio. Renewed Nov. 9, 1946, to Monsanto Chemical Company, St. Louis, Mo., a corporation of Delaware. Class 6.

220,453. **LADY VIRGINIA.** HOSIERY. Registered Nov. 9, 1926. S. H. KRESS & CO., New York, N. Y., a corporation of New York. Renewed Nov. 9, 1946. Class 39.

220,496. **SUNNY MOUNTAIN BRAND.** ORANGES, TANGERINES, GRAPEFRUIT, IN THEIR NATURAL STATE. Registered Nov. 9, 1926. SUNNY MOUNTAIN ORANGE CO., Riverside, Calif., a corporation of California. Renewed Nov. 9, 1946. Class 46.



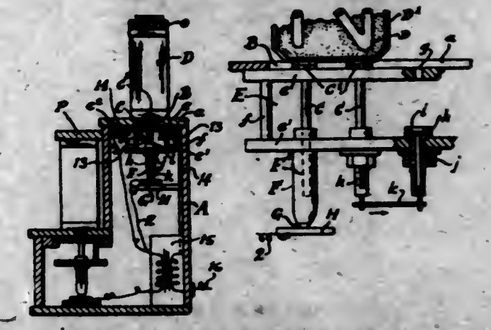
220,524. **WEST BAY.** CANNED FRUITS—NAMELY, CHERRIES AND APPLES. Registered Nov. 9, 1926. TRAVERSE CITY CANNING CO., Traverse City, Mich., a corporation of Michigan. Renewed Nov. 9, 1946. Class 46.

220,590. **UDYLITE.** TEST SETS AND TESTING EQUIPMENT FOR USE IN CADMIUM PLATING. Registered Nov. 9, 1926. UDYLITE PROCESS COMPANY, Kokomo, Ind. Renewed Nov. 9, 1946, to The Udylite Corporation, Detroit, Mich., a corporation of Delaware. Class 26.

REISSUES

OCTOBER 8, 1946

22,799
FORM ALIGNER
Warren Hyre, Clearwater, Fla.
Original No. 2,378,850, dated June 19, 1945, Serial No. 569,800, December 26, 1944. Application for reissue February 21, 1946, Serial No. 649,340
10 Claims. (Cl. 25—131)



1. Means for locating form sides for a concrete wall to be cast on a footing provided with dowel pins extending into the wall, comprising seats for the bottoms of the sides, means for connecting the seats, and means on the connecting means for engaging a dowel pin in a transversely adjusted position.

22,800
METHOD FOR THE CATALYTIC DEHYDROGENATION OF HYDROCARBONS
Kenneth K. Kearby, Cranford, N. J., assignor to Standard Oil Development Company, a corporation of Delaware
No Drawing. Original No. 2,370,797, dated March 6, 1945, Serial No. 456,266, August 26, 1942. Application for reissue July 19, 1946, Serial No. 684,763
5 Claims. (Cl. 260—669)

1. An improved method for the catalytic dehydrogenation of hydrocarbons selected from the class of mono-olefins and aralkyls having at least two carbon atoms in the alkyl group which comprises contacting said hydrocarbon diluted with from 1 to 30 volumes of steam per volume of hydrocarbon at temperatures between about 1000° F. and 1600° F. with a catalyst comprising a major portion of zinc oxide and a minor portion of an oxide selected from the class consisting of iron oxide, manganese oxide, cobalt oxide, nickel oxide and chromium oxide and a minor proportion of a promoter comprising potassium oxide.

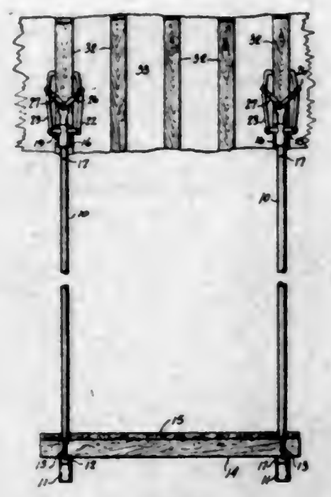
22,801
INTERCHANGEABLE LETTER SIGN
James R. Starnes, Toronto, Ontario, Canada, assignor, by mesne assignments, to Nusign Electric Limited
Original No. 2,295,188, dated September 8, 1942, Serial No. 332,412, April 29, 1940. Application for reissue September 7, 1944, Serial No. 553,100
2 Claims. (Cl. 40—130)

1. An interchangeable letter sign comprising a cabinet having an elongated opening formed through the top thereof, a lamp mounting fitted in said cabinet and positioned beneath said opening, a series of lamp sockets fitted in said mounting, a series of lamps formed in the shapes of letters comprising hermetically sealed tubes containing luminescent gas, adapted to be inserted and detachably engage in said sockets, a series of contacts depending from said mounting, contact plates set in said cabinet and engageable by said contacts, said mounting and contacts wired in circuit with an electrical source fitted in said cabinet, said lamp mounting adapted to be longitudinally adjusted to make and break the circuit connection with a portion of said lamp mounting and to center the display of lamps when varied on the said mounting numerically and permutably.

PLANT PATENTS

GRANTED OCTOBER 8, 1946

Owing to the fact that almost all of the illustrations of the plant patents are in colors, it is not practicable to print a cut of the drawing.

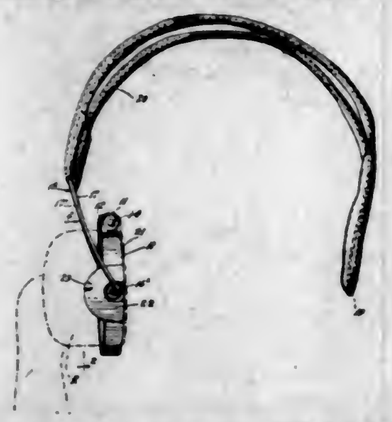


712
ROSE PLANT
Herbert C. Swim, Ontario, Calif., assignor to Armstrong Nurseries, Inc., Ontario, Calif., a corporation of California
Application December 18, 1945, Serial No. 635,663
1 Claim. (Cl. 47—61)

A new and distinct variety of rose plant of the polyantha class, characterized as to novelty by its loose and graceful habit of growth and development of large trusses of blooms, glossy foliage through which the bloom protrudes and thereby forms an attractive background for the flowers, the resistance to mildew of such foliage, the form, size, fragrance and color of the blooms, the large number of flowers per cluster and freedom of blooming, their freedom of the blooms from unsightly fading and their habit of dropping off cleanly, and the suitability of the plant generally for cut flowers and hedge purposes, substantially as shown and described.

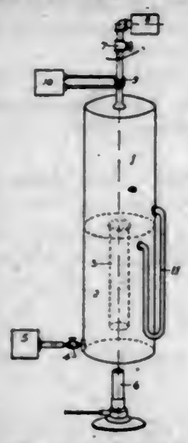
PATENTS

GRANTED OCTOBER 8, 1946



2,408,719
SUPPORT
Vardy M. Abernethy, Forest City, N. C.
Application October 1, 1945, Serial No. 619,545
1 Claim. (Cl. 304—19)

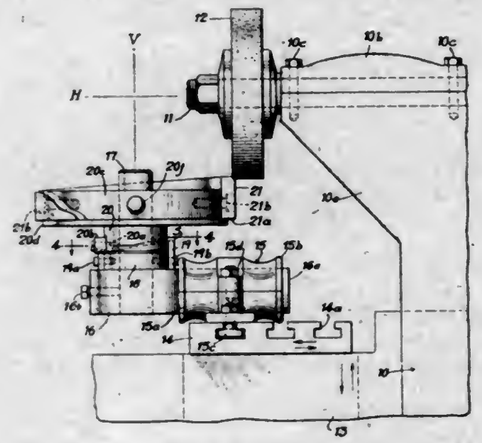
A support adapted to be secured to opposed sides of a rafter or other beam in a building comprising an elongated shank, means on the lower end of the shank for supporting an object, a sleeve slidably mounted near the upper end of the shank, a pair of dogs having their lower ends pivotally secured to opposed sides of the sleeve, a pair of links pivotally secured to the upper end of the shank at one end and having their other ends pivotally secured to an intermediate portion of said dogs, the upper ends of the dogs being turned inwardly and pointed towards each other and terminating in a sharp point and being adapted to engage and embed themselves in opposed sides of the beam when applied to a beam and downward pressure is applied to the shank, a stop on the shank to limit downward movement of the sleeve, said sleeve normally resting by gravity on said stop to cause the pointed ends of said dogs to be widely separated, lateral pressure on the shank serving to embed the pointed upper end of one of the dogs in one side of the rafter or beam so that a slight downward pull on the shank will move the pointed end of the other dog against the other side of the rafter or beam, and further downward pressure on the shank will embed the pointed ends of both dogs further in the rafter or beam.



2,408,720
ATTACHMENT FOR AUDIO RECEIVERS
Blandford A. Alger, Belleville, N. J.
Application May 28, 1945, Serial No. 596,349
1 Claim. (Cl. 179—156)

In an audio receiver attachment, a clamp, studs depending from said clamp, a headpiece provided with means engaging said studs to rotatably position said headpiece on said clamp, and cam means on said clamp adapted to be engaged by said

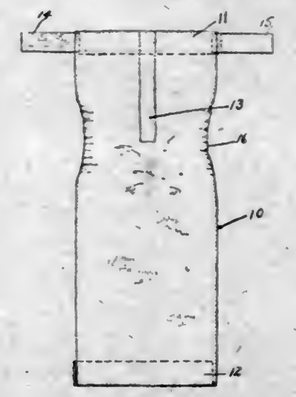
headpiece to fix the position of the latter on the clamp.



2,408,721
PNEUMATICALLY-OPERATED LIQUID-RECIRCULATING DEVICE
William B. Altsheler, Louisville, Ky., assignor to Joseph E. Seagram & Sons, Inc., Shively, Ky., a corporation of Indiana
Application July 1, 1944, Serial No. 543,159
4 Claims. (Cl. 23—252)

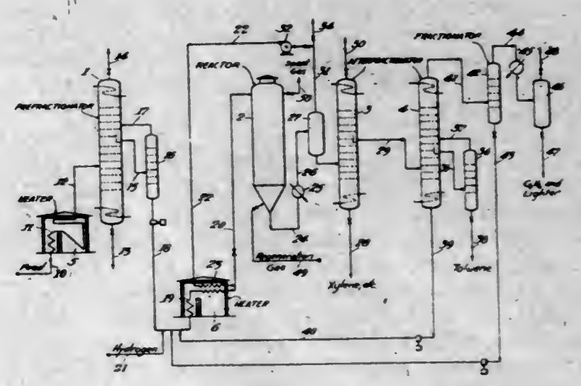
1. A pneumatically operated liquid recirculating device for gas absorbing, gas scrubbing and like purposes comprising: means providing an upper chamber; means providing a lower chamber adapted to receive an initial charge of liquid up to a predetermined upper level; a drain tube connecting the lower part of the upper chamber to the lower portion of the lower chamber; and a control tube, of small diameter in relation to the diameter of the drain tube, extending from the lower chamber adjacent its upper level downwardly to an intermediate elevation above the lower end of the drain tube and thence upwardly into the lower part of the upper chamber, said control tube also being adapted to receive liquid of said initial charge up to a level corresponding to said predetermined upper level; the upper part of said lower chamber being constructed and arranged to receive a progressive accumulation of gas in its upper portion to force said initial charge of liquid through the drain

and control tubes into the upper chamber as it simultaneously depresses the liquid level in both the lower chamber and the control tube whereby, when the depressed level reaches said intermediate elevation, the gas accumulation immediately becomes effective to flush the liquid remaining in the control tube upwardly into the upper chamber and to escape from the lower chamber through the control tube into the upper chamber thereby releasing the gas pressure in the lower chamber and permitting the liquid in the upper chamber automatically to gravitate rapidly back through said drain tube into the lower chamber and back into the control tube and thus recondition the device automatically for a repetition of its operation.



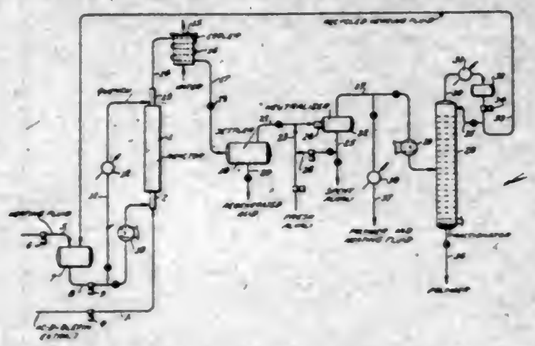
2,408,722
APPARATUS FOR FORMING CAM SURFACES UPON CYLINDRICAL CAM BODIES
Arthur Anderson, Brooklyn, N. Y.
Application April 7, 1945, Serial No. 587,126
1 Claim. (Cl. 51—101)

In apparatus comprising a rotatable grinding wheel for forming a cam surface wherein a work table is movable in a direction normal to the axis of said grinding wheel, said work table being adjustable longitudinally and transversely with respect to said axis, the combination with said apparatus of a detachable fixture including a base rigidly secured to said table and providing a vertically extending cylindrical portion constructed and arranged for the insertion thereover of a surrounding arcuate template, said base also providing a cylindrical bearing portion having a vertical axis of rotation coincident with the axis of said arcuate template, said detachable fixture also including a work carrier journaled on said base for movement radially and longitudinally of said vertical axis, said work carrier comprising a cylindrical portion concentric with said vertical axis for rigidly holding a cam body on the outer periphery thereof, and a template follower secured to said carrier for engagement with said template.



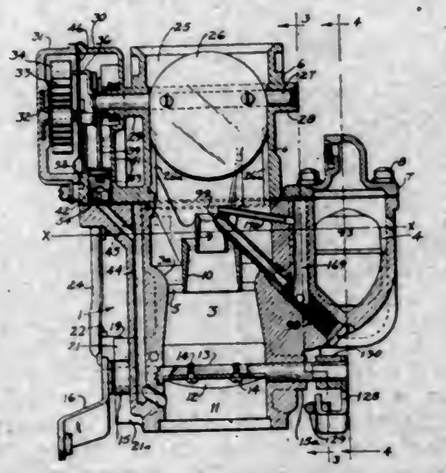
2,408,723
UNDERGARMENT
Leonard G. Arpin and Helen G. Arpin, Montclair, N. J.
Application March 19, 1945, Serial No. 583,632
3 Claims. (Cl. 2—224)

1. An undergarment comprising a unitary strip of fabric folded upon itself to form front and back members, the ends of said folded strip being interconnected to form waist engaging means, and a crotch portion formed on said front member, said crotch portion being defined by an area of said front member having pleated side edges whereby said pleated side edges are curved in-



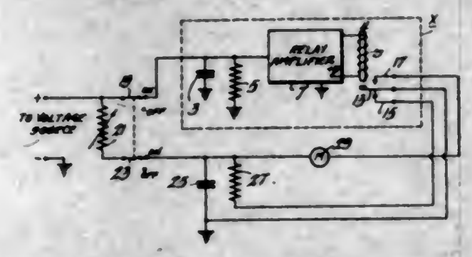
wardly in relation to the unpleated side edges of said front member so as to conform to the bottom torso curvature of a wearer, said pleated side edges forming said crotch portion of less width and greater fullness than the remainder of the undergarment.

2,408,724
TOLUENE PROCESS
James C. Ballie and Rodney V. Shankland, Chicago, Ill., assignors to Standard Oil Company, Chicago, Ill., a corporation of Indiana
Application August 7, 1942, Serial No. 453,929
7 Claims. (Cl. 260—668)



1. The process of making toluene in high concentration from petroleum naptha which comprises contacting said naptha at a conversion temperature within the range of about 850 to 1100° F. with a catalyst substantially free of alkali metals consisting essentially of alumina gel promoted with about 5 to 10 per cent of molybdenum oxide, the boiling range of said naptha lying within about 50° F. of the boiling point of toluene, supplying to the reaction zone about 1 to 5 mols of hydrogen per mol of naptha treated and recovering toluene from the reaction products, said alumina gel having been prepared by dissolving amalgamated metallic aluminum in a weak acid thereby forming an alumina sol, gelling said sol, drying and igniting the resulting alumina gel, and applying the molybdenum promoter to the gel subsequent to igniting by impregnating said gel with a solution of a soluble compound of molybdenum and re-igniting the catalyst.

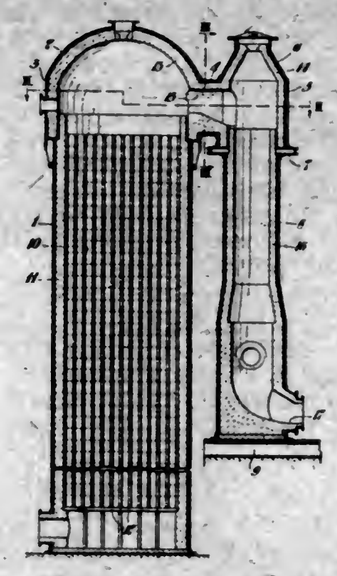
2,408,725
HYDROCARBON CONVERSION
Arnold Belchetz, Kew Gardens, N. Y., assignor to The M. W. Kellogg Company, Jersey City, N. J., a corporation of Delaware
Application September 4, 1942, Serial No. 457,530
15 Claims. (Cl. 260—683.15)



1. In the method of converting olefin hydrocarbons in which olefin hydrocarbons are absorbed in an acid polymerizing catalyst at temperatures below polymerizing temperatures and the extract thus obtained is heated under pressure to a temperature sufficiently high to polymerize the absorbed olefins in the liquid phase, the improvement which comprises mixing said extract while at a temperature below polymerizing temperatures and at the polymerizing pressure with hydrocarbon vapors comprising at least a substantial proportion of an isoparaffin hydrocarbon boiling above the polymerizing temperature at the polymerizing pressure in proportions which produce a resulting mixture of extract and condensed vapors which is at the desired polymerizing temperature, separating from the resulting polymerized product regenerated acid catalyst and a hydrocarbon mixture comprising the polymers and the isoparaffin hydrocarbon, recycling said regenerated acid catalyst to said absorption step, and subjecting said hydrocarbon mixture comprising olefin polymers and the isoparaffin hydrocarbon to alkylation reaction conditions.

2,408,726
CARBURETOR
George M. Bicknell, St. Louis, Mo., assignor to Carter Carburetor Corporation, St. Louis, Mo., a corporation of Delaware
Application November 5, 1942, Serial No. 464,643, which is a division of application Serial No. 333,759, May 7, 1940. Divided and this application September 6, 1943, Serial No. 501,437
6 Claims. (Cl. 261—69)

1. In a carburetor, a mixture conduit, a main fuel passage, a constant level fuel chamber having a lateral extension below the fuel level and opening through the side wall of said chamber, a diaphragm closing said opening and acting against the fluid in said chamber, a plate fixed over said diaphragm and forming a suction chamber therewith, said plate having an opening axial of the center of said diaphragm, a suction passage connecting said conduit and said chamber, a metering orifice in said main fuel passage, a metering pin for regulating the fuel passing through said orifice, said metering pin extending axially through said orifice, diaphragm, and plate opening, and means removable through said plate opening and securing said metering pin to said diaphragm whereby movement of said diaphragm by suction regulates the flow of fuel through said jet.

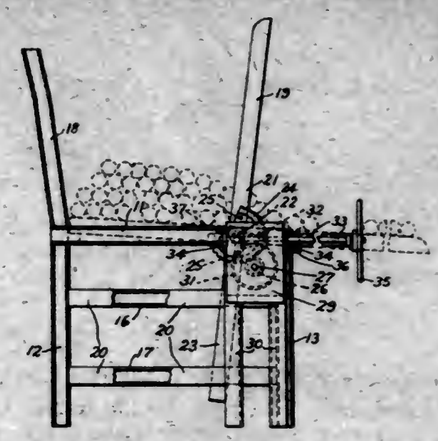


2,408,727
MEANS FOR CIRCUIT TIME CONSTANT MEASUREMENT
Daniel Blitz, Princeton, N. J., assignor to Radio Corporation of America, a corporation of Delaware
Application July 11, 1944, Serial No. 544,448
8 Claims. (Cl. 161—15)

1. Apparatus for measuring the time constant of an electrical network comprising a capacitor, connection means for a source of charging potential, means for selectively applying said potential to and for simultaneously removing said potential from said network and said capacitor, a discharge circuit for said capacitor, means selectively connected in shunt with said capacitor for indicating the electrical charge on said capacitor, and switching means responsive to the removal of said potential from said network for selectively disconnecting said discharge circuit from and for alternately connecting said indicating means to said capacitor to indicate said network time constant as a function of the residual charge on said capacitor.

2,408,728
HOT-BLAST STOVE
Andrew Bowland, Mount Lebanon, Pa., assignor to William M. Bailey Company, a corporation of Pennsylvania
Application August 3, 1942, Serial No. 453,353
3 Claims. (Cl. 263—19)

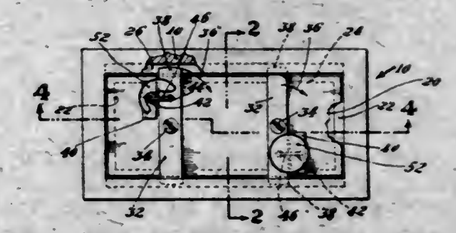
1. In a hot blast stove comprising an insulating wall having checker tile mounted therein and having a sheet metal housing spaced from the outer wall thereof, a combustion chamber spaced from said checker tile structure having an insulating wall and a sheet metal lining spaced from the outer wall thereof, domes mounted on the respective checkerwork and combustion chamber structures having communicating ducts laterally spaced to deliver the products of combustion from the combustion chamber over substantially the entire area above the checker tile, said ducts being of a greater horizontal cross-sectional area than the dome above the combustion chamber, said domes and ducts having a sheet metal outer housing connected to the housing of the combustion chamber by a thermal expansion joint whereby the duct connected domes are vertically



movable as a unit in response to thermal expansion of the checkerwork wall.

2,408,729
CUTTING MACHINE
Jesse W. Brackett, New Bedford, Mass.
Application April 14, 1944, Serial No. 531,015
5 Claims. (Cl. 107—12)

1. In a machine as described, the combination of means for intermittently advancing a body of plastic material, means for pressing the material into a slab of predetermined thickness, a knife comprising a straight blade and an angular blade element attached thereto, means for imparting lateral movement to successive strips cut from the material by said straight blade to bring successive strips underneath the angular blade element to be cut into pieces of predetermined size, means for actuating the knife, and means for actuating said advancing means in timed sequence with said knife.

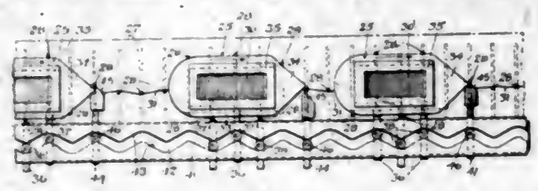


2,408,730
STOCK SUPPORTING TABLE
Jack Breslav, New Haven, Conn.
Application March 22, 1944, Serial No. 527,591
7 Claims. (Cl. 214—16)

1. In a stock supporting table, a stock supporting base, a first upright side member at one side of said base, a second straight and upright side member at the other side of said base, said second member being pivoted intermediate its ends to position its end portions, when swung on its pivot, inclined in respect to said base, with one end portion extending beyond said other side of said base and with the other end portion between the sides of the base and forming an inclined supplemental

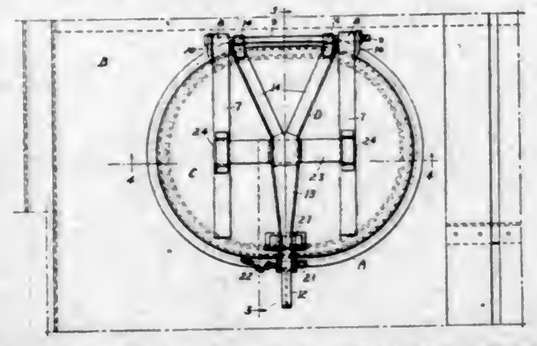
base to tilt the load and facilitate its removal from said base.

2,408,731
CONTAINER OR SHIPPING CASE HAVING A REMOVABLE COVER TO BE LOCKED AND SEALED
Joseph Burger, New York, N. Y.
Application December 30, 1943, Serial No. 516,151
1 Claim. (Cl. 217—56)



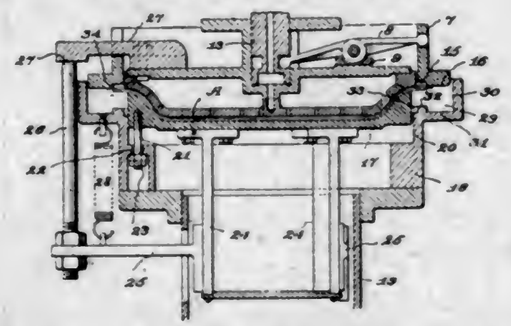
A shipping case comprising a bottom, end walls, side walls and a removable closure therefor, said side walls having grooves therein, locking members pivotally secured to the closure, stop members fixed to the closure and extending substantially at right angles to the grooves upon arranging the closure in the case, each of said locking members to be swung about its pivot into locking position against a stop member with the ends of the locking member inserted in a said groove, each of said stop and locking members having holes therein, the mouth of the hole in a stop member lying in the same horizontal line as the mouth of the hole in the locking member upon bringing the locking member against a stop member, a U-shaped member, the legs of which completely and removably extend into a hole in the stop member and into the hole of the corresponding locking member, the element of said U-shaped member connecting the legs thereof being positioned on and against the top of the stop member and corresponding locking member and a flat sealing member secured to the surface of the stop member and corresponding locking member and extending partially thereover to partially cover said members, the holes and leg joining element of the U-shaped member.

2,408,732
CIRCULAR LOOM
Constantine A. Caldes, Jersey City, N. J.
Application December 16, 1944, Serial No. 568,481
14 Claims. (Cl. 139—15)



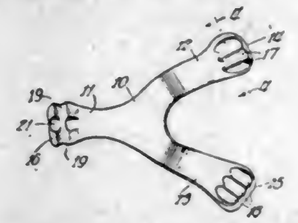
1. In a circular loom, a shuttle, a stator to guide the shuttle, a rotor, shuttle driving members arranged on said rotor in relation to said shuttle

for movement into and out of engagement with the shuttle while traveling with said rotor to drive



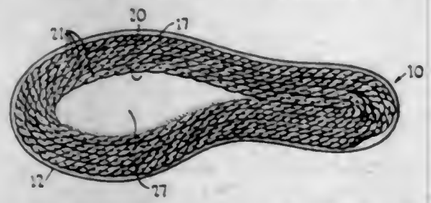
the shuttle and enabling warp threads to pass between the shuttle and the rotor, and means to operate the driving members.

2,408,733
ROOF HATCH FOR RAILWAY CARS
Argyle Campbell, Chicago, Ill., assignor to Enterprise Railway Equipment Company, Chicago, Ill., a corporation of Illinois
Application August 4, 1944, Serial No. 548,079
6 Claims. (Cl. 105—377)



1. In a roof hatch of the class described, the combination of a hatch wall defining a hatch opening and having a seat on its upper margin, a pan-shaped cover hinged on said hatch wall and adapted to be pressed upon said seat, an operating mechanism bridging the cover and hinged at one side adjacent the cover hinge, means at the other side of said operating mechanism for holding said operating mechanism in closed position, and a resilient means carried by said operating mechanism and bearing upon said cover to apply pressure to hold the cover upon its seat.

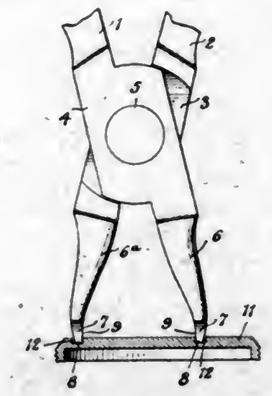
2,408,734
MOLDED FIBER EDGE FORMING APPARATUS
Merle P. Chaplin, South Portland, Maine
Application September 13, 1944, Serial No. 553,904
12 Claims. (Cl. 92—56)



1. An apparatus of the character described comprising a pair of coacting coaxial dies adapted to engage the opposite faces of a molded fiber article interposed between them with the marginal portion of the article extending beyond the opposing article engaging surfaces of both dies, a stationary member surrounding one of the dies and provided therein with a molding channel, a shaping ring embracing the other die with its inner periphery alined with the outer periphery of the molding channel, said ring being axially movable with respect thereto to deflect the extending marginal portion of the article toward and into axial alinement with the said channel and thereafter form a wall about the outer periphery of said channel, and means for axially moving both dies in the direction of the base of the molding channel to compress and compact said deflected marginal portion of the article in said molding channel.

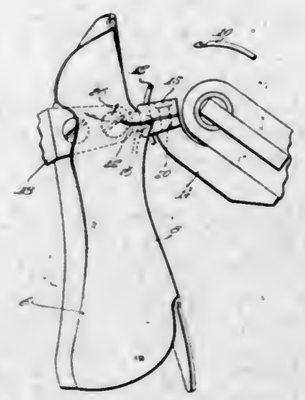
2,408,735
TEETHING DEVICE
Roland S. Claflin, Park Ridge, Ill.
Application March 20, 1943, Serial No. 479,837
5 Claims. (Cl. 128—359)

1. A teething device for infants, comprising a central body portion and three diverging curved prongs, the curve in each prong being intermediate the central body and the end portion thereof and the concave side of one prong being faced in the opposite direction from that of another of the prongs whereby to hold the body of the device raised on a plane surface in substantially all positions of the device.



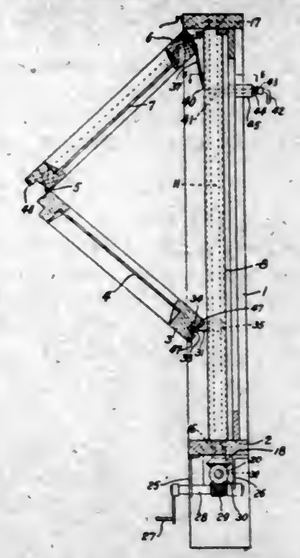
2,408,736
SOLE FOR SHOES, SLIPPERS, OR OTHER ARTICLES OF FOOTWEAR
George Codish, New York, N. Y.
Application March 29, 1944, Serial No. 528,563
7 Claims. (Cl. 36—30)

1. A sole comprising a sole shaped board, a cord contacting the underside of the board and wound continuously around one face of the board and covering all but the central portion of the ball of said board, and being stitched to said board by stitching extending longitudinally of the cord, and an insert at said central portion of the ball of the board, said insert comprising a filler contacting the underside of said board and disposed within said central portion of the ball of the board, and a covering for said filler, the edge portion of said cover being tucked beneath the wound cord and stitched to the board by the stitching which stitches the cord to said board.



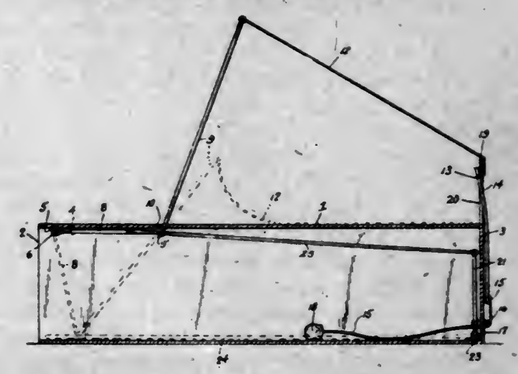
2,408,737
WATCHCASE TOOL
Louis A. Cormier, West Hempstead, N. Y., assignor to Hammel, Riglander & Co. Inc., New York, N. Y., a corporation of New York
Application March 27, 1945, Serial No. 585,057
2 Claims. (Cl. 81—6)

1. A tool for removing thread-on backs of watch cases comprising, a pair of pliers having jaws tapered and inturned toward one another and shaped at their ends to enable the same to be engaged in a pair of spaced recesses in the back of a watch case and the tool rotated to



thereby unthread the back of the watch case, the ends of the jaws being of rectangular form and being notched in the sides which face toward one another.

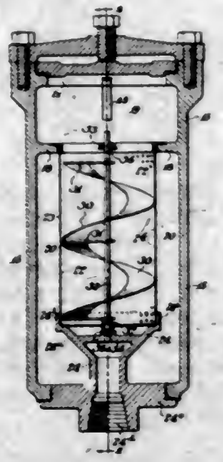
2,408,738
MOCCASIN SEWING MACHINE
William A. Crawford, Mattoon, Ill., assignor to United Shoe Machinery Corporation, Flemington, N. J., a corporation of New Jersey
Application June 14, 1945, Serial No. 599,473
2 Claims. (Cl. 112—60)



1. A machine for sewing a U-shaped moccasin seam in a one-piece shoe upper, having a work support provided with work engaging surfaces disposed with relation to each other and extending in the direction of work feed to form a re-entrant angle, an internal presser formed with angularly disposed work engaging surfaces to force the upper into the angle between the work engaging surfaces of the work support, and stitch forming and work feeding devices including a needle moving in a path intersecting the material of the upper along that portion within the angle of the work engaging surfaces on the work support and acting progressively along the line of the seam to form a permanent fold in the upper, in combination with a finger engaging the upper along the line of the fold in advance of the point of entry of the upper between the work engaging surfaces of the work support, to deflect a portion of the upper outside the seam line and to bring that portion of the upper into general conformity with the angle of the work engaging surfaces of the work support as the upper is fed.

2,408,739
WINDOW CONSTRUCTION
Rodney Dawes, Royal Oak, Mich.
Application November 3, 1943, Serial No. 509,001
20 Claims. (Cl. 160—188)

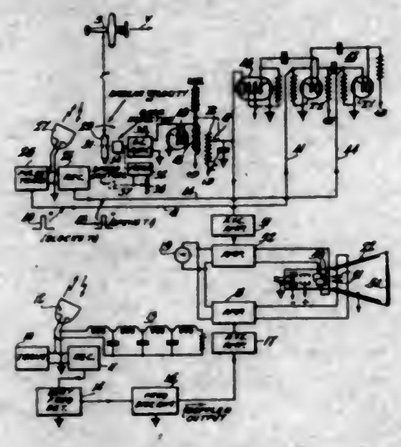
1. A window construction comprising a rectangular frame having a single sash guideway, aligned lower and upper sashes pivotally joined by an intermediate hinge, pivotal means supporting the upper sash within said frame, aligned pivotal means supporting the lower sash within said frame, and rotatable means vertically disposed and journaled within said frame operatively engaged by said lower sash pivotal means for vertical adjustments.



2,408,740
ANIMAL TRAP
Paul De Asis, New York, N. Y.
Application June 8, 1944, Serial No. 539,309
8 Claims. (Cl. 43—61)

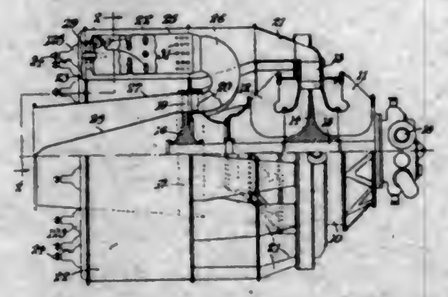
1. A trap comprising a housing open at its front end and having a top formed with a transverse slot spaced from its front end and a rear end wall formed with an opening near its lower end, a striker pivotally mounted in the rear portion of said housing and urged downwardly, a yoke pivotally mounted adjacent the open front end of said housing and urged downwardly, a plate pivoted to the inner rear end of said yoke and extending upwardly through the slot in the top of the housing, a strip extending longitudinally in said housing and having its rear end pivoted to the upper end of said striker and its front end pivoted to the lower end of said plate, a panel extending upwardly across the rear end of said housing and formed with a vertically extending opening intermediate its width, a bait-holding line passing through the opening in the rear wall of said housing with its inner portion extending

longitudinally in the housing for carrying bait, a rod carried by the rear end of said line and disposed vertically in set position with its upper end portion passing through the opening of the panel and bearing against the front face of the panel above the opening thereof, and a line secured at the upper end of said plate and extending rearwardly of the housing with its rear end passing downwardly and forwardly through the opening of the panel and terminating in an eye for engaging about the upper portion of said rod.



2,408,741
SELF-CLEANING STRAINING DEVICE
William R. Dodge, Aldan, Pa., assignor to Hajoca Corporation, a corporation of Delaware
Application August 11, 1944, Serial No. 548,988
1 Claim. (Cl. 210—167)

In a filtering device, the combination of a casing open at the top and bottom and provided at its upper portion with an annular, lateral, inwardly projecting flange, a hollow plug member closing the lower end of the casing and provided with an upwardly extending inverted conical portion and having an outlet for solids, a perforated open ended cylindrical basket arranged within the casing and spaced from the walls thereof and seated upon said conical portion having its upper end arranged within the annulus defined by said inwardly projecting flange, cross bars provided with bearings and located in said conical portion and in the top of the basket, a shaft journaled in said bearings, a helical blade mounted on said shaft in close proximity to said basket for rotation and for shearing material projecting from the interior of the basket wall, an inlet in line with the upper open end of the basket and an outlet located at the top of the casing and communicating with the space between the casing and the basket.

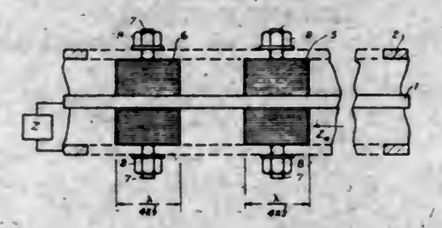


2,408,742
RADIO SYSTEM FOR VELOCITY MEASUREMENT
Thomas T. Eaton, Haddon Heights, N. J., assignor to Radio Corporation of America, a corporation of Delaware
Application December 11, 1942, Serial No. 468,868
5 Claims. (Cl. 250—1)

1. In combination in a system for determining that component of an object's velocity which is at right angles to the line of sight from the observer to the object, an object locating means which has a line of sight axis and which is rotatably mounted about an axis perpendicular to said line of sight axis, means for producing an electrical quantity that is representative of the distance from the observer to the object, means for positioning said object locating means with its mounting axis perpendicular to the plane defined by the line of motion of said object and by the line of sight from the observer to the object whereby the object locating means may be turned in said plane about said mounting axis at such

an angular velocity as to keep said line of sight axis pointed toward said object, means responsive to said turning of the object locating means for obtaining an electrical quantity that is representative of said angular velocity, and means for multiplying said two electrical quantities to obtain a product which is equal to said desired velocity component.

2,408,743
JET-PROPULSION APPARATUS FOR AIRCRAFT
Albert George Elliott, Quarndon, Derby, England
Application October 7, 1943, Serial No. 505,394
In Great Britain May 18, 1942
1 Claim. (Cl. 60—35.6)

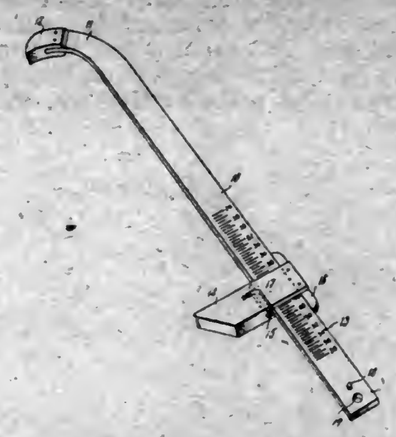


A jet-propulsion apparatus for aircraft, comprising a central air-compressor, a gas-turbine co-axial with, and to the rear of the compressor and coupled to the compressor to drive it, a gas outlet co-axial with and to the rear of the turbine and the compressor, through which outlet gases passing through the turbine are discharged rearwardly as a jet propelling the aircraft, a single annular chamber closed at its rear end and surrounding the jet outlet co-axially therewith, at least one passage through which air under pressure is delivered by the compressor to the front end of the annular chamber, a number of cylindrical open-ended combustion chambers mounted in the annular chamber in closely spaced side by side relationship with their axes equally spaced and parallel with the axis of the turbine and compressor, a fuel-injection nozzle for each combustion chamber arranged to direct the fuel forwardly into its combustion chamber and ducts

for conveying the products of combustion from the front ends of the combustion chambers through the turbine, to drive it, and hence to the jet outlet from which they are discharged.

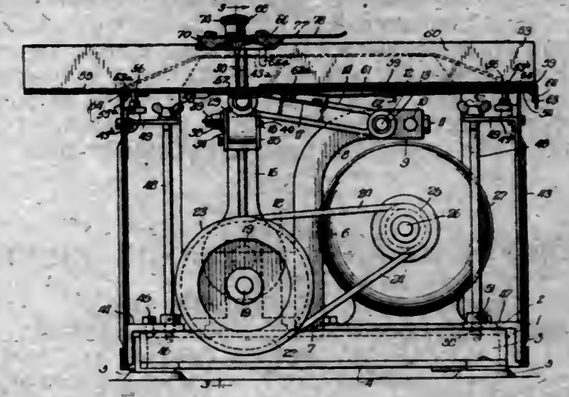
2,408,744
PROCESS OF PRODUCING ESTERS
Karl H. Engel, Teaneck, N. J., assignor to Allied Chemical & Dye Corporation, New York, N. Y., a corporation of New York
No Drawing. Application April 11, 1945, Serial No. 587,827
8 Claims. (Cl. 260—461)

1. The process of making esters of phosphorous acid which comprises reacting a compound selected from the group consisting of alcohols and phenols with phosphorus trichloride in the presence of an organic base having a tertiary nitrogen atom which reacts with the hydrogen chloride liberated during the reaction to form a hydrochloride having a melting point not above 110° C. and separating the hydrochloride in the liquid phase from the ester at a temperature above the melting point of the hydrochloride.



2,408,745
VARIABLE IMPEDANCE TRANSFORMER
Dennis Clark Espley, North Wembley, England, assignor to The General Electric Company Limited, London, England
Application November 10, 1942, Serial No. 465,143
In Great Britain November 11, 1941
13 Claims. (Cl. 178—44)

1. A variable impedance transformer of the type in which part at least of the impedance transformation is effected in a transmission line comprising, a transmission line having a first pair of terminals adapted to have coupled thereto an impedance of a first value and having a second pair of terminals at which it is desired that said first value of impedance be transformed by said line to a second value of impedance, and modifying means readily slidable along said transmission line in the operative condition thereof to modify the characteristic impedance of at least two substantial parts of said line which parts have positions along said line selectable by movement of said modifying means.

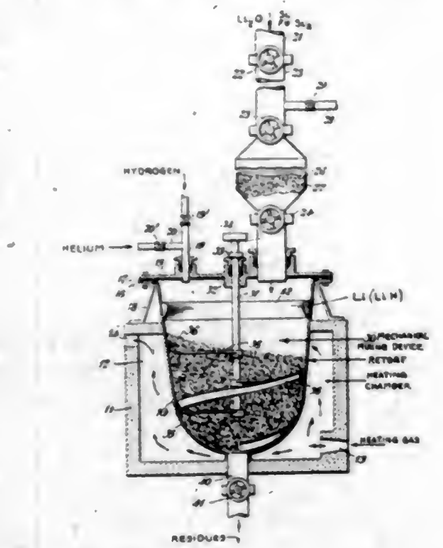


2,408,746
APPARATUS FOR MEASURING TIRES
Ralph W. Evert, Detroit, Mich., assignor to United States Rubber Company, New York, N. Y., a corporation of New Jersey
Application March 21, 1945, Serial No. 583,871
1 Claim. (Cl. 33—178)

A tire measuring device for determining the diameter of the tread of a tire in the plane of the wheel, comprising a graduated bar adapted to rest with one edge tangent to the tire tread in surface contact therewith and having a fixed lateral projection from said edge at one end that is provided with a tire contact point for engaging the tire tread and a movable lateral projection slidably mounted on the bar near its other end and having a tire contact point, the slidably mounted projection being adapted to slide along the bar until its contact point en-

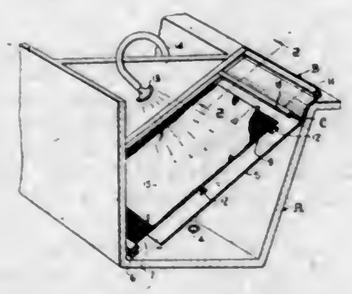
gages the tire tread, whereupon when the said edge and two points engage the tire the diameter of the tire tread can be determined by reading the position of the sliding projection relative to said graduations.

2,408,747
MEAT TENDERING MACHINE
Arthur H. Ahrndt, La Porte, Ind., assignor to U. S. Slicing Machine Company, La Porte, Ind., a corporation of Indiana
Application May 14, 1941, Serial No. 393,381
17 Claims. (Cl. 17—25)



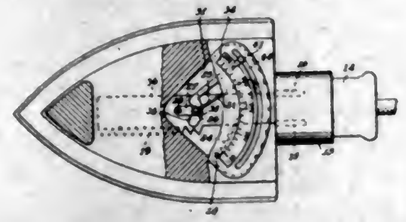
1. A machine having a relatively low base, tendering mechanism including a plurality of tines supported on the base and extending upwardly therefrom, a housing about said mechanism, a trough removably mounted on a top portion of said housing, and means removably fastening the housing to the base, said means comprising elongated members extending downwardly from adjacent said top portion of the housing so as to be readily accessible upon removal of said trough, said members having threaded ends and impinging portions engageable with the base and housing to removably lock the housing to the base.

2,408,748
PRODUCTION OF LITHIUM HYDRIDE
Peter P. Alexander, Marblehead, Mass., assignor to Metal Hydrides Incorporated, Beverly, Mass., a corporation of Massachusetts
Application September 30, 1944, Serial No. 556,578
21 Claims. (Cl. 23—204)



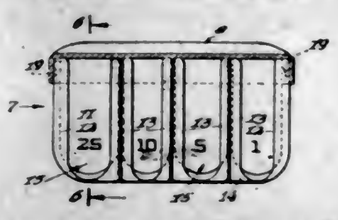
16. In the method of producing lithium hydride, the improvement which comprises confin-

ing a charge of lithium oxide and silicon-bearing material in a reaction zone, subjecting the charge and reaction zone to a vacuum to remove objectionable air and moisture, admitting inert gas to the reaction zone in amount sufficient to place it under substantial positive pressure, heating the charge to a temperature sufficiently high to reduce the lithium oxide and to distill the resulting metallic lithium, intimately



admixing the charge while the reduction of the lithium oxide and the distillation of the resulting metallic lithium take place to insure contact of the silicon-bearing material with particles of unreduced lithium oxide, condensing the distilled lithium in a cooler portion of the reaction zone removed from the charge, admitting hydrogen gas to the reaction zone, and converting the condensed lithium by reaction with the hydrogen in the presence of the inert gas to lithium hydride.

2,408,749
MEANS FOR WASHING AND DRYING FABRIC ARTICLES
Floyd H. Berg, Minneapolis, Minn.
Application May 10, 1944, Serial No. 535,006
2 Claims. (Cl. 68—205)

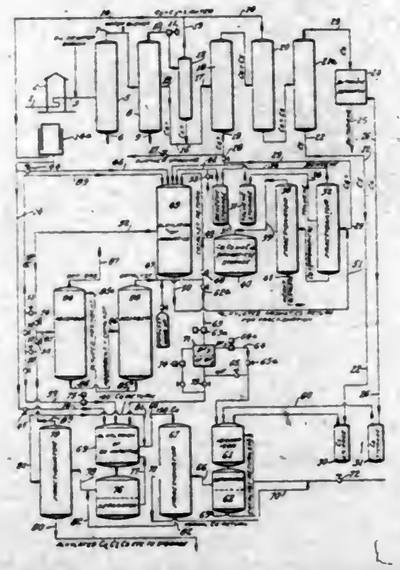


1. In a washing and drying device a rectangular frame, a rectangular screen stretched over the frame opening and attached at three side edges to three sides of the frame, the fourth edge of the screen being spaced from the fourth side of the frame to provide an edge over which an end edge portion of a flat fabric article may be folded with the main body portion of the article in surface contact with one face of the screen, said fourth edge of the screen being raw cut whereby wire ends will project to engage the fold line of the article folded thereover.

2,408,750
TEMPERATURE INDICATING ELECTRIC IRON
Leo Roman Bolte, Staten Island, N. Y.
Application March 6, 1943, Serial No. 478,223
1 Claim. (Cl. 219—25)

A temperature indicating device for an electrically heated appliance, said appliance including a body portion having a cavity with electrical heating means in said cavity and a cover plate on said body portion over said cavity, said device comprising a dial having a curved slot fixed to said cover plate, a substantially U-shaped thermoresponsive element in said cavity, said element having one leg of the U pivoted to the cover plate, a vertical shaft journalled in the cover plate, a short arm fixed to said shaft below the plate, the other leg of the U-shaped element pivoted at its end to said short arm, a pointer fixed to said vertical shaft, a member slidable in the slot of said dial, said slidable member having a terminal in said body cavity connected to said heating means, said terminal adapted to contact said short arm.

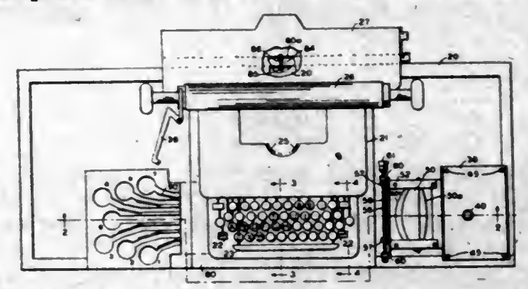
2,408,751
CHANGE PURSE
Harold Breiter, New York, and Harold Brandon, Brooklyn, N. Y.
Application November 30, 1944, Serial No. 565,850
2 Claims. (Cl. 133—6)



1. A change purse comprising a body portion and a cap, said body portion comprising a back portion and ribs extending laterally therefrom and defining coin channels formed between said ribs, said ribs comprising end ribs and intermediate concave ribs, the end ribs having recesses therein said concave ribs comprising convex exterior surfaces whereby grooves are formed in said body exteriorly of each two adjacent concave ribs, said cap comprising knobs formed therein corresponding in location to said recesses and adapted to compress said concave ribs inwardly when said cap is put in place on said body portion, and means on said cap for engaging the end rib recesses for locking said cap to the body portion.

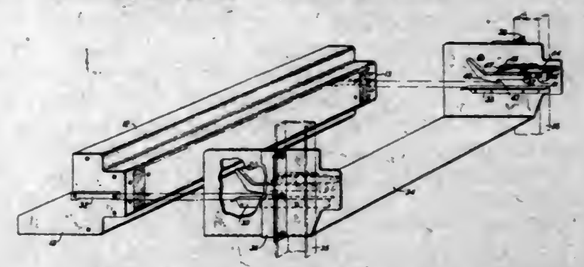
2,408,752
PREPARATION OF BRANCHED CHAIN HYDROCARBONS
Robert E. Burk, Cleveland Heights, Ohio, assignor to The Standard Oil Company, Cleveland, Ohio, a corporation of Ohio
No Drawing. Application April 18, 1942, Serial No. 439,543
2 Claims. (Cl. 260—683.5)

1. A process for converting normal to slightly branched hydrocarbons to highly branched isomers by a unitary two-stage process, which comprises subjecting hydrocarbons having 5 to 8 carbon atoms—closely fractionated to contain primarily normal to slightly branched paraffinic hydrocarbons of the same number of carbon atoms—to isomerization with a halide catalyst at a temperature below ordinary temperature to form isomers slightly more branched than said starting hydrocarbons, separating the so-formed slightly branched isomers from the remaining hydrocarbons and subjecting said separated isomers to further isomerization with a halide catalyst at a temperature below ordinary temperature to form more highly branched isomers.



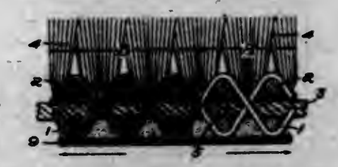
2,408,753
TREATMENT OF HYDROCARBONS
Robert E. Burk, Cleveland Heights, Ohio, assignor to The Standard Oil Company, Cleveland, Ohio, a corporation of Ohio
Application June 22, 1943, Serial No. 491,755
8 Claims. (Cl. 260—671)

1. The process which comprises heating hydrocarbons to a relatively high temperature for a short time to form ethylene and propylene, C_4 and C_5 aliphatic hydrocarbons, and aromatics, separating the C_3 and lighter hydrocarbons containing propylene and ethylene, an aliphatic fraction selected from the group consisting of C_4 hydrocarbons, C_5 hydrocarbons and a mixture thereof and comprising a normal paraffinic hydrocarbon, and a C_6 and heavier hydrocarbon fraction containing aromatics; introducing the propylene and ethylene containing fraction and the aromatics into an alkylation zone and reacting the propylene with at least a part of the aromatics, isomerizing at least part of the normal paraffinic hydrocarbon in the aliphatic fraction, transferring the ethylene from the first alkylation zone and alkylating the isomerized hydrocarbon with the ethylene.



2,408,754
PHOTOELECTRIC TRANSMITTING TYPEWRITER APPARATUS
George L. Bush, Flushing, N. Y., assignor to The Teleregister Corporation, New York, N. Y., a corporation of Delaware
Application July 27, 1944, Serial No. 546,832
17 Claims. (Cl. 178—79)

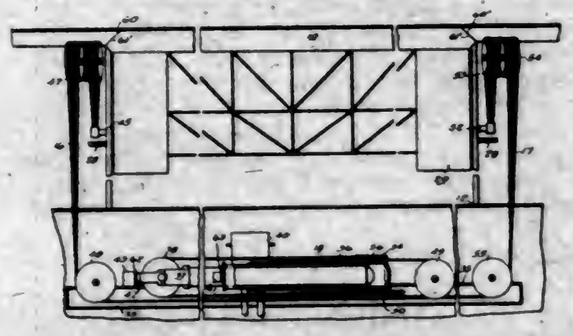
1. Photoelectric typewriter apparatus for transmitting permutation code signals having marking and spacing codal elements, comprising a typewriter keyboard having an assembly of character key levers, a plurality of photocells respectively corresponding to the codal elements of the permutation signals, means for producing separate light beams passing transversely across said key levers and respectively associated with said photocells for selectively activating the



same, coded light shutters projecting from the key levers whereby when a key lever is actuated the light beams are permutably interrupted depending upon the character represented by said key lever, and a plurality of signal generating devices respectively controlled by said photocells for producing marking or spacing pulses depending upon which of said photocells are activated by said light beams.

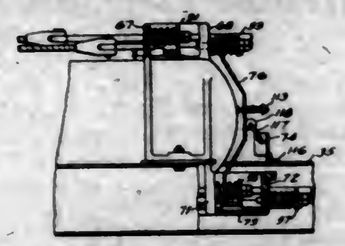
2,408,755
LATCHING MECHANISM
Harold D. Cahill, Scarsdale, N. Y., assignor to Bell Telephone Laboratories, Incorporated, New York, N. Y., a corporation of New York
Application September 22, 1944, Serial No. 555,358
10 Claims. (Cl. 248—361)

1. In combination, an apparatus mounting tray, an apparatus unit having a home position on said tray, a manually operable latch for locking said unit in its home position in said tray, and means coupled to and controlled by said latch when manually operated to an unlatching position for ejecting said unit from its home position on said tray.



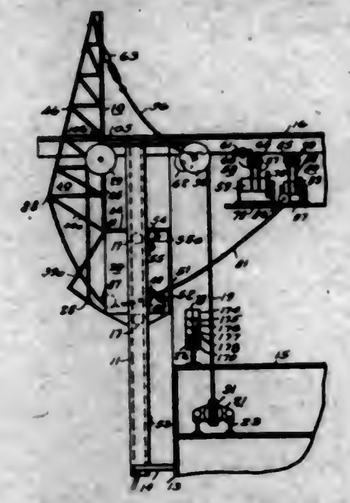
2,408,756
PILE FABRIC MANUFACTURE
James N. Dow, Longmeadow, Mass., and Ara T. Dildilian, Suffield, Conn., assignors to Bigelow-Sanford Carpet Co., Inc., Thompsonville, Conn., a corporation of Massachusetts
Application April 9, 1941, Serial No. 387,694
14 Claims. (Cl. 154—2)

1. The method of manufacturing a pile fabric of extensive area from assembled smaller pieces of fabric which consists in fray proofing the fab-



ric by embedding the tufts of the pile loops in a thermoplastic adhesive having a softening point of between 85° C. and 140° C. and composed chiefly of vinyl resin, cutting the pile fabric so fray proofed, assembling a plurality of pieces of the fabric so cut with their cut edges in abutting relation, and securing the abutting edges together with a tape carrying a thermoplastic adhesive composed chiefly of a copolymer of vinyl acetate and vinyl chloride.

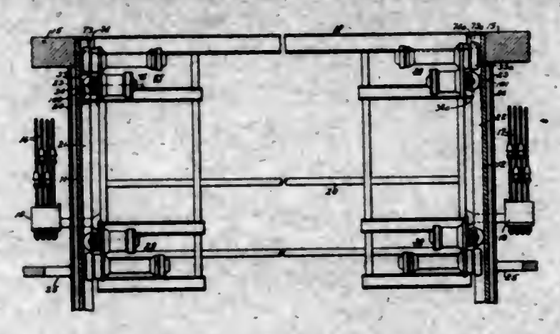
2,408,757
ELEVATOR
James Dunlop, Ridgewood, N. J., assignor, by mesne assignments, to Westinghouse Electric Corporation, East Pittsburgh, Pa., a corporation of Pennsylvania
Application October 21, 1943, Serial No. 507,132
7 Claims. (Cl. 187—6)



5. An elevator operable between an upper level and a lower level comprising a platform movable on guides, a hydraulic engine having a cylinder and a power plunger therein for operation by hydraulic pressure, a plurality of power sheaves mounted on the outer end of the plunger, two sets of hoisting cables fastened to said platform at opposite sides and extending over the sheaves on the plunger to opposite sides of the cylinder of the engine, a stopping device for said platform at its upper level, and an adjustable stop for stopping the plunger when it moves forward to a position slightly beyond its position corresponding to the upper level position of the platform, whereby a predetermined tension is produced in said hoisting cables when said platform is at floor level in its upper level position.

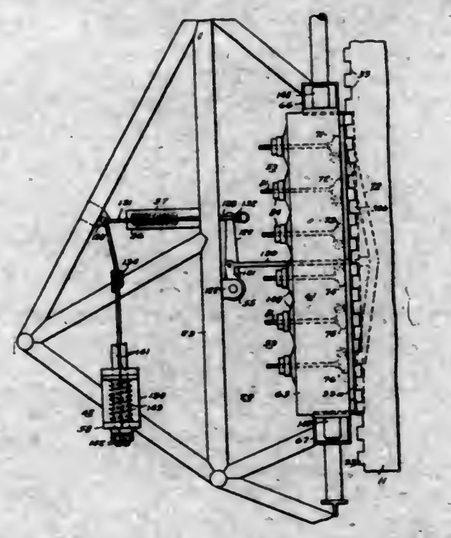
2,408,758
SAFETY APPARATUS FOR ELEVATORS
James Dunlop, Ridgewood, N. J., assignor, by mesne assignments, to Westinghouse Electric Corporation, East Pittsburgh, Pa., a corporation of Pennsylvania
Application October 29, 1943, Serial No. 508,191
7 Claims. (Cl. 187—29)

1. In an elevator, a plotform for serving a lower floor and an upper floor, a plurality of hoisting cables for raising and lowering the platform, an engine for operating the hoisting cables, a hitch box, a hitch rod connected to each cable and slidably mounted in the hitch box, an energy storing device disposed on each hitch rod to store energy when its cable is under tension for moving that hitch rod outwardly upon failure of its cable, a plurality of trip rods slidably mounted approximately parallel to the hitch rods in the hitch box, a yoke connecting the trip rods into an integral structure, an actuator mounted on each hitch rod and responsive to outward movement of that hitch rod for moving the trip rod structure outwardly, and means responsive to outward movement of the trip rod structure for stopping the engine and the platform.



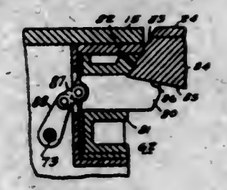
2,408,759
DECK-EDGE ELEVATOR
James Dunlop, Ridgewood, N. J., assignor, by mesne assignments, to Westinghouse Electric Corporation, East Pittsburgh, Pa., a corporation of Pennsylvania
Application December 6, 1943, Serial No. 513,029
19 Claims. (Cl. 187—6)

11. In a deck edge elevator for an upper deck and a lower deck on a ship, a pair of guide rails, an elevator platform for serving the upper deck and the lower deck, said platform having a base platform section disposed on the guide rails and a hinged platform section mounted on the base platform section, a stowing power means for swinging the hinged platform section from its approximately horizontal position to a near vertical position, a plurality of hoisting cables for the base platform section, an engine for operating the hoisting cables in raising and lowering the platform with the hinged platform section in either its horizontal position or its near vertical position, and guides mounted on the upper deck for maintaining the hinged platform section in its near vertical position while it and the base platform section are being raised or lowered as a unit.



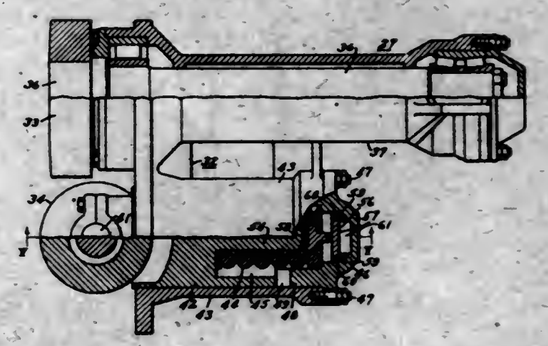
2,408,760
ELEVATOR
James Dunlop, Ridgewood, N. J., assignor, by mesne assignments, to Westinghouse Electric Corporation, East Pittsburgh, Pa., a corporation of Pennsylvania
Application December 22, 1943, Serial No. 515,257
9 Claims. (Cl. 187—95)

9. In an elevator for serving a plurality of floors, a pair of guide rails, a platform disposed between the guide rails, a plurality of cables for operating the platform, a guide movably mounted on each end of the platform in position to engage the guide rail thereat for guiding the platform between the guide rails, springs disposed between the guides and the platform for centralizing the platform between the guide rails, means for limiting the rearward movement of each guide to a predetermined distance, and cams disposed



on the guide rails for engaging the guides and forcing them to their rearward limit as the platform arrives at a selected floor to positively centralize the platform at that floor.

2,408,761
SAFETY DEVICE FOR ELEVATORS
James Dunlop, Ridgewood, N. J., and Hans E. Hansen, Westerligh, Staten Island, N. Y., assignors, by mesne assignments, to Westinghouse Electric Corporation, East Pittsburgh, Pa., a corporation of Pennsylvania
Application December 6, 1943, Serial No. 513,030
21 Claims. (Cl. 187—83)

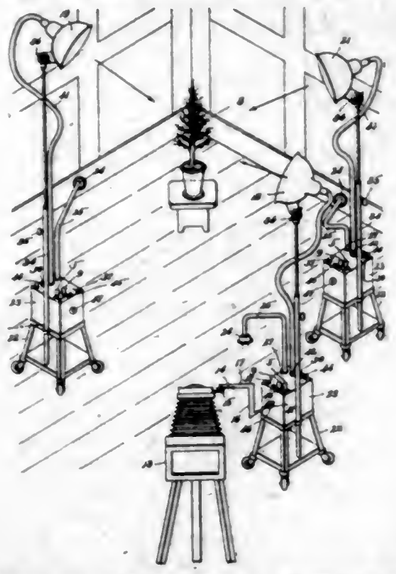


8. In an elevating apparatus, a movable platform, hoisting cables for the platform a safety standard provided with notches disposed adjacent the platform, a safety device mounted on the platform, a plurality of up safety pawls pivotally mounted in the safety device for engaging the notches in the safety standard, said up pawls being fractionally spaced apart with respect to the pitch of the notches in the safety standard, a plurality of down safety pawls pivotally mounted in the safety device for engaging the notches in the safety standard, said down pawls being fractionally spaced apart with respect to the pitch of the notches on the safety standard, means for biasing the pawls toward engagement with the notches in the safety standard, and means responsive to intact condition of the hoisting cables for preventing the pawls from engaging the safety standards and responsive to failure of the hoisting cables for releasing the pawls into engagement with the safety standard to stop the platform.

2,408,762
LOCKING APPARATUS FOR ELEVATOR PLATFORMS
James Dunlop, Ridgewood, and Lennie R. Rissler, Hohokus, N. J., assignors, by mesne assignments, to Westinghouse Electric Corporation, East Pittsburgh, Pa., a corporation of Pennsylvania
Application December 16, 1943, Serial No. 514,520
20 Claims. (Cl. 187—75)

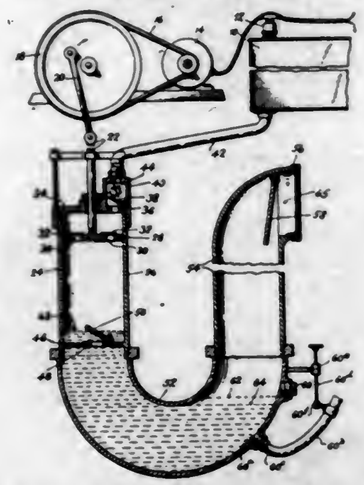
1. In an elevator, a platform for serving a parking floor, a hoisting engine for operating the platform, a stop device on the floor for each end of the platform, to limit its upward movement, a wedging lock at each end of the platform for wedging and locking the platform tightly against the stopping devices on the parking floor, a locking engine for locking and unlocking the locks, and means for causing the locking engine to exert a continuous pressure on the wedging locks while they are in their locking position and thereby constantly maintain the platform tightly against the parking floor.

2,408,763
ELEVATOR
James Dunlop, Ridgewood, and Lennie R. Rissler, Hohokus, N. J., assignors, by mesne assignments, to Westinghouse Electric Corporation, East Pittsburgh, Pa., a corporation of Pennsylvania
Application December 29, 1943, Serial No. 516,046
10 Claims. (Cl. 187—95)



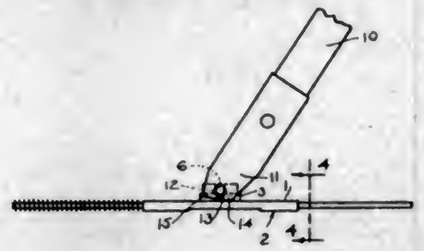
1. A guide shoe for a platform comprising a housing, an end guide member slidably disposed in the housing, means for biasing the guide member outwardly, and a bar seated across a pair of shoulders in the rear of the housing for limiting the inward movement of the guide member, said bar having a predetermined failure point at which it will be deflected upon the application of a predetermined inward pressure by the guide member.

2,408,764
HIGH-SPEED FLASH-PHOTOGRAPHY
Harold E. Edgerton, Belmont, Mass.
Application June 14, 1940, Serial No. 340,580
44 Claims. (Cl. 240—2)



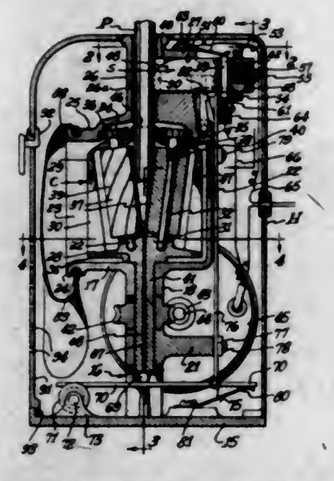
4. Apparatus of the character described for photographing an object having, in combination, a plurality of widely spaced flash-lamps that are unconnected by electric wiring for producing flashes to illuminate the object, a camera having

a shutter, means controlled by the shutter for flashing one of the lamps, and means controlled



by the flashing of the said one lamp for flashing the other lamps.

2,408,765
AIR COMPRESSOR
John E. Erickson, Phoenix, Ariz.
Application January 29, 1944, Serial No. 520,281
2 Claims. (Cl. 230—18)



1. An apparatus of the character described comprising a U-shaped conduit, an upstanding supply conduit connected to one end of said U-shaped conduit and having a valve controlled inlet port, an upstanding pump cylinder connected to the other end of said U-shaped conduit and having an inlet in its bottom end wall, an upwardly opening check valve controlling the passage of fluid through the pump inlet, a piston mounted to reciprocate in the cylinder having a plurality of ports therethrough, downwardly seating check valves mounted on the piston, crank mechanism for actuating the piston, a chamber on the top end wall of the cylinder communicating with the latter through an outlet port, said chamber having a discharge port connecting with a receiver, and an outwardly opening check valve controlling the passage of fluid through said outlet port, said U-shaped conduit being adapted to contain liquid to a level above the inlet port of the pump and at a lower level in the supply end suitable to draw gaseous fluid through the pump inlet and liquid seal the piston and the valve of the pump.

2,408,766
DUST MOP
Conrad Fatland, Chicago, Ill.
Application July 12, 1943, Serial No. 494,427
6 Claims. (Cl. 306—3)

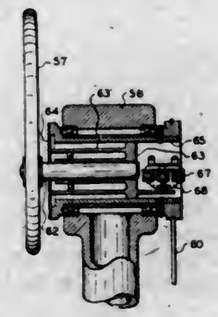
1. In a mop, a mop supporting head, a circular collar fixed in a vertical position to the central portion of the head, a handle rotatably mounted on the collar, a pivot connected with and positioned transversely of the end of the handle, a plurality of notches in the face of said collar adapted to engage the pivot and spring means for normally urging the pivot and notches into cooperation.

2,408,767
PENCIL SHARPENER
Robert B. Fleming, Huntington Park, Calif., assignor to Bert M. Morris Co., Los Angeles, Calif., a firm
Application June 10, 1944, Serial No. 539,615
9 Claims. (Cl. 120—96)

1. In a pencil sharpener; an air blower having a rotor; sharpening elements carried by said rotor; and an air inlet tube leading into said rotor and through which a pencil may be extended between said elements for sharpening.

2,408,768
QUARTZ CRYSTAL HOLDER
Joseph E. Fox, Neil A. Nelson, and William S. Quincy, Jr., Dayton, Ohio
Application June 5, 1944, Serial No. 538,798
4 Claims. (Cl. 171—327)
(Granted under the act of March 3, 1883, as amended April 30, 1928; 370 O. G. 757)

1. A crystal holder comprising a base provided with plug-in terminals, contact plates carried by said base and connected with said terminals, said plates having inwardly and upwardly inclined flanges and lower inwardly and perpendicularly directed flanges, a chase adapted to be mounted between said contact plates and between the flanges thereof, a spring adapted to be compressed between one of said contact plates and the adjacent electrode plate, a moistureproof housing adapted to slip over and receive said con-

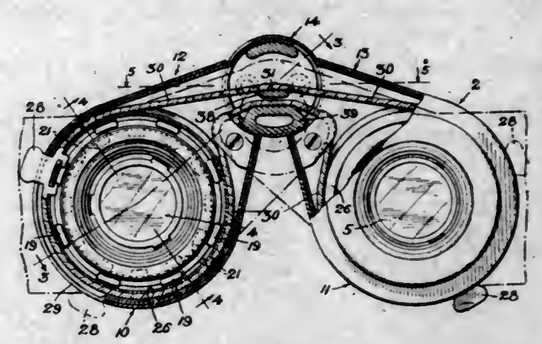


tact plates and chase and to maintain compression of said spring, and means for securing said base and housing in moistureproof assembled relation.

2,408,769
METHOD OF PRODUCING SOLUTIONS OF CHLORIDES OF POLYVINYL
Maurice Louis Auguste Fluchaire, Lyon, France; vested in the Alien Property Custodian
No Drawing. Application April 15, 1941, Serial No. 388,644. In France April 15, 1940
6 Claims. (Cl. 260—32)

6. A new industrial product comprising a solution of chloride of polyvinyl in a member of the group consisting of cyclopentanone and methyl-cyclopentanone.

2,408,770
ELECTROHYDRAULIC CONTROL SYSTEM
Carl A. Frische, Great Neck, George P. Bentley, Garden City, and Percy Halpert, Kew Gardens, N. Y., assignors to Sperry Gyroscope Company, Inc., Brooklyn, N. Y., a corporation of New York
Application November 19, 1942, Serial No. 466,208
6 Claims. (Cl. 244—83)

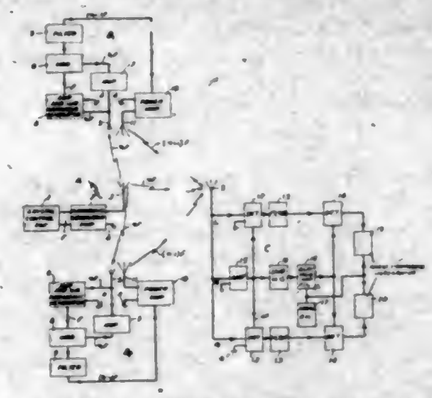


1. In a system of the character described, the combination of, a control column mounted to move about a first axis, a wheel mounted on said column to move about a second axis, a manually operable member for moving said wheel and column about the respective axes thereof, an elastic sleeve connecting said wheel and member, an elastic diaphragm connecting said column and member, a first pick-off carried by said column for measuring stretch in said sleeve, and a second pick-off carried by said column for measuring stretch in said diaphragm.

2,408,771
AUSTENITIC CHROMIUM-NICKEL-IRON ALLOY
Howard M. German, East Orange, N. J., assignor to Driver-Harris Company, Harrison, N. J., a corporation of New Jersey
No Drawing. Application January 1, 1944, Serial No. 516,665
6 Claims. (Cl. 75—128)

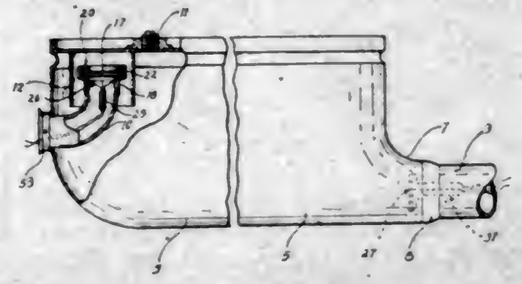
1. An austenitic chromium-nickel-iron alloy having high creep resistance at temperatures up to 1800° F. comprising substantially 35% nickel, substantially 15% chromium, 0.5 to 3.0% titanium, 0.5 to 3.5% of a metal from the group consisting of molybdenum and tungsten, 1.10 to 1.70% silicon, 0.75 to 2.0% manganese, 0.30 to 0.80% carbon, balance substantially all iron.

2,408,772
VARIABLE DENSITY FILTER ATTACHMENT FOR BINOCULARS
Charles J. Glasser, Chicago, Ill.
Application February 11, 1944, Serial No. 521,899
7 Claims. (Cl. 88—34)



1. The combination with a pair of binoculars including two barrels connected to swing about a common axis for adjustment toward and from each other, of a polarizing lens set comprising two pairs of polarized lenses, one pair for each barrel and detachably connected with respect thereto mounted to swing about said axis with the barrel, the two lenses of each pair being juxtaposed, one lens being rotarily adjustable with respect to the other, and transmission means between said adjustable lenses whereby rotarily adjusting one lens of one pair will cause a corresponding rotary adjustment of a lens of the other pair, the connection between the barrels comprising a pair of hinge members, the mounting for the polarized lenses comprising a second pair of hinge members secured to said pairs of lenses, respectively, said hinge members having provisions to enable the axes of said hinge members to be offset with respect to each other when the lenses are mounted on the barrels whereby the lens set may be used selectively with different binoculars having different lengths of hinge members.

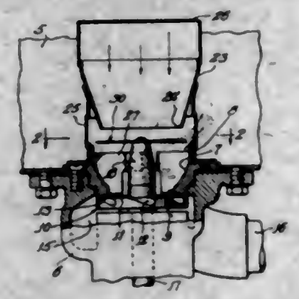
2,408,773
POSITION DETERMINING SYSTEM
William M. Goodall, Oakhurst, N. J., assignor to Bell Telephone Laboratories, Incorporated, New York, N. Y., a corporation of New York
Application March 31, 1942, Serial No. 436,995
10 Claims. (Cl. 250—11)



1. In a phase integration position determining system, means for transmitting from two spaced geographical points waves of different frequencies, means at a mobile body for securing a reference current having a constant phase angle and for obtaining from said waves a signal

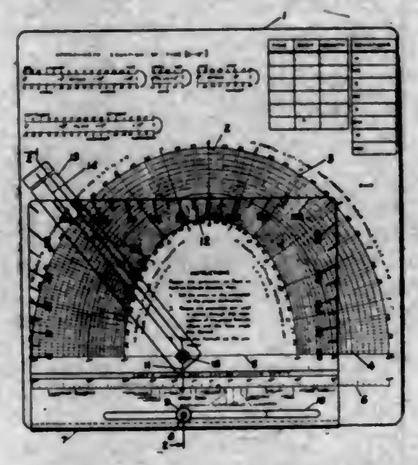
current having a phase angle variation dependent upon only the difference in the distances of

said body to said points, and a phase integrator at said mobile body for comparing said currents.



2,408,774
SPRAY TANK FOR DISPERSING FLUIDS FROM AIRCRAFT
Rupert Goddard, Havre de Grace, and Fleming R. Weaver, Edgewood Arsenal, Md.
Application April 24, 1942, Serial No. 440,388
4 Claims. (Cl. 244—134)
(Granted under the act of March 3, 1883, as amended April 30, 1928; 370 O. G. 757)

1. A liquid spray device for airplanes comprising a jettisonable storage tank for the liquid to be dispersed and adapted to be mounted on the airplane, an internally positioned vent tube opening at one end thereof to the atmosphere through the wall of the tank whereby positive pressure is produced for discharging the contents of the tank and at an opposite end opening into the tank, a discharge line extending from the tank, destructible closure elements for the vent tube and discharge line respectively, and detonating instrumentalities disposed in proximity to each of the respective closures for removing them, each of said instrumentalities having electrical control wires extending therefrom for operation by remote control.

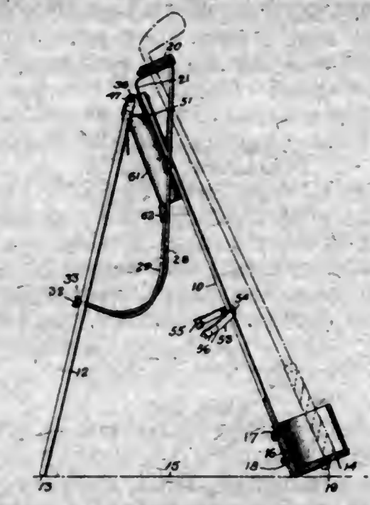


2,408,775
BOOSTER PUMP
Robert P. Greenwood, Youngstown, Ohio, assignor to Pesco Products Co., a corporation of Ohio
Application October 14, 1943, Serial No. 506,165
14 Claims. (Cl. 103—113)

1. In a centrifugal pump, a housing having an impeller chamber; a centrifugal impeller rotatable in said chamber, a fluid inlet throat communicating with said chamber forwardly of said impeller; a fluid guide for directing fluid to said inlet; and a beater interposed between said inlet throat and said fluid guide, said beater being arranged coaxially with said impeller for rotation in a plane normal to the axis of rotation of the impeller and consisting of an unpitched member having leading edges and trailing edges conformed and arranged to operate so that rotation of the beater about said axis will cause bubbles of vapor to be generated from fluid directed by said guide to said throat without directly accel-

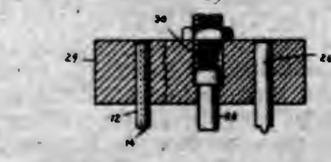
erating the speed of the fluid in the direction of the said axis, the trailing edges of said beater being adapted to collect vapor bubbles along the same and move the bubbles radially to the tips of the beater to be ejected therefrom into a zone outside the influence of the fluid guide.

2,408,776
AZIMUTH COMPUTER
Joseph Hilsenrath and Samuel Globe, United States Navy
Application March 20, 1945, Serial No. 583,823
13 Claims. (Cl. 33—1)
(Granted under the act of March 3, 1883, as amended April 30, 1928; 370 O. G. 757)



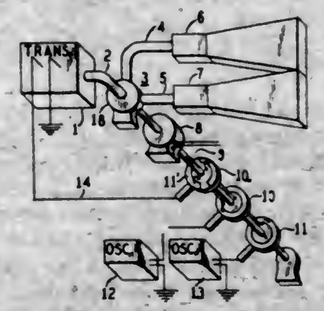
1. In an azimuth computer, a base member comprising a grid composed of confocal hour angle hyperbolas and latitude ellipses, said base member having a plurality of bearing surfaces parallel to the minor axis of the ellipses, a protractor member mounted on the base member, said protractor member having means cooperating with and engaging said bearing surfaces, whereby said protractor member is slidably but non-rotatably moveable parallel to said minor axis.

2,408,777
TRIPOD GOLF BAG
Newton D. Holbrook, Thomaston, Conn.
Application November 12, 1943, Serial No. 510,069
4 Claims. (Cl. 150—1.5)



1. In a tripod golf bag, a main leg having a cup-shaped club handle receptacle at the lower end thereof, a pair of swinging legs pivoted to said main leg at the upper portion thereof, spring means pressing said swinging legs outwardly at all times, and a pair of triangular angle plates arranged in vertical diverging planes secured to said

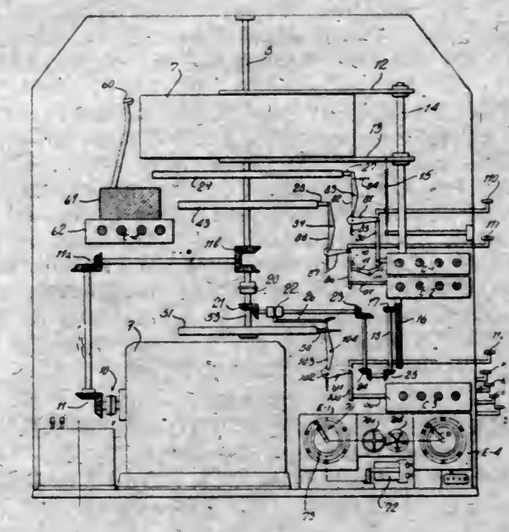
main leg and having stop wings on their opposite edges for confining the upper end of said swinging



legs so as to limit the movement of said swinging legs away from said main member.

2,408,778
METHOD OF MAKING COMBS FROM SHEET STOCK
William Huppert, New York, N. Y., assignor to Delamere Company, Inc., a corporation of Delaware
Application December 30, 1943, Serial No. 516,171
3 Claims. (Cl. 113—116)

1. The method of making a comb from sheet stock, which comprises feeding the stock with a step by step movement, removing a portion of the stock at each period of rest of the feed to define the opposed edges of two adjacent teeth and the edge of a connecting portion, temporarily raising the stock out of its normal plane of travel to provide slack, and forming a crimp in the slackened stock between each pair of teeth successively to draw the teeth closer together.

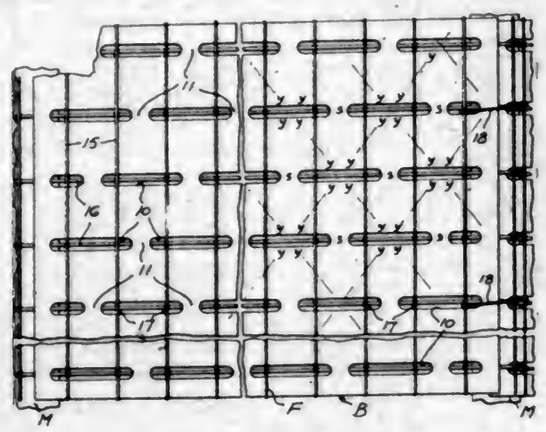


2,408,779
HIGH-FREQUENCY COAXIAL DISTRIBUTOR AND SYSTEM
Frederic A. Jenks, Mineola, and Donald F. Folland, Hempstead, N. Y., assignors to Sperry Gyroscope Company, Inc., Brooklyn, N. Y., a corporation of New York
Application November 27, 1940, Serial No. 367,330
12 Claims. (Cl. 250—11)

1. In apparatus of the character described, a distributor comprising a casing, a co-axial supply line connected to said casing for supplying high frequency energy, a plurality of co-axial load lines connected to said casing for receiving high frequency energy passing therethrough from said supply line, separately movable contact means within said casing for connecting said supply line to each of said load lines, and motor driven cam means for intermittently actuating said movable contact means to effect intermittent supply of high frequency energy to said co-axial load lines.

10. In the method of transferring the flow of modulated radio-frequency carrier energy from a first path to a second path, the steps comprising in the following order, discontinuing the modulation of said carrier energy, directing said carrier energy to flow along said second path, discontinuing the flow of said carrier energy to said first path, and thereupon again modulating said carrier energy.

2,408,780
METEOROLOGICAL RECORDING METHOD AND APPARATUS
Chung-Chin Kao, New York, N. Y.
Application April 5, 1944, Serial No. 529,690
18 Claims. (Cl. 178—34)

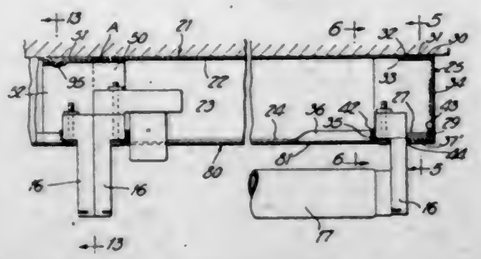


1. In a machine of the character described, a type face drum having a large number of type faces on the periphery thereof each type face comprising a plurality of separate intelligence bearing elements, said drum being mounted for rotary and axial movement; first, second and third digit selector means each including permutation-control mechanism; and means responsive to the settings of said permutation control mechanisms to position the drum with a selected type face in registry with a printing point.

2,408,781
LATHING
Albert C. Karelius, Altadena, Calif.
Application February 12, 1945, Serial No. 577,507
9 Claims. (Cl. 72—116)

1. Lathing of the class described comprising: a backing member of flexible sheet material having elongated openings spaced end to end in parallel rows to leave relatively narrow webs of backing sheet material between the ends of the openings; the openings of each row being staggered with respect to the openings of adjacent rows; a metal reinforcing fabric having wires spanning said openings longitudinally thereof on one side of the member, and having other wires

spanning all openings of all rows transversely thereof on the other side of the member; and



means permanently securing said wires together at their intersections in said openings.

2,408,782
METHOD OF MAKING A VARNISH
Louis René Joseph Kientz, Paris, France; vested in the Alien Property Custodian
No Drawing. Application February 26, 1942, Serial No. 432,484. In France March 26, 1941
4 Claims. (Cl. 260—30)

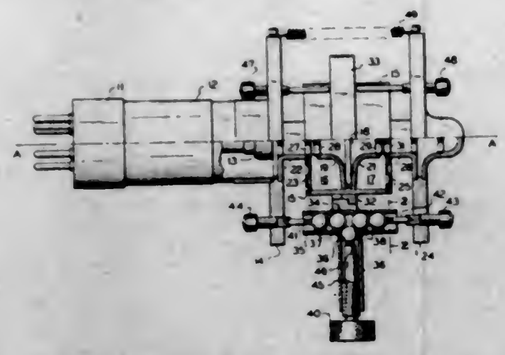
1. The method of making a baking varnish which comprises resinifying 250 grams of phenol and 200 grams of formaldehyde 40% solution with heat in the presence of the product of fifty grams of 20% ammonia and three grams of tartaric acid, decanting the resin, diluting it with a mixture of acetone and butanol and mixing it with a solution of 90 grams of coumarone resin of 80–81° C. fusion point, in 250 grams of benzene.

2,408,783
EXTENSIBLE LIGHTING FIXTURE
Irving I. Kloner, Brooklyn, N. Y.
Application December 7, 1943, Serial No. 513,209
9 Claims. (Cl. 240—1)

9. An extensible lighting fixture comprising a plurality of housing units disposed in end to end relation, each unit including a channel member, the channel members being open at their meeting ends, individual means for connecting the open ends of the channel members together, each of said individual means comprising a channel coupling member fixed to the end of one of said channel members in telescoping engagement with the open end of the adjacent channel member, a central channel provided in the channel coupling member, a boss provided on the telescoping portion of the channel member and being seated in said channel, a screw threadedly passing through said boss and channel for fixedly securing the telescoping parts together, and lamp socket supporting means carried by said housing units and by the channel coupling member.

2,408,784
ANHYDROUS MONOFLUOROPHOSPHORIC ACID AND METHOD OF PRODUCING IT
Willy Lange and Ralph Livingston, Cincinnati, Ohio, assignors, by direct and mesne assignments, to Ozark Chemical Company, Tulsa, Okla., a corporation of Delaware
No Drawing. Application March 11, 1943, Serial No. 478,838
6 Claims. (Cl. 23—139)

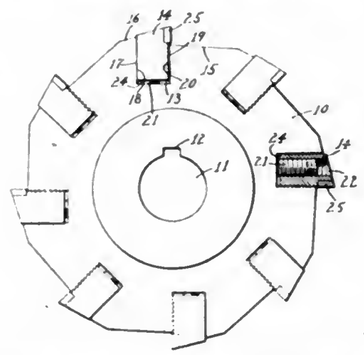
5. As a new article of manufacture, anhydrous monofluorophosphoric acid having the formula H_2PO_3F, being a clear, oily liquid substantially colorless and odorless, of a density of about 1.82 at 25° C. and containing about 31% P and about 19% F.



2,408,785
METHOD OF PRODUCTION OF ANHYDROUS MONOFLUOROPHOSPHORIC ACID
Willy Lange, Cincinnati, Ohio, assignor, by direct and mesne assignments, to Ozark Chemical Company, Tulsa, Okla., a corporation of Delaware
No Drawing. Application June 28, 1944, Serial No. 542,603
18 Claims. (Cl. 23—139)

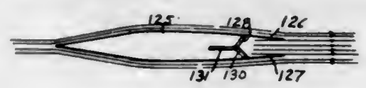
1. In a method of producing anhydrous monofluorophosphoric acid, the steps of mixing phosphorus pentoxide and hydrofluoric acid of any HF concentration between about 69% and 100% inclusive according to the equation

$$P_2O_5+(2+X)\,HF+(1-X)\,H_2O=X.HPO_2F_2+(2-X)\,H_2PO_3F$$



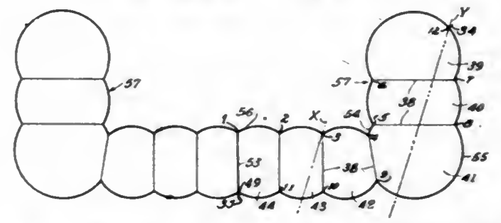
in which X has any value in the range from 0 to 1 inclusive, and maintaining the mixture in the presence of heat and under conditions preventing the escape of any products of the reaction until the latter goes to completion according to said equation.

2,408,786
TUNING MECHANISM
Anthony J. Lombardi, Floral Park, N. Y., assignor to Sperry Gyroscope Company, Inc., Brooklyn, N. Y., a corporation of New York
Application February 15, 1943, Serial No. 476,011
5 Claims. (Cl. 178—44)



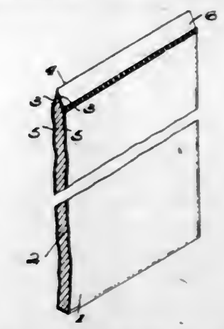
1. In a fine adjustment mechanism for gang tuning electronic devices and the like, a support having a cylindrical axial bore, a rod mounted in said bore for adjustment axially of said bore, a slidable spherical ball in said bore adapted to be displaced by adjustment of said rod, opposed radial bores in said support and opening into said axial bore, a spherical ball slidable in each of said radial bores, each of said balls being of substantially the same diameter as its respective bore with the balls in said radial bores being substantially smaller than and adapted to contact said first ball, the size differential between the balls in the radial bore and the ball in the axial bore tending to ensure that the latter-named ball is confined to the axial bore during its operative travel, and means for adjusting said rod to effect simultaneous outward displacement of the balls in said radial bores.

2,408,787
INSERTED TOOTH MILLING CUTTER
Edward O. Lowell, South Pasadena, Calif., assignor, by mesne assignments, to Lowell and Grayson Manufacturing Company, Monrovia, Calif., a corporation of California
Application July 8, 1943, Serial No. 493,815
5 Claims. (Cl. 29—105)



5. A milling cutter of the inserted tooth type, comprising a body member having substantially radial transverse slots, cutter insert members disposed in and closely fitting said slots, said cutter members having wedge-shaped serrations transversely in the front face thereof for adjustable slidable engagement in complementary serrations provided generally longitudinally of the axis of rotation of the body in the front wall of the slots adapted to be wedgingly engaged upon slight substantially radial movement of the cutter members relative to the body member, the back wall of the slots and the abutting back face of the cutter members being flat and parallel to the plane of the front wall of the slots and means for forcing the cutter members substantially radially outwardly with respect to said body member to cause wedging engagement of the aforesaid serrations, whereby to secure the cutter members in substantially immovable position.

2,408,788
AIRFOIL
Charles Townsend Ludington, Ardmore, Pa., and Roger W. Griswold, II, Old Lyme, Conn.
Application June 16, 1939, Serial No. 279,416
1 Claim. (Cl. 170—172)

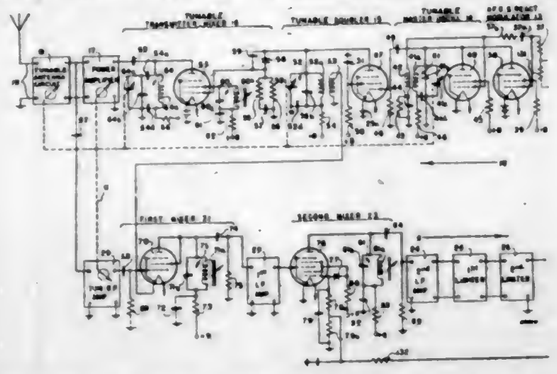


An airfoil for rotor use comprising a blade the tip end region only of which has a wedge-shaped entering edge and an open trailing edge, intake means on the blade spaced hubwardly from the tip, and the whole so arranged that air is drawn into the intake and centrifugally flung outwardly and rearwardly of the tip end only to minimize drag at critical compressibility speeds attained by said tip, means controlling the open trailing edge and responsive to blade movement to regulate the said open trailing edge.

2,408,789
INFLATABLE BOAT AND METHOD OF MAKING SAME
August G. Luisada, New York, N. Y.
Application March 11, 1942, Serial No. 434,241
29 Claims. (Cl. 9—2)

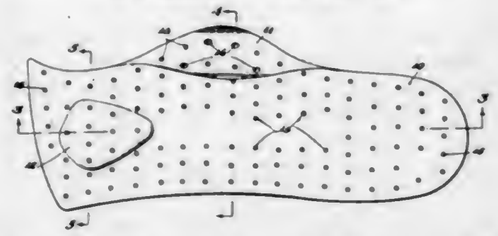
1. An inflatable boat having bottom and sides comprising two joined symmetrical units, each unit comprising two superimposed sheets of fabric of predetermined elongated shape, and enveloped between two layers of air-impervious material which are united at their edges to form the unit, one layer constituting the ultimate outside and the other the ultimate inside of half of a finished boat, interconnecting means extending between the sheets from the sheet adjacent the outside layer toward the sheet adjacent the inside layer in a direction inwardly from the longitudinal edges of the layers so that the interconnections form compartments between the sheets, the intermediate compartment which has converging interconnections forming the ultimate chine of the boat, said units being united along a substantial area adjacent the contiguous edges from end to end along the keel line to form a complete boat.

2,408,790
RAZOR BLADE AND OTHER CUTTING TOOLS
Edward L. Mack, New York, N. Y.
Application May 16, 1944, Serial No. 535,861
14 Claims. (Cl. 76—104)



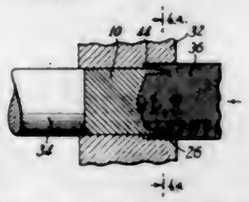
5. The method of making a cutting tool which includes the steps of forming a blank having at least one edge basically composed of aluminum, forming a bevel along at least one side of the blank at said edge, rendering the edge of the bevel and at least the surface adjacent thereto on at least one face harder than the body material of the blank by oxidizing the said edge and said surface, and then sharpening the hardened edge.

2,408,791
RADIO COMMUNICATION SYSTEM
Henry Magnuski, Chicago, Ill., assignor to Galvin Manufacturing Corporation, Chicago, Ill., a corporation of Illinois
Application June 21, 1943, Serial No. 491,651
9 Claims. (Cl. 250—13)



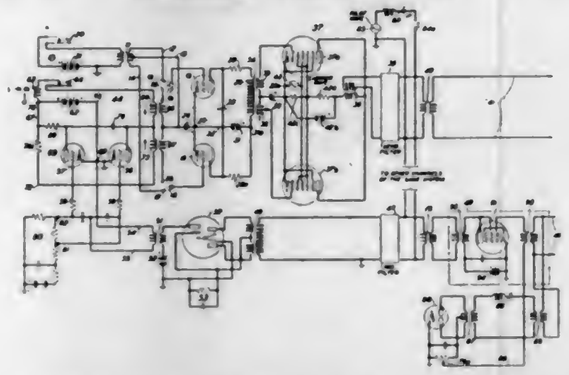
1. In a frequency modulated radio transmitting and receiving system which includes means for selectively conditioning the system for signal

transmission or reception, a receiving channel including a mixer stage followed by an intermediate frequency section, a transmission channel including a carrier producing oscillator coupled to said mixer stage to operate as a local oscillator during signal reception, and inversely acting means coupled between said intermediate



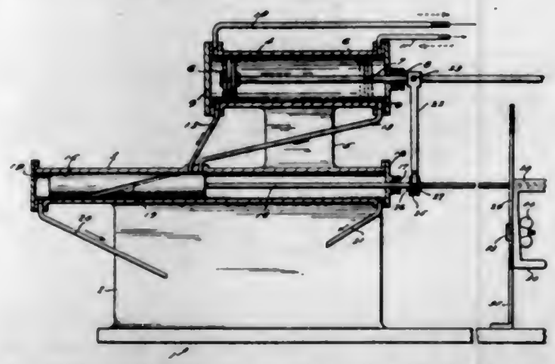
frequency channel and said oscillator for automatically controlling the output frequency of said oscillator to hold substantially constant the center frequency of a frequency modulated carrier transmitted through the intermediate frequency section of said receiving channel during signal reception.

2,408,792
ARCH SUPPORT
Meyer Margolin, Elgin, Ill.
Original application August 17, 1939, Serial No. 290,559. Divided and this application January 1, 1943, Serial No. 470,994
5 Claims. (Cl. 36—3)



4. An arch support comprising a molded expanded rubber, a sidewardly and upwardly extending integral lap, perforations through said arch support, and transverse grooves across the bottom of said arch support, said grooves having terminating walls at each end so as to cause air to be pumped up through said perforations.

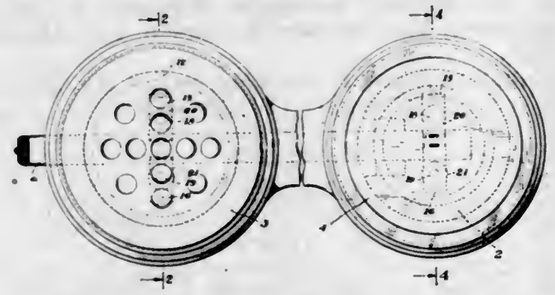
2,408,793
MANUFACTURE OF NUTS AND THE LIKE
Veyne V. Mason, Scotch Plains, N. J., assignor to Elastic Stop Nut Corporation, Union, N. J., a corporation of New Jersey
Application February 6, 1943, Serial No. 474,931
17 Claims. (Cl. 10—85)



6. For the manufacture of forged metal nut blanks, a die having a circular bore, a cooperating backing punch arranged to enter and fill one end of said bore and back a blank therein and a cooperating forming punch adapted to enter the opposite end of said die, said forming punch having an annular groove in its working end, the inner wall of said groove being substantially cylindrical and the outer wall thereof tapering inwardly from a diameter at the working end of the punch equal to at least the diameter of a blank held in the die bore.

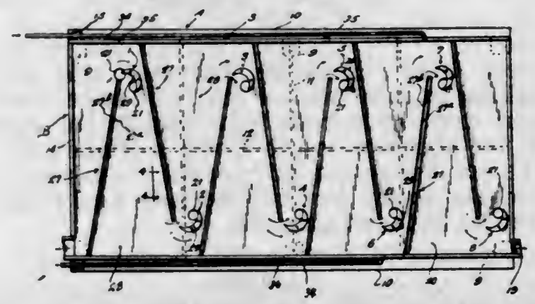
2,408,794
CARRIER WAVE SIGNAL SYSTEM
Andrew L. Matte, Summit, N. J., assignor to Bell Telephone Laboratories, Incorporated, New York, N. Y., a corporation of New York
Application October 20, 1942, Serial No. 462,756
4 Claims. (Cl. 178—66)

1. An alternating current signal transmission system comprising a source of alternating current, a transmission channel therefor, means for preventing the transmission of alternating current from said source to said channel at all times except when intelligence is being sent, means for producing voltages indicative of mark-to-space and space-to-mark transitions to identify the beginnings and endings of marking and spacing signal elements, and means controlled by said voltages to transmit impulses of alternating current from said source to said channel, said last means including means for causing the transmission of alternating current impulses of successively different amplitudes.



2,408,795
CONTROL MEANS FOR FLUID PRESSURE MOTORS
John F. McGlone, San Diego, Calif.
Application March 22, 1944, Serial No. 527,563
1 Claim. (Cl. 121—41)

In combination, a double-acting fluid pressure motor comprising a power cylinder having a power piston therein, a rod connected to said power piston and extending through one end of said power cylinder, a pipe for the inlet or outlet of pressure fluid at each end of said power cylinder, and means to vary the stroke of said power piston including a control cylinder, a rotatably

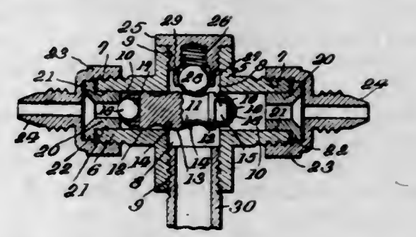


adjustable elongated control piston valve reciprocable in said control cylinder, means connecting said control piston valve to the power piston for travel therewith in the same direction, said control piston valve having a longitudinal diagonally disposed groove therein, said groove being closed at one end of the control piston valve and open at the other end thereof, exhaust conduits connecting the ends of the power cylinder with the intermediate portion of the control cylinder, and means to rotatably adjust said control piston valve to vary the point of registry of the exhaust conduits with said groove, said control cylinder having a vent at one end and a fluid outlet at the other end in constant communication with the open end of said groove.

2,408,796
TELEPHONE INSTRUMENT
Ernest S. McLarn, Manhasset, N. Y., assignor to International Standard Electric Corporation, New York, N. Y., a corporation of Delaware
Application July 29, 1944, Serial No. 547,171
10 Claims. (Cl. 179—101)

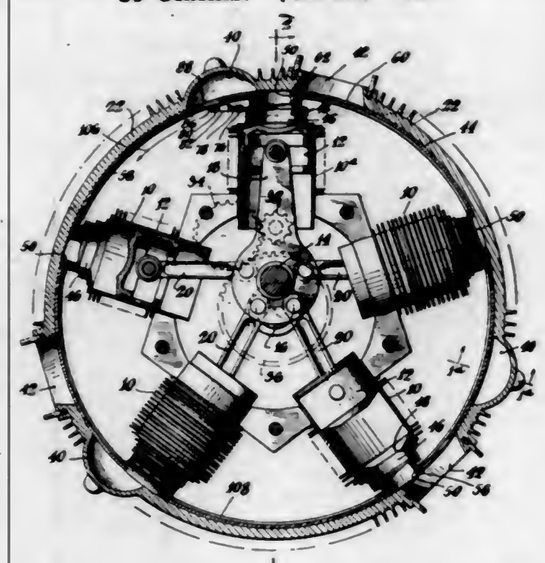
1. A telephone instrument comprising a transducer capsule having two electrode terminals, a detachable member shaped at one end to fit on to the back of said transducer capsule, a pair of connectors each having at least one sharp projecting prong, means for locating said connectors on the other end of said member and electrical connecting means between said connectors and said respective electrode terminals.

2,408,797
ORE CONCENTRATING TABLE
Erwin R. McPheters, Boise, Idaho
Application February 1, 1944, Serial No. 520,669
4 Claims. (Cl. 209—458)



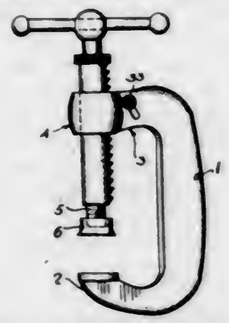
1. In a concentrator and separator table unit for ore-pulp, a base plate, a transversely arranged divider partition on said plate extending from one side wall and terminating in spaced relation from the other side wall, a second divider partition extending from the last-named side wall and having its free end portion terminating in spaced relation to the first-named side wall, a discharge hole in the plate between the free outer end of the first-named partitioning divider and adjacent intermediate portion of the second divider, and a pivotally mounted manually adjusted regulator and deflector element on the plate having one end cooperable with the adjacent free end of the first-named divider and its opposite end overlapping and cooperable with the discharge opening.

2,408,798
ALKYLATION OF MIXED OLEFINS
Richard N. Meinert, Westfield, N. J., assignor to Standard Oil Development Company, a corporation of Delaware
No Drawing. Application August 4, 1943, Serial No. 497,390
9 Claims. (Cl. 260—683.4)



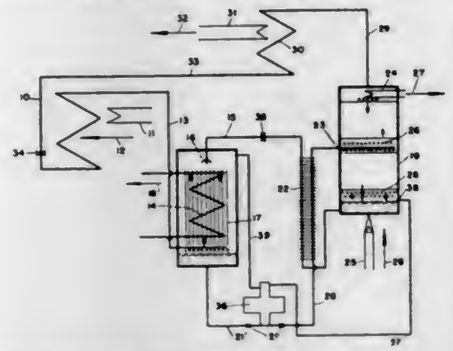
1. A process for alkylating an isoparaffin with a mixture of different olefins which comprises adding the mixed olefin feed to a mixture of isoparaffin and an $AlCl_3$-hydrocarbon complex catalyst prepared by agitating, prior to the alkylation reaction proper, a suspension of $AlCl_3$ in an isoparaffin while adding an olefin in small increments until a dark reddish brown mobile liquid catalyst consisting of an aluminum chloride-hydrocarbon complex catalyst is formed, and maintaining alkylating conditions of temperature and pressure which are optimum for that component of said mixture of olefins which is the most difficult to alkylate.

2,408,799
SHUTTLE VALVE
Joseph F. Melichar, Cleveland, Ohio,,assignor to The Parker Appliance Company, Cleveland, Ohio, a corporation of Ohio
Application January 30, 1943, Serial No. 474,155
2 Claims. (Cl. 251—118)



2. A shuttle valve having a generally cruciform casing presenting an elongated main body and two leg extensions axially aligned with their common axis disposed in right angular relation to the longitudinal center of said main body, said main body having a straight through bore centrally longitudinally thereof and forming a plug chamber at one end and a service port at its other end, said leg extensions having a straight through bore axially thereof and intersecting the firstmentioned bore, a valve seat in each leg extension bore portion, a shuttle valve element slide guided at its ends in said leg bore portions and having provision for alternately engaging and closing one seat and disengaging and opening the other seat, and detent means in the plug chamber engageable with the valve element for yieldably retaining the valve element in one or the other of its shifted positions, said valve element having clearances at each end thereof for opening communication about the unseated end of the valve element and between the service port and the leg bore portion in which said unseated end is guided, the valve element and detent means being so constructed and arranged that communication at an end of the shuttle is opened only after the communication at the other end of the shuttle is closed and after the detent has passed the center of the shuttle.

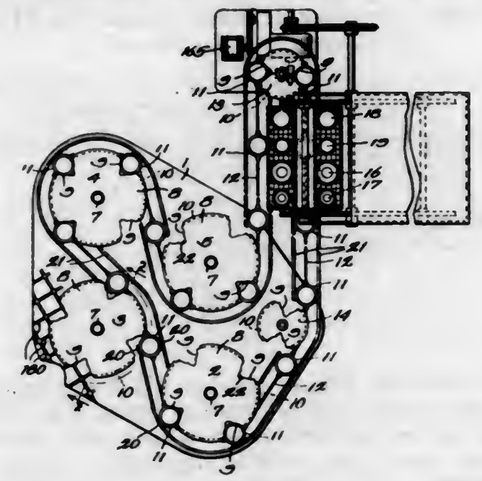
2,408,800
ENGINE
André J. Meyer, Lexington, Ky., assignor to Mawen Motor Corporation, New York, N. Y., a corporation of Delaware
Application February 20, 1940, Serial No. 319,851
39 Claims. (Cl. 123—44)



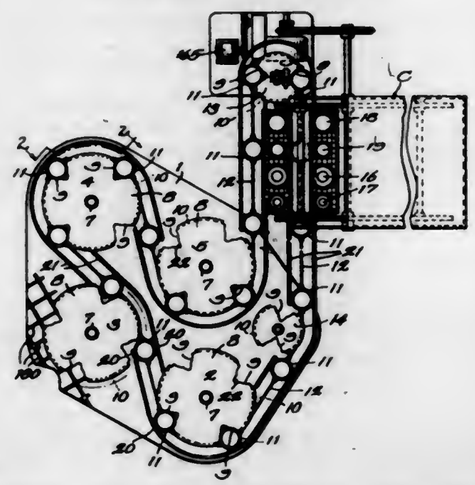
1. In combination, a ported valve member and a structure providing a ported working chamber, said valve member and said structure being mounted for relative movement with respect to each other, a hollow sealing element carried by said structure and having an end sealing surface in sliding contact with said valve member to provide a seal for fluid flowing through said ports, said sealing element being subjected to force tending to move it outwardly relative to said structure into pressure contact with said valve member, and said end sealing surface being shaped and located to have its center of gravity ahead of the center of pressure of the force tending to move the element into contact with the valve member, when considered in the direction of relative movement of said structure with respect to the valve member.

2,408,801
"C" CLAMP
Albert W. Miller, Jamaica, N. Y.
Application July 7, 1943, Serial No. 493,695
2 Claims. (Cl. 144—305)

1. A clamp including a C-shaped frame, a jaw formed in one end portion of said frame, a bore in the opposite end portion of said frame adapted to receive movable clamping means, said means including a sleeve slidable in said bore and a clamping screw traversing said sleeve and secured to the same by means of screw threads, the exterior wall of said sleeve being provided with a plurality of toothed serrations, a wedge-shaped cavity in said opposite end of said frame, a pawl, having a plurality of toothed serrations, which is similar in shape to said cavity but of smaller dimensions, mounted within the same so as to remain free for axial and lateral movement with respect to said sleeve, a resilient means urging said pawl into engagement with said sleeve, said pawl being adapted to permit axial displacement of said sleeve toward said jaw and to oppose a displacement in the opposite direction, and being further adapted to be firmly wedged between said sleeve and the tapered wall of said cavity when a force is tending to push said sleeve away from said jaw whereby a proportional part of the force acting on said sleeve in the axial direction is translated into a radial component causing said pawl to engage said toothed serrations the more firmly the higher the value of said force, while simultaneously forcing said sleeve against the wall of said bore, and means operable from the outside to release said pawl to permit axial displacement of said sleeve away from said jaw when said sleeve is free of a clamping force.



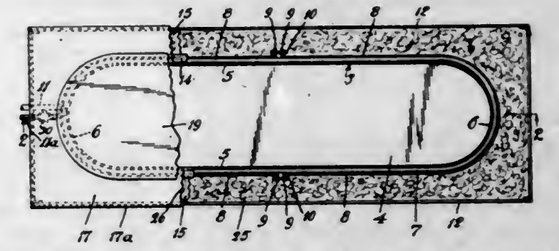
2,408,802
ABSORPTION REFRIGERATION CYCLE
Glen W. Miller, Glendale, Edward L. Kells, Montrose, and Delmar H. Larsen, Los Angeles, Calif.
Application January 15, 1940, Serial No. 313,858
9 Claims. (Cl. 62—119)



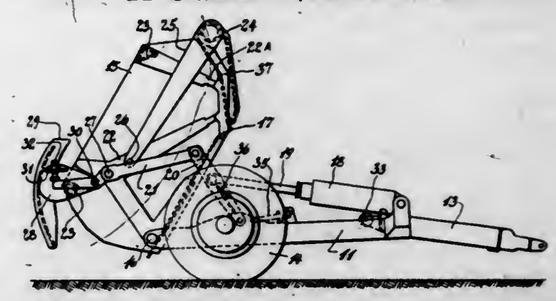
9. An absorption refrigerating apparatus comprising, in combination, an evaporator, an absorber connected to receive refrigerant therefrom, a fractionating tower, means including a conduit and a pump for delivering solvent and absorbed refrigerant from the absorber to the tower, means for actuating said pump comprising a conduit communicating with the fractionating tower adjacent the lower end thereof and adapted to deliver solvent vapor under pressure from the tower to the absorber, a conduit delivering solvent from the tower to the absorber, means for producing indirect heat exchange between the solvent travelling in said conduit from the tower and the solvent and refrigerant travelling in the conduit from the absorber to the tower, a condenser, and means for delivering refrigerant from the upper end of the tower to the condenser and from the condenser to the evaporator.

2,408,803
APPARATUS FOR PREPARING CLAY FOR JIGGERING IN THE MANUFACTURE OF POTTERYWARE
William J. Miller, Swissvale, Pa., assignor to Miller Pottery Engineering Company, Swissvale, Pittsburgh, Pa., a corporation of Pennsylvania
Original application October 6, 1941, Serial No. 413,734. Divided and this application September 22, 1943, Serial No. 503,376
26 Claims. (Cl. 25—22)

1. In combination, a mold for forming pottery, a carrier therefor, means for moving the carrier and mold with sustained forward motion in a path wherein clay is preformed on the molding surface of the mold, a preformer, a support therefor, means for moving the support and preformer in another, and different, orbital path with sustained forward movement to bring the mold and preformer into registration and means for moving the preformer and mold relative to one another to effect a preforming operation.



2,408,804
APPARATUS FOR MANUFACTURING JIGGERED POTTERYWARE
William J. Miller, Swissvale, Pa., assignor to Miller Pottery Engineering Company, Swissvale, Pittsburgh, Pa., a corporation of Pennsylvania
Original application October 6, 1941, Serial No. 413,734. Divided and this application September 22, 1943, Serial No. 503,377
26 Claims. (Cl. 25—22)

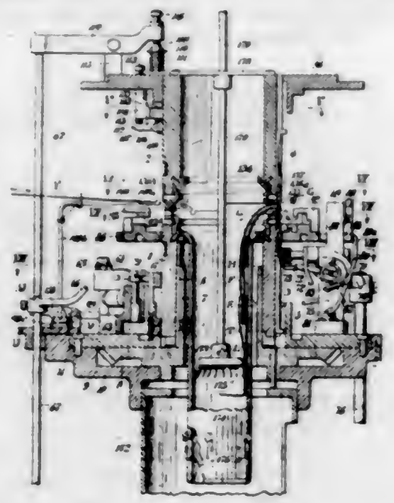


1. In combination, potteryware jiggering apparatus having a turntable associated therewith rotatable about a vertical axis, jiggering implements above said table, and rotatable therewith about said axis, endless flexible mold conveying means looped around said turntable, pottery molds mounted on said conveying means to be carried thereby to said turntable and transported about said axis in register with said jiggering implements thereabove, means for relatively moving said molds and jiggering implements when in register to perform jiggering operations and means operable to continuously drive said conveying means and turntable.

2,408,805
REFRIGERATOR
Arthur T. Millott and Edmund C. Graham, Minneapolis, Minn., assignors to Conditioned Air Equipment Co., Minneapolis, Minn.
Application August 11, 1944, Serial No. 548,948
5 Claims. (Cl. 62—126)

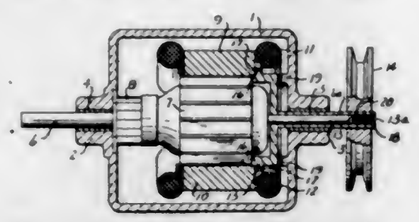
1. In a refrigerating structure, an evaporator and storage unit including an inner member having a circumferential generally upright side wall, and a bottom wall, of heat conducting material, said upright side wall having arcuate portions connected by generally rectilinear portions, a tube coiled around the exterior of said inner member in a plurality of vertically spaced loops, and an outer flexible draw band structure and means for drawing it tightly about said tube and for thereby holding said tube in close contact with the opposed outer surface of said side wall, said draw band structure including means for forcing inwardly against the tube those parts of the draw band which are opposed to the generally rectilinear portions of the side wall.

2,408,806
SCRAPER
George W. Mork, South Milwaukee, Wis., assignor to Bucyrus-Erie Company, South Milwaukee, Wis., a corporation of Delaware
Application August 2, 1943, Serial No. 496,981
11 Claims. (Cl. 37—133)



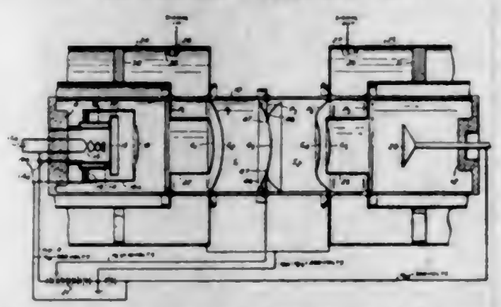
1. In a dumping container, the combination of: a frame; ground supports for said frame; the container proper, pivoted at one end adjacent its bottom on the frame, for tilting movement in a vertical plane, said container proper being open at its pivoted end; a longitudinally reciprocable rod on each side of the container proper, pivoted to the side thereof, and supported by the frame; means for forcibly reciprocating these rods; an end gate pivotally supported by the rod-container-proper assembly, adjacent the pivotal connection between the rods and the container proper; and stop means between the gate and the rods, to limit the downward swinging of the gate with respect to the rods.

2,408,807
KNITTING METHOD AND MACHINE
George Norman, Griffin, Ga., assignor to Spalding Knitting Mills, Griffin, Ga., a corporation of Georgia
Application September 16, 1944, Serial No. 554,350
26 Claims. (Cl. 66—1)



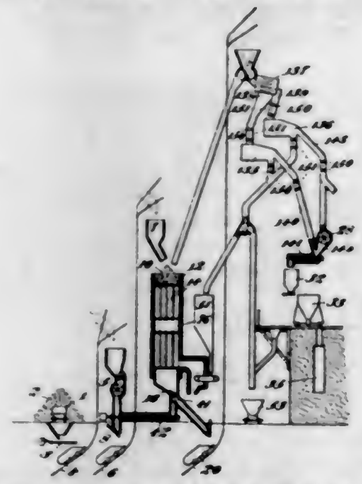
1. A knitting machine having two opposing sets of alternatingly-arranged independent nee-

dles; a yarn feed; means for reciprocating the two needle sets in unison to move alternately in opposite directions past the feed; and means operative at certain times to cause one set of the



needles to knit during movement in one direction and the other set to knit during movement in the opposite direction, and at other times to cause both sets to knit during movement in one direction.

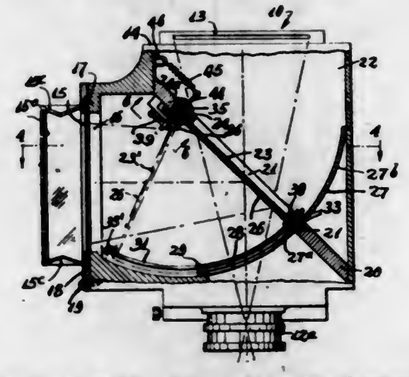
2,408,808
AUTOMATIC CLUTCH AND BRAKE FOR ELECTRIC MOTORS AND GENERATORS
Charles L. Paulus and Raymond K. Stout, Dayton, Ohio
Application July 9, 1943, Serial No. 494,028
1 Claim. (Cl. 172—36)
(Granted under the act of March 3, 1883, as amended April 30, 1928; 370 O. G. 757)



An electric motor which comprises a housing, a field fixed in said housing, axially aligned shaft bearings in said housing, a tubular shaft rotatable and axially movable in one of said bearings, a power take-off member fast on the outer end of said tubular shaft outside said housing and a clutch-and-brake disc fast on the inner end of said tubular shaft within said housing, an armature shaft having one end rotatable in one of said shaft bearings and the other end rotatable in said tubular shaft, an armature on said shaft between said bearings, said clutch-and-brake disc being spaced between the end of said armature and the inside face of said housing, and a spring within said tubular shaft having one end reacting against the end of said armature shaft urging it inward and the other end reacting against the tubular shaft urging it outward, thereby to yieldably hold said clutch and brake disc against the inside face of said housing when no current is passing through said motor, said disc being adapted to be drawn away from said housing and against said armature by stray magnetic lines emanating from said field and armature whenever an electric current is passing through said motor.

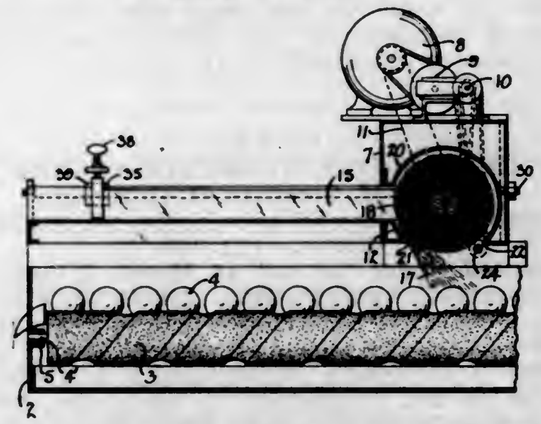
2,408,809
CATHODE BEAM TUBE AND VELOCITY CONTROL ELECTRODE
John R. Pierce, New York, N. Y., assignor to Bell Telephone Laboratories, Incorporated, New York, N. Y., a corporation of New York
Application October 31, 1941, Serial No. 417,326
13 Claims. (Cl. 250—27)

1. A cathode beam device which comprises means for projecting a beam of electrons of substantial cross section over which the electron velocities are substantially uniform, means for accelerating said electrons to comparatively high speeds, means for velocity-varying said high speed beam, a drift space in which said velocity variations are converted into density variations, means for withdrawing energy of said density variations from said beam, and means in said drift space for imparting equal speed reductions in equal times to electrons at all parts of the cross section of said beam.



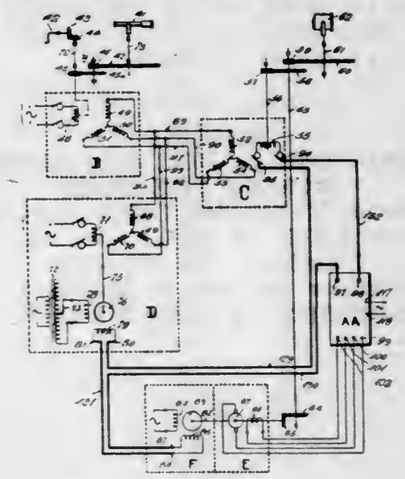
2,408,810
METHOD AND APPARATUS FOR PREPARING COAL FOR COKING
Franz Puening, Bethlehem, Pa.
Application September 11, 1942, Serial No. 457,960
10 Claims. (Cl. 202—27)

5. The process for preparing coal for coking, comprising the storing, conveying and preheating of raw coal in coarser grain sizes, which are adapted to protect the coal against the deleterious action of air and carbon dioxide, then segregating the hot coal into size classes, of larger and smaller particle size, then pulverizing the larger size class to a greater fineness, adapted to produce a reduced bulk density of the coal when mixed with the smaller size-class, then intimately mixing the several classes and accumulating the mixture in a charge hopper, ready for coking.



10. Apparatus for preparing coal for coking which comprises a preheater for heating the coal, an enclosure adapted to separate the coal into branches of different purity, by passing it through a current of inert hot gases recirculated therein, and pairs of sluice gates for avoiding loss of or dilution of recirculated gases by causing the coal to pass into the enclosure and the coal branches to pass out of the enclosure therethrough, the space between each such pair of gates being supplied with inert hot gas.

2,408,811
PROFESSIONAL PHOTOGRAPHIC CAMERA
Michel Resk, New Rochelle, N. Y.
Application August 12, 1943, Serial No. 498,276
7 Claims. (Cl. 95—42)

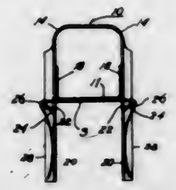


1. A device of the type described comprising a hollow lightproof body having a lens mounted through the front wall of said body, a removable light sensitive element mounted on the back wall of said body, a pair of spaced, parallel and arcuately shaped rods disposed in said body, one of said rods being positioned adjacent the plane of the top wall of said body and proximate to said front wall of said body, the other of said rods being disposed adjacent the plane of the bottom wall of said body and proximate said front wall of said body, means for securing the ends of each of said rods to said body, an arcuate shutter having an opening formed therein, a pair of spaced, radially inwardly extending abutments formed on said shutter each of which are provided with a pair of spaced apertures through which said rods project to form a support for the reciprocation thereon of said shutter, said abutments being disposed on opposite sides of said opening, and a tail piece for said shutter, said tail piece extending laterally from one of said abutments, and means engaging said abutments, alternately, for reciprocating said shutter on said rods.

2,408,812
WAXING MACHINE
Sidney C. Ricke, Mission, Tex.
Application November 26, 1942, Serial No. 467,005
6 Claims. (Cl. 91—44)

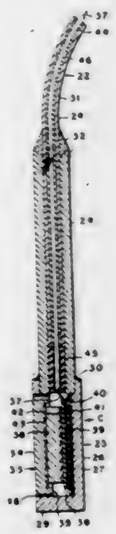
2. A fruit and vegetable waxer including a frame for positioning over the articles to be waxed, means to conduct the articles through said frame, a wax cake support portion, means to move the wax at a predetermined speed, a rotating brush to brush the end of the wax cake to powder the wax, said brush being disposed directly over said first means, additional means to receive and feed back to the brush powdered wax thrown from the brush beyond the angle of contact with the articles, and still additional means to drive said feed means, said brush, and said feed back means.

2,408,813
APPARATUS FOR ELECTRICAL CONTROL
Alger S. Riggs, Washington, D. C., assignor, by direct and mesne assignments, to Sperry Gyroscope Company, Inc., Brooklyn, N. Y., a corporation of New York
Application September 9, 1936, Serial No. 100,017
7 Claims. (Cl. 172—239)



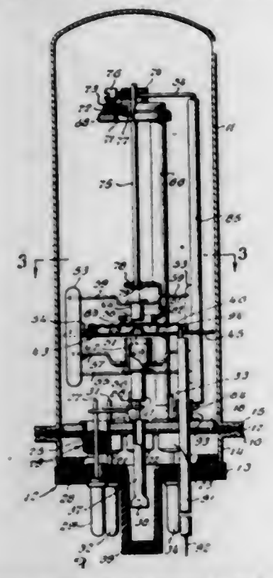
4. In a positional control system, a controlling object, a remotely located controlled object, an electrical positional data transmitter arranged for operation by one of said objects, a transmission line connected thereto, a signal generator actuated by said other object and connected to said line for generating a control signal proportional to the positional disagreement of said two objects, a receiver also connected to said transmission line to operate synchronously with said transmitter, a generator driven by said receiver for obtaining a control signal proportional to the velocity of said receiver, driving means for said controlled object, and means for controlling said driving means jointly in accordance with said disagreement and said velocity signals.

2,408,814
TEMPORARY COATING
George Selden, Cincinnati, Ohio, assignor to Interchemical Corporation, New York, N. Y., a corporation of Ohio
No Drawing. Application May 29, 1943, Serial No. 489,073
2 Claims. (Cl. 106—238)



1. A temporary powder paint characterized by its ready solubility, before and after application, in aqueous alkali, alcohol, gasoline, painter's naphtha, and similar solvents, and by resistance to atmospheric conditions for short periods of time, comprising a dispersion of pigment in the reaction product of rosin with 65%–75% of the molar equivalent of monoethanolamine required to form the rosin ester, the reaction product containing some free acid.

2,408,815
SANDING BLOCK
Emory A. Seward, Evanston, Ill.
Application September 27, 1945, Serial No. 618,851
9 Claims. (Cl. 51—187)



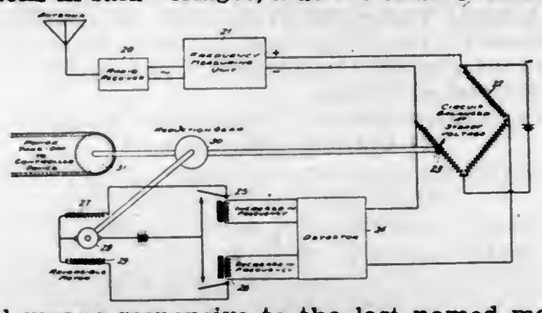
1. A sanding block comprising a sheet metal body having a top wall and parallel side walls with a bridge member disposed between the side walls intermediate the top wall and the lower edges of said side walls, the side walls having slots adjacent the bottom plane of said bridge and wings extending outwardly from said slots with the outer edges of said wings spaced laterally from the side walls in a plane closely adjacent said bottom plane of the bridge.

2,408,816
PIEZOELECTRIC GAUGE AND METHOD OF MAKING THE SAME
Maurice M. Shapiro, Cabin John, Md.
Application Feb. 10, 1944, Serial No. 521,885
7 Claims. (Cl. 171—327)
(Granted under the act of March 3, 1883, as amended April 30, 1928; 370 O. G. 757)

1. A piezoelectric gauge for use in the observation and measurement of a pressure wave of high amplitude and short duration, such as produced by the underwater detonation of a charge of high explosive, comprising a thin flat hollow cylindrical waterproof shell formed of elastic and electrically conductive metal, said shell including spaced end walls and a cylindrical side wall provided with an integral tubular outlet, a piezoelectric transducer assembly comprising a plurality of thin flat discs forming with the end walls of said cylindrical shell a solid body composed entirely of parallel layers and thereby inherently capable of withstanding extremely high pressure axially of the gauge, one of said end walls constituting a grounded electrode for said transducer assembly to permit reduction in the mass and size of the gauge, the mass of the shell being small and the greatest dimension of the shell being less than one-half inch.

2,408,817
ELECTRON DISCHARGE APPARATUS
Donald L. Snow, Hempstead, N. Y., assignor to Sperry Gyroscope Company, Inc., a corporation of New York
Application November 29, 1943, Serial No. 512,222
9 Claims. (Cl. 250—27.5)

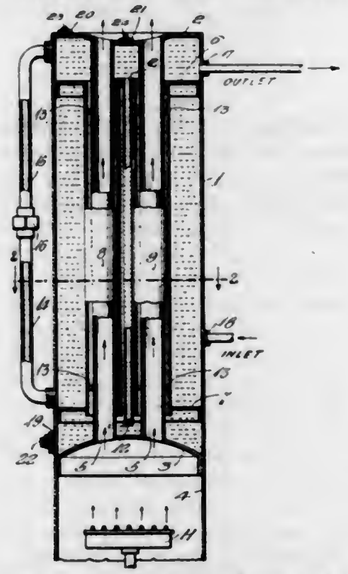
1. High frequency electron discharge apparatus comprising a support, a platform carried by said support, a hollow resonator mounted on said platform, a rigid body of electrical insulating material secured to said platform and electron emitter and deflecting electrode assemblies secured to said body and disposed on opposite sides of said resonator in alignment therewith.



2,408,818
MEDICATED SURGICAL DRESSINGS
Harry Sobotka, New York, N. Y., assignor to Mount Sinai Hospital Research Foundation, Inc., a membership corporation of New York
No Drawing. Application December 18, 1941, Serial No. 423,475
6 Claims. (Cl. 167—84)

1. A surgical dressing material comprising a dry textile material having a feel and flexibility similar to that of untreated surgical gauze and carrying on the fibres thereof an impregnation of a sulfa compound in a proportion at least equalling 5% of the weight of said textile material and a binding agent consisting essentially of a cellulose ether present in an amount sufficient to hold said sulfa compound in situ in said material without leaching during steam sterilization and substantially without dusting during handling while at the same time permitting gradual absorption of said sulfa compound from the dressing when applied to a wound.

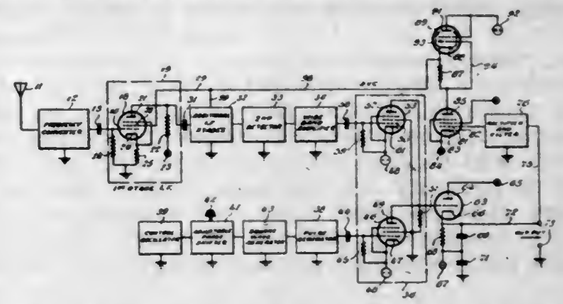
2,408,819
RADIO REMOTE CONTROL SYSTEM
Edward M. Sorensen, Dayton, Ohio
Application May 16, 1940, Serial No. 335,517
10 Claims. (Cl. 250—2)
(Granted under the act of March 3, 1883, as amended April 30, 1928; 370 O. G. 757)



1. In a remote control system, a source of variable wave energy, means for converting said wave energy into voltages proportional to a change in frequency and independent of amplitude, means for translating said voltages into mechanical motion, comprising means responsive to said proportional voltages for governing the response

thereto to effectuate a motion dependent on variations in said voltages, a device to be controlled,

and means responsive to the last named means to control the position of said device.



2,408,820
WATER HEATER AND BOILER
Benjamin I. J. Stamm, New York, N. Y.
Application June 19, 1944, Serial No. 541,006
10 Claims. (Cl. 122—17)

1. A water heater comprising an outer wall and top and bottom walls defining a water containing vessel or tank and a skirt portion defining a compartment adapted to receive a heating element, said tank having a pair of partitions located respectively near the top and bottom of said tank and defining a large central chamber and smaller chambers at the top and bottom of said tank, said top and bottom walls being connected by a plurality of heating flues, said partitions being connected by water confining tubes, said tubes being arranged in closely spaced relation about companion flues, said partitions being also connected with a down-flow tube in direct communication with the upper and lower chambers and an up-feed pipe supported by said heater making direct communication with the upper chamber and the lower portion of the central chamber, in combination with a feed water inlet connected to the central chamber and a dispensing outlet connected with the upper chamber.

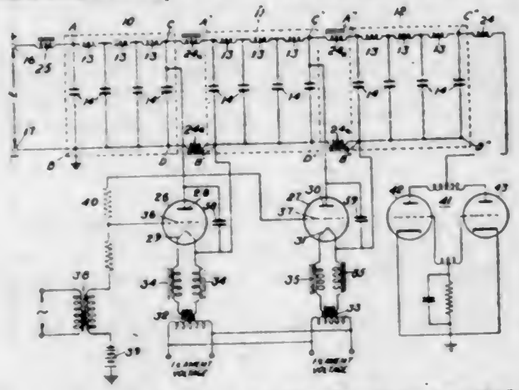
2,408,821
AUTOMATIC VOLUME CONTROL
Horace Myrl Stearns, Merrick, N. Y., assignor to Sperry Gyroscope Company, Inc., Brooklyn, N. Y., a corporation of New York
Original application July 30, 1942, Serial No. 452,818. Divided and this application November 6, 1943, Serial No. 509,225
16 Claims. (Cl. 250—20)

11. An automatic volume control system for a signal receiver including a screen grid amplifier, comprising a source of potential, a power tube forming a dropping resistor for connecting the screen grid of said amplifier to said source of potential, and control means connected in series

with said power tube and responsive to the average output level of the receiver for controlling the resistance of said power tube to change the voltage applied to said screen grid in a manner to stabilize the output of said receiver.

2,408,822
ELECTRICAL DISCHARGE DEVICE
Hubert E. Tanis, Jr., Schenectady, N. Y., assignor to General Electric Company, a corporation of New York
Application July 30, 1942, Serial No. 452,834
8 Claims. (Cl. 250—27.5)

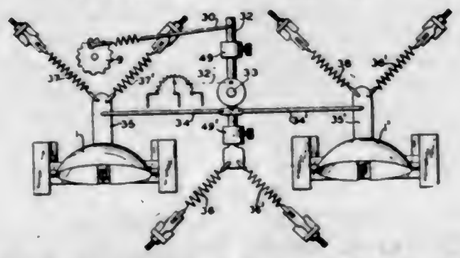
8. A discharge device comprising at least two conductive parts separated by an insulating member having a water-repellent, externally exposed surface portion obtained by treating the externally exposed surface portion of said member with a methyl-silicon halide in vapor form.



2,408,823
MANUFACTURE OF SULPHAMIC ACID
Ernest J. Tauch, Cleveland Heights, Ohio, assignor to E. I. du Pont de Nemours & Company, Wilmington, Del., a corporation of Delaware
No Drawing. Application July 21, 1944, Serial No. 546,065
15 Claims. (Cl. 23—166)

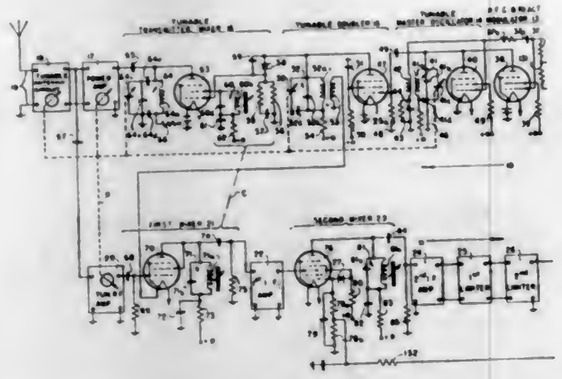
4. In the manufacture of sulphanic acid the steps of bringing together urea and liquid sulphur trioxide in the proportions of at least 6 parts of liquid sulphur trioxide for each part of urea and effecting the reaction under such conditions that there is no substantial loss of sulphur trioxide from the reaction vessel during said reaction while agitating and cooling sufficient to maintain a temperature below about 80° C., thereafter introducing sulphuric acid in the proportion of one mole of sulphuric acid for each mole of urea and thereafter heating to a temperature between about 75° C. and about 120° C.

2,408,824
IMPULSE GENERATOR
Arthur A. Varela, Washington, D. C.
Application March 27, 1942, Serial No. 436,483
26 Claims. (Cl. 171—97)
(Granted under the act of March 3, 1883, as amended April 30, 1928; 370 O. G. 757)



21. An electrical impulse generator comprising a plurality of artificial lines each having a plurality of serially connected inductance means

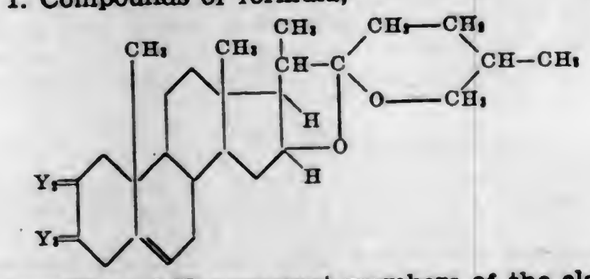
with a plurality of capacitance means connected in parallel relation therewith, each of said lines having high and low potential input and output terminals, means interconnecting said lines in parallel relation, means applying a source of potential to the input terminals of the first line of said parallel connected lines for charging the capacitance means included in said lines in parallel relation, a discharge circuit having an impedance connected between the output of the last line of said parallel connected lines and said first line, a plurality of discharge devices having a rotary electrode and a pair of stationary electrodes associated with said rotary electrode, means connecting one of the stationary electrodes



of each of said devices to the high potential output terminal of certain of said lines and the other stationary electrode of each of said devices to the low potential input terminal of the next line of said parallel connected lines, an electrical grounded rotating shaft for simultaneously rotating said rotary electrodes at a predetermined speed for progressively discharging said devices whereby said lines are periodically serially discharged through said discharge circuit for periodically producing a substantially constant potential across said impedance for a period of time determined by the electrical lengths of said lines, and capacitance means positioned between said shaft and said rotary electrodes for synchronizing discharge of said devices.

2,408,825
OBJECT DETECTING AND LOCATING SYSTEM
Russell H. Varian, Wantagh, and William W. Hansen and John R. Woodyard, Garden City, N. Y., assignors to The Board of Trustees of the Leland Stanford Junior University, Stanford University, Calif., a corporate body of California
Original application September 30, 1941, Serial No. 412,918. Divided and this application March 25, 1943, Serial No. 480,574
6 Claims. (Cl. 250—11)

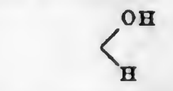
1. In an apparatus of the character described a plurality of pivotally mounted reflectors, means for oscillating said reflectors about their pivotal mountings, and inertia means connected to said oscillating means for counteracting the inertia of said reflectors, whereby vibration of the system is substantially eliminated.



2,408,826
COMBINED FREQUENCY MODULATION RADIO TRANSMITTER AND RECEIVER
William W. Vogel, Chicago, Ill., assignor to Galvin Manufacturing Corporation, Chicago, Ill., a corporation of Illinois
Application June 21, 1943, Serial No. 491,595
21 Claims. (Cl. 250—13)

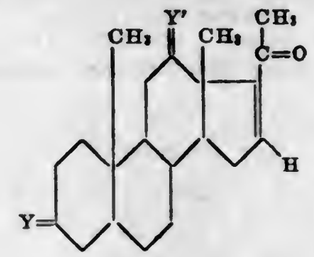
1. In a combined radio transmitting and receiving system which includes means for selectively conditioning said system for signal transmission or reception, a receiving channel, a signal responsive device operative in response to the transmission of a received signal through said channel, muting means responsive to noise voltages appearing in said channel in the absence of a received signal and having frequencies different from the frequencies of received signals transmitted through said receiving channel to prevent said signal responsive device from responding to the noise voltage, a transmission channel including a master oscillator, and means comprising a second oscillator associated with said transmission channel at a point following said master oscillator for controlling said master oscillator through a section of said receiving channel to govern the output frequency of said master oscillator and for controlling said muting means through the same section of said receiving channel to render said muting means inoperative to prevent noise or signal voltages from being transmitted to said signal responsive device.

2,408,827
STEROIDAL COMPOUNDS AND METHODS FOR OBTAINING THE SAME
Romeo B. Wagner, State College, Pa., assignor to Parke, Davis & Company, Detroit, Mich., a corporation of Michigan
No Drawing. Application May 15, 1944, Serial No. 535,748
4 Claims. (Cl. 260—239.5)



1. Compounds of formula,

where Y_2 and Y_3 represent members of the class

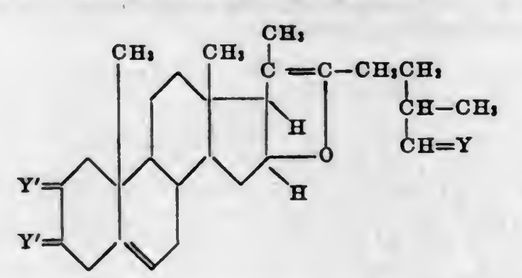


and ester groups hydrolyzable to

2,408,828
STEROIDAL COMPOUNDS AND METHOD FOR OBTAINING THE SAME
Romeo B. Wagner, State College, Pa., assignor to Parke, Davis & Company, Detroit, Mich., a corporation of Michigan
No Drawing. Application May 15, 1944, Serial No. 535,749
4 Claims. (Cl. 260—397.3)

1. A compound represented by the following formula:

where Y and Y′ are members of the class



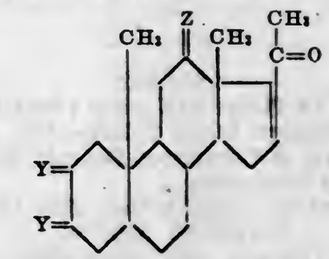
groups hydrolyzable to

and =O.

2,408,829
STEROIDAL COMPOUNDS AND METHODS FOR OBTAINING THE SAME
Romeo B. Wagner, State College, Pa., assignor to Parke, Davis & Company, Detroit, Mich., a corporation of Michigan
No Drawing. Application May 15, 1944, Serial No. 535,753
5 Claims. (Cl. 260—239.5)

1. Compounds having the formula,

where Y and Y′ are members of the class



and groups hydrolyzable to

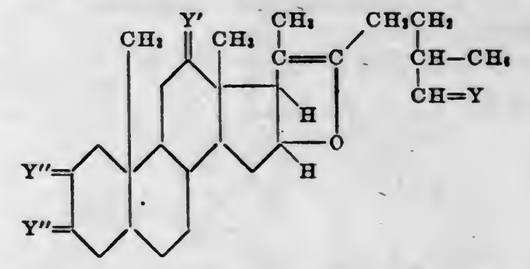
2,408,830
STEROIDAL COMPOUNDS AND METHODS FOR OBTAINING THE SAME
Romeo B. Wagner, State College, Pa., assignor to Parke, Davis & Company, Detroit, Mich., a corporation of Michigan
No Drawing. Application May 15, 1944, Serial No. 535,754
11 Claims. (Cl. 260—397.4)

1. A compound of the formula

where Y is a member of the class

and groups hydrolyzable to

and Z is a member of the class



groups hydrolyzable to

and =O.

2,408,831
STEROIDAL COMPOUNDS AND METHODS FOR OBTAINING THE SAME
Romeo B. Wagner, State College, Pa., assignor to Parke, Davis & Company, Detroit, Mich., a corporation of Michigan
No Drawing. Application May 15, 1944, Serial No. 535,755
8 Claims. (Cl. 260—239.5)

1. Compounds of the formula,

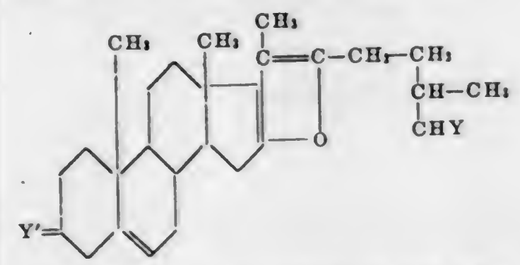
where Y and Y″ are in each case members of the class

and groups hydrolyzable to

and Y' is a member of the class =O,

and groups hydrolyzable to

2,408,832



PSEUDOKRYPTOGENIN AND ITS DIACETATE

Romeo B. Wagner, State College, Pa., assignor to Parke, Davis & Company, Detroit, Mich., a corporation of Michigan

No Drawing. Application May 15, 1944, Serial No. 535,756

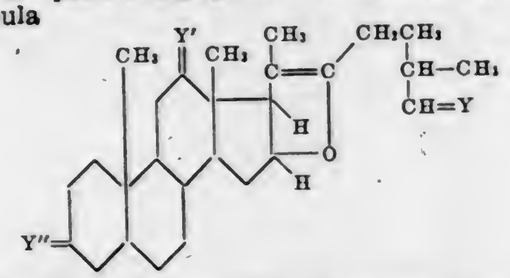
4 Claims. (Cl. 260—239.5)

1. Compounds having the formula,

where Y and Y' are members of the class consisting of

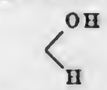
and groups hydrolyzable to

2,408,833



STEROIDAL COMPOUNDS AND METHODS FOR OBTAINING THE SAME

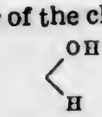
Romeo B. Wagner, State College, Pa., assignor to Parke, Davis & Company, Detroit, Mich., a corporation of Michigan



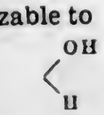
No Drawing. Application May 15, 1944, Serial No. 535,757

9 Claims. (Cl. 260—239.5)

1. A pseudo-sapogenin compound of the formula



where Y and Y'' are members of the class

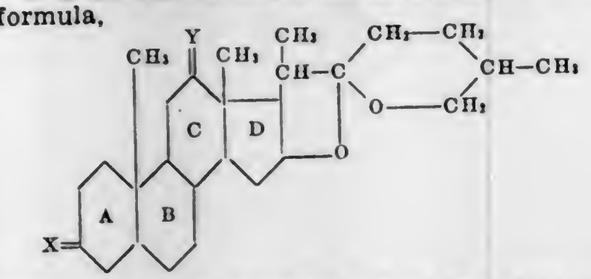


and groups hydrolyzable to

and Y' is a member of the class O,

and groups hydrolyzable to

2,408,834

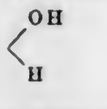


STEROIDAL COMPOUNDS AND METHODS FOR OBTAINING THE SAME

Romeo B. Wagner, State College, Pa., assignor to Parke, Davis & Company, Detroit, Mich., a corporation of Michigan

No Drawing. Application May 15, 1944, Serial No. 535,758

5 Claims. (Cl. 260—239.5)

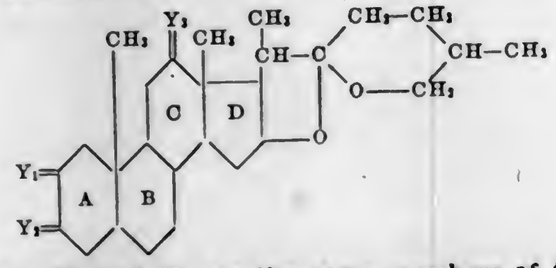


1. A C_{12}-substituted steroidal sapogenin of the formula,

where X and Y are members of the class =O,

and ester groups hydrolyzable to

2,408,835



STEROIDAL COMPOUNDS AND METHODS FOR OBTAINING THE SAME

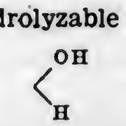
Romeo B. Wagner, State College, Pa., assignor to Parke, Davis & Company, Detroit, Mich., a corporation of Michigan

No Drawing. Application May 15, 1944, Serial No. 535,759

7 Claims. (Cl. 260—239.5)

1. A ring saturated C_{12}-substituted steroidal sapogenin of the fromula

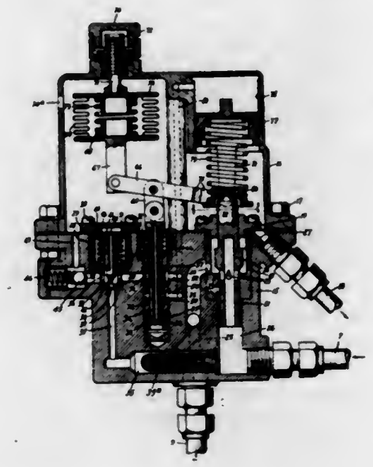
where Y_1 and Y_2 are the same members of the class consisting of



and ester groups hydrolyzable to

and Y_3 is a member of the class consisting of =O,

and ester groups hydrolyzable to



2,408,836

BAROMETRIC FUEL VALVE

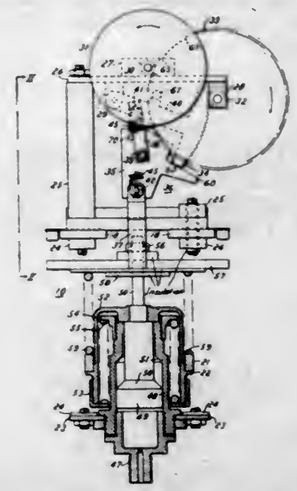
Donald F. Warner, Swampscott, Mass., assignor to General Electric Company, a corporation of New York

Application April 12, 1944, Serial No. 530,718

2 Claims. (Cl. 137—153)

1. A barometric valve structure of the character described comprising a base, a cap fixed on the base to provide a chamber above the base, a pressure control valve in the base having a stem projecting into said chamber, a cylinder in the cap, a piston in the cylinder, a loading spring between the piston and the valve stem, walls which define a passage connecting the region on the admission side of said control valve to said cylinder, a pressure reducing valve in said passage, a pilot valve in the passage beyond said reducing valve which controls flow of fluid to said cylinder, and a means responsive to barometric pressure for positioning said pilot valve.

2,408,837



SWITCHING MEANS

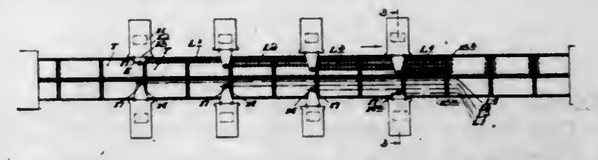
Charles C. Whittaker, Pittsburgh, Pa., assignor to Westinghouse Electric Corporation, East Pittsburgh, Pa., a corporation of Pennsylvania

Application March 18, 1944, Serial No. 527,050

7 Claims. (Cl. 200—35)

1. A pneumatically operated time limit switch, in combination, a cylinder, a piston provided with a rod disposed within the cylinder, means for supplying gas under pressure to the cylinder to operate the piston, stationary contacts, a movable contact, slidably mounted on the piston rod, for bridging the stationary contacts, a toggle mechanism coupled to the movable contact, a spring coacting with the piston and movable contact to bias the movable contact toward the stationary contact upon operation of the piston, and time-limit means operable after a given movement of the movable contact toward the stationary contacts for breaking the toggle mechanism to thus release the movable contact so that it

makes rapid contact with the stationary contacts.



2,408,838

CONVEYER LOADING MECHANISM

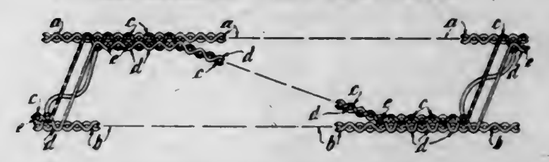
Eibe A. Wilckens and Ellis M. Magill, Baltimore, Md., assignors to Crown Cork & Seal Company, Inc., Baltimore, Md., a corporation of New York

Application December 23, 1941, Serial No. 424,174

14 Claims. (Cl. 226—2)

1. In an apparatus of the character described, a conveyer, a plate element above the conveyer having a cut-out therein substantially corresponding to the outline of the articles being handled, means to move articles on the plate to the cut-out so that they will drop upon the conveyer, means associated with the cut-out to support articles within the same, and means to intermittently move said last-named means out of article supporting position to enable the articles to drop upon the conveyer.

2,408,839

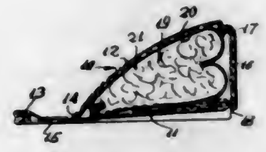


LADDER WEBBING

George Frederick French, Manchester, England, assignor to Roger French, Manchester, England, and himself

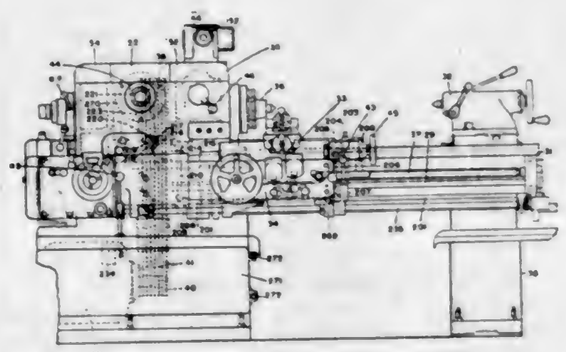
Application June 26, 1939, Serial No. 281,228

In Great Britain April 6, 1939



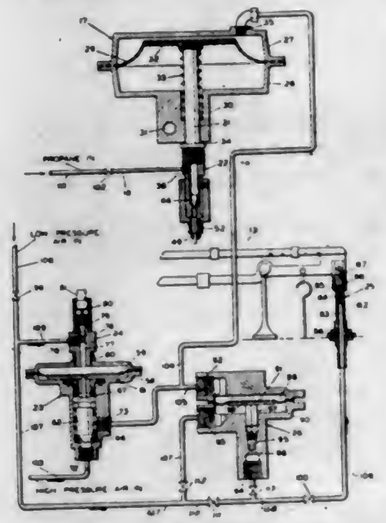
13 Claims. (Cl. 139—384)

1. Ladder webbing comprising two outer bandings and joining cross-straps, wherein the outer bandings are of different colours, and wherein one portion of the cross-strap warps is of one colour agreeing with the colour of one banding, and the other portion is of another colour agreeing with the colour of the other banding, and wherein at a binding-in of a strap to a banding, the strap warps of like colour to the banding are



interwoven with such banding, whilst the other strap warps are only bound to the inner face of the banding, no portion of the cross-strap warps of one colour showing through the banding of the other colour.

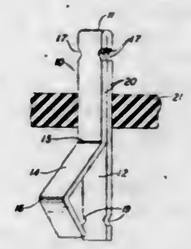
2,408,840
REMOVABLE SHOULDER PAD
Abraham Friedman, New York, N. Y.
Application October 7, 1944, Serial No. 557,603
1 Claim. (Cl. 2—268)



A removable shoulder pad, comprising a pocket-like casing having a flange portion extending along the sides at one end and at the other end having a vertical end-wall meeting the base wall of said casing forming a mouth for said casing, a pad filler within said casing and engaging said vertical end wall and removable through said mouth, and releasable fastening elements mounted on said flange for engaging complementary fastening elements formed on a garment for holding the shoulder pad in position, said pad filler comprising an outer casing, and filler material within said casing.

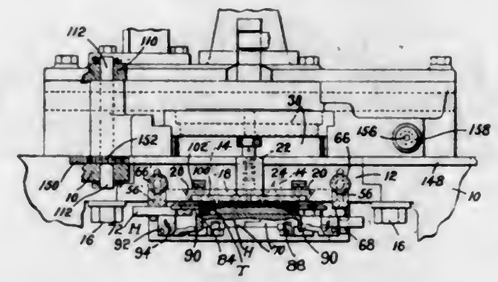
2,408,841
MACHINE TOOL STRUCTURE
Frank A. Fritzsch, Cincinnati, Ohio, assignor to The Lodge & Shipley Machine Tool Company, Cincinnati, Ohio, a corporation of Ohio
Application September 28, 1943, Serial No. 504,134
13 Claims. (Cl. 82—29)

1. In a device of the class described, a headstock assembly, comprising in combination a two-piece spindle including a main and an auxiliary spindle, a spindle drive pulley, means for independently mounting said spindles in an end to end relationship for rotation about a common axis, means for mounting said spindle drive pulley independently of and for rotation relative to said main spindle, means operable for connecting said pulley in driving relationship with said main spindle, means operable for connecting said auxiliary spindle in driven relationship with said main spindle, and means for mounting said auxiliary spindle for axial movement relative to said main spindle to a position in engagement therewith, or to a position spaced therefrom for providing access to said drive pulley from a location between said spindles.



2,408,842
AUTOMATIC CYLINDER FILLING DEVICE
Owen L. Garretson, Bartlesville, Okla., and Theodore A. St. Clair, Pontiac, and Andrew R. Olson, Detroit, Mich., assignors to Phillips Petroleum Company, a corporation of Delaware
Application June 22, 1942, Serial No. 448,022
20 Claims. (Cl. 249—63)

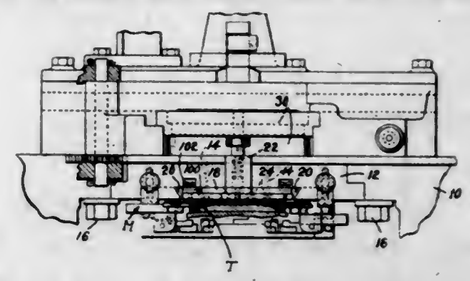
1. Apparatus for filling cylinders each of said cylinders having an inlet and a check valve controlling said inlet, with a predetermined standard weight of fluid, comprising in combination cylinder weighing means, a fluid dispensing line for filling said cylinders with fluid, means for positioning one of said cylinders so that it is weighed by the cylinder weighing means and is aligned for connection to said fluid dispensing line, connecting means for connecting said line to said cylinder and for opening said check valve, disconnecting means urging said connecting means away from and out of connection with said cylinder, power operated means for overcoming said disconnecting means and for connecting said fluid line and said cylinder by said connecting means, pressure responsive means normally operative to render said power operated means inoperative, manually controlled means for rendering said pressure responsive means inoperative at will, weight controlled means for rendering said pressure responsive means operative upon the cylinder being filled with the standard weight of fluid to render said power operated means inoperative, and means preventing more than one such operation of said weight controlled means between any two manual actuations of said manually controlled means whereby random operation of said power operated means is prevented, said connecting means comprising a check valve controlling flow of fluid from the dispensing line, said check valves being opened by said connecting means at the time of connection of said line to said cylinder whereby loss of fluid into the atmosphere is prevented.



2,408,843
ELECTRICAL CONNECTOR
Marcel C. Gauthier, Montclair, N. J., assignor to Western Electric Company, Incorporated, New York, N. Y., a corporation of New York
Application December 1, 1943, Serial No. 512,436
1 Claim. (Cl. 173—324)

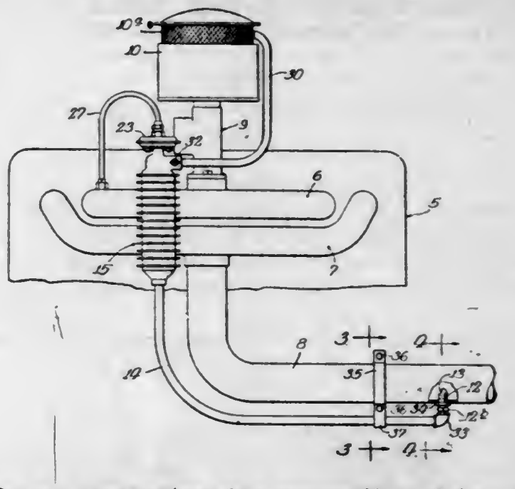
An electrical connector comprising a body formed of a strip of conductive material notched adjacent one end to form a single terminal portion, a length of the material near the other end being bent at spaced positions to form an angular resilient contact portion, the material of the body also being bent back on itself intermediate the single terminal portion and the contact portion

to form a double terminal portion, with aligned notches therein near the last mentioned bend, and to position the free ends of the contact portion and the single terminal portion in a common plane at spaced positions from each other.



2,408,844
HOLDER AND POSITIONER FOR HEEL PARTS
Emerson C. Gill, Melrose, Mass., assignor to United Shoe Machinery Corporation, Flemington, N. J., a corporation of New Jersey
Application December 12, 1942, Serial No. 468,774
5 Claims. (Cl. 1—32)

1. In a heel-attaching machine having fastening-inserting mechanism provided with fastening-receiving passages and coöperating fastening-drivers arranged in accordance with an inserting design, the combination of a pair of pivoted base-engaging arms, a pair of pivoted lift-engaging arms, and means for yieldably forcing the arms of each pair toward each other, the pairs of arms being located one above the other and each pair being provided with projections arranged to contact with a base or lift to locate it in a direction from front to rear of the inserting design of the fastening-inserting mechanism and by their lateral pressure to turn it about an axis heightwise of the heel-parts into a predetermined angular relation to the said design and to the associated heel-part.

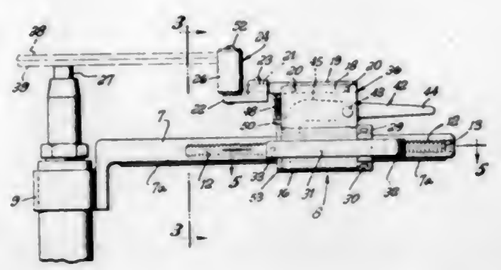


2,408,845
FASTENING-INSERTING MACHINE
Emerson C. Gill, Melrose, Mass., assignor to United Shoe Machinery Corporation, Flemington, N. J., a corporation of New Jersey
Original application December 12, 1942, Serial No. 468,774. Divided and this application July 12, 1944, Serial No. 544,495
6 Claims. (Cl. 1—32)

1. In a heel-attaching machine, a heel-abutment provided with a projection against which the work is pressed, and a yieldable guard having a contracted opening within which the projection normally lies, said guard presenting to heel-ports about the opening an extended plane surface for engagement with the tread-surfaces

of said heel-parts during their introduction into the machine.

2,408,846
ANTIDETONATION APPARATUS FOR AUTOMOTIVE ENGINES
Lucius Duke Golden and James Kirk Gregg, Richmond, Ind., assignors to The Perfect Circle Company, Hagerstown, Ind., a corporation of Indiana
Application June 19, 1944, Serial No. 540,972
4 Claims. (Cl. 123—119)



2. In an apparatus for preventing detonation in an automotive vehicle internal combustion engine having an exhaust and an intake system including a manifold, carburetor and air filter, the combination of means including a silencer, a pipe connecting the silencer to the exhaust system, and a pipe leading from the silencer to the filter and adapted to deflect and conduct a portion of the exhaust gases from the exhaust system to the filter, a valve normally closing said conducting means, and a diaphragm device connected at one side to the valve, a pipe connecting the other side of the diaphragm device to the intake manifold so that the diaphragm device is controlled by the vacuum in the manifold to open the valve only when detonation is likely to occur and thus permit a quantity of the exhaust gases to be mixed with the explosive mixture of the engine and thereby prevent detonation.

2,408,847
SPOT-WELD EDGE GAUGE
Bernard Gross and Leo W. Cornwall, San Diego, Calif., assignors to Rohr Aircraft Corporation, Chula Vista, Calif., a corporation of California
Application November 21, 1945, Serial No. 629,948
6 Claims. (Cl. 219—4)

1. A spotweld edge gauge, comprising a rod, means for securing one end of said rod to a spot-

welding machine adjacent to one of the electrodes thereof, an edging roller assembly and carriage therefor mounted upon said rod to slide

thereon toward and from said electrode, and means for detachably clamping said assembly to said rod in adjusted position thereon.

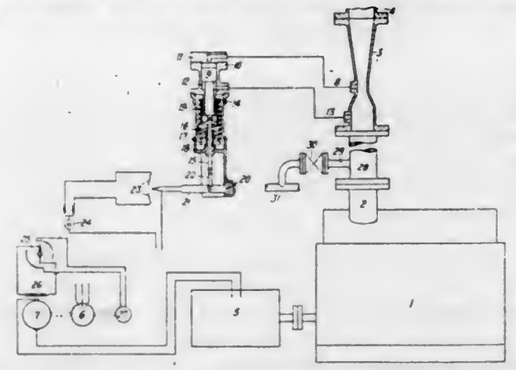
2,408,848
NAVIGATIONAL GUIDE SYSTEM
John Hays Hammond, Jr., Gloucester, Mass., assignor to Radio Corporation of America, a corporation of Delaware
Application February 5, 1943, Serial No. 474,773
12 Claims. (Cl. 250—1)

8. A navigational guide system for a vessel, comprising a plurality of sources of different directional radio beams on said vessel each adapted to be rotated to sweep an area, frequency modulation means for modulating each of said sources to cause said beams to vary in frequency in a predetermined manner, a plurality of remote reflectors in said area comprising two groups, each group being selective only to one of said beams and adapted to reradiate the same when energized thereby, said reflectors constituting left and right course markers having different reradiating characteristics, a plurality of receivers on said vessel each responsive to said reradiated beams having one of said characteristics and including circuits responsive to the time lag between said radiated and said corresponding reradiated beams, and indicating mechanism actuated by said circuits, said indicating mechanism having means to indicate both the direction of each of said reradiated beams and the distance of each of said reflectors from said vessel.

2,408,849
CELLULOSE PURIFICATION
Clifford I. Haney, Greenwich, Conn., and Mervin E. Martin and Troy Monroe Andrews, Cumberland, Md., assignors to Celanese Corporation of America, a corporation of Delaware
No Drawing. Application March 12, 1943, Serial No. 478,910
2 Claims. (Cl. 8—105)

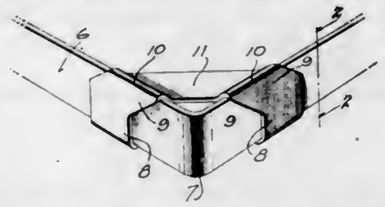
1. Process for the treatment of sulfite wood pulp, which comprises forming a slurry comprising 8% by weight of sulfite wood pulp in a 7% aqueous solution of sodium hydroxide, digesting said slurry at a temperature of about 90 to 103° C. for about 1 hour, treating said digested slurry with a 2% aqueous solution of chlorine for about 30 minutes, subjecting said treated slurry to a plurality of treatments with aqueous solutions of sodium hydroxide at a temperature between 50 and 60° C. and aqueous solutions of chlorine, said aqueous solutions of sodium hydroxide and of chlorine being of lower concentration than the aqueous solutions employed in the initial treatment therewith and said aqueous solutions being used for at least 30 minutes, subjecting the so-treated pulp to a bleaching treatment with an aqueous solution of hypochlorite containing 0.5% available chlorine, subjecting said bleached pulp to a treatment with a 7% aqueous solution of sodium hydroxide at a temperature between 75 to 103° C., and then washing and drying said pulp.

2,408,850
CORDED TAPE
James A. Hendley, Middletown, Conn., assignor to The Russell Manufacturing Company, Middletown, Conn., a corporation of Connecticut
Application February 1, 1944, Serial No. 520,634
11 Claims. (Cl. 139—384)



1. A corded tape for slide-fasteners and the like, including: a relatively-thin tape-body having interwoven longitudinal warp strands and transverse weft strands; and a relatively-thick cord extending longitudinally adjacent one edge of said tape-body and having a plurality of longitudinal twisted cord-strands with at least some of said weft strands extending transversely through approximately the middle of said cord with a plurality of the cord-strands on each side of said transversely-extending weft strands, and each of said cord-strands extending helically of said cord substantially throughout the length of said cord.

2,408,851
PUMP
Harold Hillier and Thomas McAlpine, Cathcart, Glasgow, Scotland, assignors to G. & J. Weir Limited, Glasgow, Scotland, a corporation of Great Britain
Application September 22, 1944, Serial No. 555,235
In Great Britain October 12, 1943
2 Claims. (Cl. 103—35)

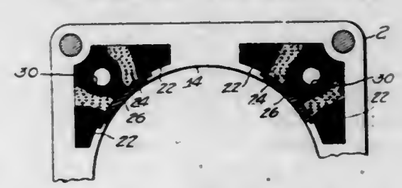


1. An apparatus for controlling the delivery pressure of a liquid pump at a predetermined

value for each and every given rate of flow of the pump, comprising a cylinder, a piston reciprocable in said cylinder, one end portion of said piston being of larger diameter than the other, the end portion of smaller diameter extending through the adjacent end of the cylinder and being exposed to atmospheric pressure, said piston having an annular portion complementary to said portion of smaller diameter, a spring operative to oppose outward movement of the smaller end portion of the piston, a Venturi nozzle through which discharge from the pump passes, a conduit connecting the space in the end of the cylinder opposite the free end of the larger portion of the piston with a region of low pressure in the Venturi nozzle, a conduit connecting the space in the other end of the cylinder in which the an-

nular portion of the piston reciprocates with a region of high pressure in the Venturi nozzle, whereby variations of pressure in said regions will cause movement of the piston in the cylinder, a rotary motor member connected to the pump, and means operated by movement of the piston to control the speed of the rotary motor member and thereby to control the pump from a given pressure datum against the atmosphere, the proportions of the Venturi nozzle, the larger and smaller diameters of the piston, and the characteristic of the spring being such with respect to a rising pressure capacity characteristic desired from the pump that the piston is stationary in a predetermined position for any given liquid flow at the corresponding discharge pressure of the pump on the pressure capacity characteristic.

2,408,852
FRAME CORNER STRUCTURE
William Holman and Gustave Holman, Sheboygan, Wis.
Application November 24, 1943, Serial No. 511,640
5 Claims. (Cl. 189—34)

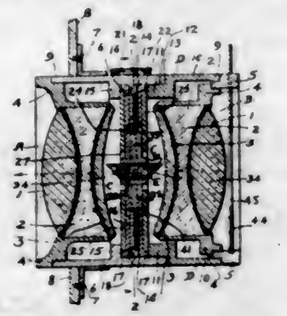


1. In a frame corner structure, the combination with strap metal frame sides connected at right angles to comprise a corner and having external and internal faces and disposed so that their edge portions form top and bottom margins, of a metal strap bracket diagonally spanning the top margins of such sides across the angle therebetween and in spaced relation to the corner, the ends of said strap bracket extending downwardly in face contact with the external faces of the respective frame sides and thence beneath the lower margins thereof and upwardly in substantial face contact with the interior faces of the respective frame sides, said frame sides and strap bracket having integral portions mechanically interlocked against movement of said bracket toward the corner of the frame sides, whereby to secure the bracket independently of extraneous fastening means.

2,408,853
GUAYULE RUBBER BY FERMENTATION
Samuel R. Hoover, Philadelphia, Pa., Paul J. Allen, Robles del Rio, Calif., and Joseph Naghski, Philadelphia, Pa., assignors to the United States of America as represented by the Secretary of Agriculture
No Drawing. Application July 21, 1944, Serial No. 546,020
4 Claims. (Cl. 195—1)
(Granted under the act of March 3, 1883, as amended April 30, 1928; 370 O. G. 757)

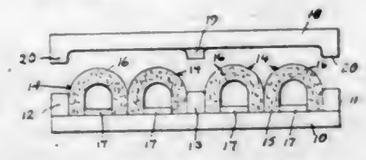
2. The process of producing an improved rubber from guayule rubber worms, comprising suspending the worms in water, inoculating the mixture with *Pseudomonas boreopolis* organisms, conditioning the medium for growth of the organisms, allowing the organisms to grow until the resin content of the worms is substantially decreased, whereby the physical properties of the rubber will be improved, then removing and washing the improved rubber and drying it.

2,408,854
STATOR FOR ELECTRIC MACHINES
Vaino A. Hoover, Los Angeles, Calif., assignor to Electrical Engineering and Manufacturing Corporation, Los Angeles, Calif., a corporation of California
Application November 6, 1943, Serial No. 509,292
3 Claims. (Cl. 172—36)



1. A stator for an electric motor, comprising a frame member having a continuous peripheral part defining a central opening and having a plurality of pole pieces extending inwardly from the peripheral part, each of said pole pieces having a circumferentially elongated, arcuate face part connected centrally thereof to the peripheral part by a part of less circumferential extent than the face part, whereby a recess is provided on each side of the connecting part behind the face part, and windings coiled about said connecting part and being partially within the recesses behind the face part and substantially filling the space between adjacent pole pieces, and means for ventilating said windings comprising a hollow tube extending longitudinally of the stator and being disposed between the windings of adjacent pole pieces.

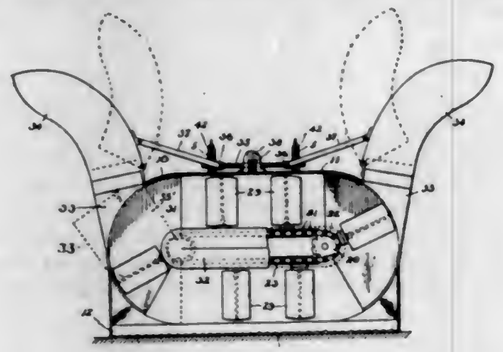
2,408,855
IMAGE REVERSER FOR CAMERAS
William C. Huebner, New York, N. Y.
Application February 14, 1945, Serial No. 577,812
4 Claims. (Cl. 88—57)



1. In an optical system for straight line cameras, the combination of a lens barrel, a lens sys-

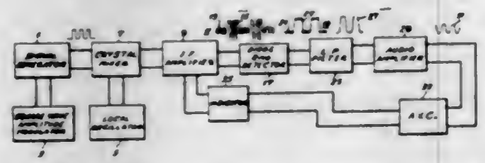
tem within said barrel comprising lens elements spaced apart, an image reversing prism disposed between the nodal points of said lens elements and in the optical axis of said lens system, a circular frame rotatable in the barrel in a plane normal to the optical axis of the lens system and

having a centrally disposed recess, a mounting for said prism radially shiftable in the recess for adjusting the prism relatively to the said optical axis, and diametrically opposite screws in said circular frame bearing upon said mounting for shifting the mounting.



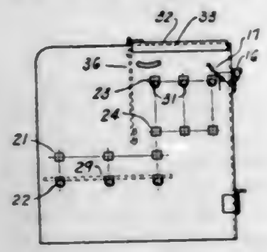
2,408,856
VIBRATION ABSORBING SUPPORT
Carl Hussman, Chicago, Ill.
Application May 18, 1944, Serial No. 536,075
3 Claims. (Cl. 248—22)

1. A vibration absorbing structure comprising a pair of spaced apart upper and lower plates, said lower plate being provided with spacer members on the upper surface thereof, upstanding stabilizer members on the lower plate disposed parallel with said spacer members, depending parallel stabilizer members on said upper plate each arranged in the respective vertical plane of one of said upstanding stabilizer members on the lower plate, and a plurality of flexible inverted U-shaped vibration absorbing strips each having vertical legs resting on said lower plate on opposite sides of one of said spacer members and each strip contacting at one vertical side of one leg thereof one of said stabilizer members of each plate and at the opposite vertical side having mutual supporting contact with an adjacent side of another of said strips, said strips supporting said upper plate at an elevation above the lower plate to preclude contact of the upper stabilizing members with the respective lower stabilizing members when said upper plate is subjected to the influence of a vibration generating load supported by said upper plate.



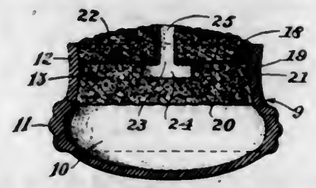
2,408,857
SNOWPLOW
Norman L. James, Ingersoll, Ontario, Canada
Application November 15, 1943, Serial No. 510,408
In Canada November 19, 1942
3 Claims. (Cl. 37—45)

1. A snow plow comprising a frame having a closed vertical back mounted transversely of a truck, horizontally spaced shafts arranged adjacent to opposite ends of said frame, paired sprockets mounted on each of said shafts, an endless chain belt extending between and operated by the sprockets on said shafts, said belt having roller extensions engaging said sprockets, paired horizontal trackways rigidly supported from said frame between said sprockets and supporting the



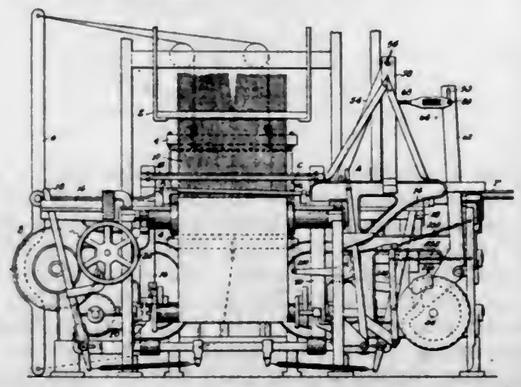
rollers of the upper and lower reaches of said chain, shovel-like cutters mounted at intervals on said chain belt and presenting snow cutting edges, means for guiding the snow into the path of said cutters, and means for directing the snow discharged from said cutters.

2,408,858
ADJUSTMENT AND TESTING OF CRYSTAL RECTIFIERS
Eugene O. Keizer, Princeton, N. J., assignor to Radio Corporation of America, a corporation of Delaware
Application November 29, 1943, Serial No. 512,150
9 Claims. (Cl. 250—20)



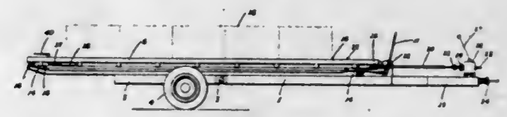
1. The method of testing a microwave detector providing signal and noise output current components comprising employing said detector as a mixer in a microwave superheterodyne circuit, applying unmodulated and modulated microwave currents of different frequencies to said detector, deriving therefrom modulated difference-frequency currents and indicating the efficiency of said detector in terms of the modulation signal-to-circuit noise current ratio of said derived currents.

2,408,859
OUTDOOR COOKING APPARATUS
William E. Leake, Jr., Birmingham, Ala., assignor to W. E. Leake Company, Inc., a corporation of Alabama
Application August 17, 1945, Serial No. 611,174
3 Claims. (Cl. 126—9)



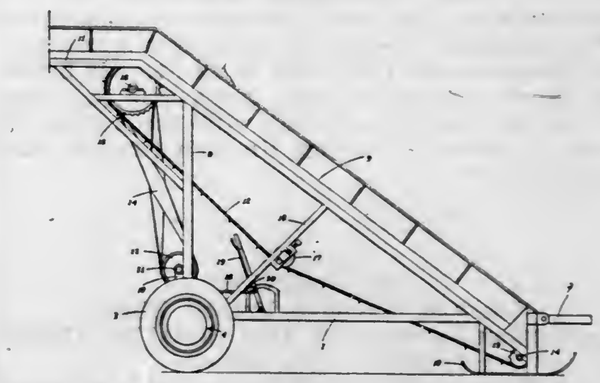
1. An outdoor cooker comprising spaced apart, sheet metal sides each having a plurality of forwardly disposed rows of horizontally aligned spaced holes therein, a plurality of rearwardly disposed rows of horizontally aligned, spaced holes in the sides disposed at a higher elevation than the forwardly disposed holes, a back detachably connecting the sides, a cover over the rearward portion of the apparatus spanning the sides and adjoining the back, and a front hingedly connected to the forward edge of the cover and freely depending downwardly between the sides at the rear of the forwardly disposed rows of holes and in front of the rearwardly disposed upper rows of spaced holes, to form an oven.

2,408,860
FACIAL CLEANER
George L. Lindblad, Chicago, Ill.
Application February 24, 1944, Serial No. 523,719
2 Claims. (Cl. 15—244)



1. A facial cleaner comprising a cup-like member formed of rubber-like material and having substantially straight side walls cooperating to form a sponge receiving section, a sponge secured to the inner surface of the side walls and having an exposed skin engaging surface terminating adjacent the open end of the member, and an impervious flexible membrane provided with an opening dividing said sponge into inner and outer parts, the outer part of said sponge having an unobstructed passage leading from the opening in said membrane to the skin engaging surface of said sponge, the base of said member being collapsible and rounded outwardly from the inner surface of the sponge to form therewith an air pocket, whereby when the sponge is applied to the face, the base may be collapsed and constitute a diaphragm to force the air in the pocket through the sponge without substantially compressing the same and thereby produce a gentle respiratory action upon the skin.

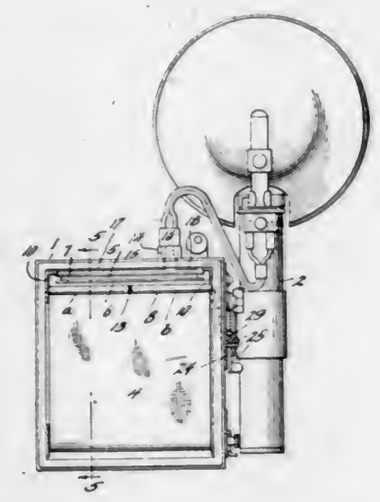
2,408,861
LOOM
Leroy N. Linscott, Yonkers, N. Y., assignor to Alexander Smith & Sons Carpet Company, Yonkers, N. Y., a corporation of New York
Application October 12, 1943, Serial No. 505,912
8 Claims. (Cl. 139—127)



1. In a loom for making a looped pile fabric, pile filler gripping means adjacent one edge of the shed, pile filler severing means adjacent the other edge of the shed, a hollow needle, said needle having an opening intermediate the ends thereof, a plunger positioned in said opening, a plunger-operating cam, means to actuate said cam to depress said plunger to secure the pile filler in said needle, means to move said needle transversely of the shed and present the leading end of the pile filler in position for gripping by said gripping means, means to actuate said gripping means to grip said leading end presented by said needle, means to actuate said plunger-operating cam to withdraw said plunger to release the pile filler from said needle, means to retract the needle to its original position, means to actuate the severing mechanism to sever the pile filler after the needle has been retracted to its original position, and means to actuate said gripping means to release said pile filler.

2,408,862
VEHICLE BED UNLOADING DEVICE
Edward Lisota, Patterson, Calif.
Application June 25, 1945, Serial No. 601,411
1 Claim. (Cl. 214—85)

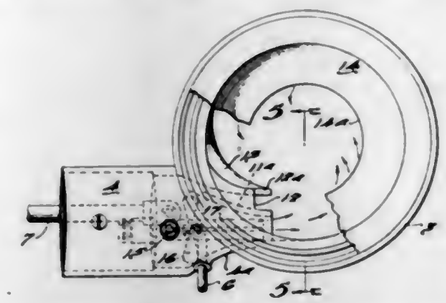
In a vehicle, a longitudinally extending main frame including a front section and a rear section secured together in articulated relation whereby the rear section is rearwardly tiltable, a bed disposed above and supported by the main frame, said bed being fixed to the rear section for rearward tilting therewith, means normally but releasably maintaining the bed against tilting, a load engaging member extending above the bed for movement lengthwise thereof, and power actuated means connected to said member operative to move the same in opposite directions, selectively; said vehicle including transversely spaced supporting wheels journaled in connection with said rear frame section and about the axis of which wheels said rear section pivots upon tilting thereof.



2,408,863
BALED HAY ELEVATOR
Edward Lisota, Patterson, Calif.
Application August 24, 1945, Serial No. 612,330
8 Claims. (Cl. 198—233)

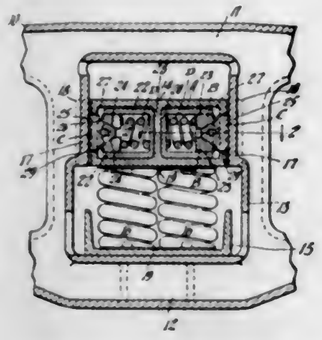
1. Drive mechanism for a baled hay elevating implement which includes an upwardly inclined endless draper mounted on a wheel supported frame, said mechanism comprising an axle driven from one wheel of the implement, an upstanding

member mounted for swinging movement lengthwise of the implement about said axle as an axis, a cross shaft journaled on and movable with said member, an endless drive assembly between the axle and said cross shaft, the member being swingable without interfering with said endless drive assembly, an endless belt drive assembly between the cross shaft and the draper adjacent the upper end of the latter, and means to adjustably position said member whereby to place said endless belt drive assembly in or out of operation, selectively.



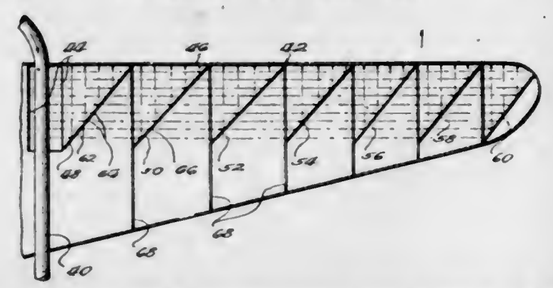
2,408,864
FLASH SYNCHRONIZER FOR FOCAL-PLANE SHUTTERS
Frank J. Longbottom, Philadelphia, Pa.
Application November 6, 1944, Serial No. 562,105
6 Claims. (Cl. 67—29)

2. A synchronized flash mechanism for a focal plane camera having metal protecting strips along the edges of its several windows and a flash gun; in combination with a metal roller mounted near the top of the camera and in physical contact with the back of the focal plane curtain, the roller provided with an insulated gap between its ends, an electric socket, and the ends of the roller electrically connected with said socket, the socket adapted to receive the lead wires from the flash gun, an electric safety switch also in the circuit between the roller and the flash gun, the said switch adapted to be automatically closed on the release of the curtain and the leading metal strip extending along the edge of a pre-determined window and adapted to electrically bridge the gap in the roller when contacting the same on its downward movement with the curtain to thus complete the circuit through the gun and fire the same.



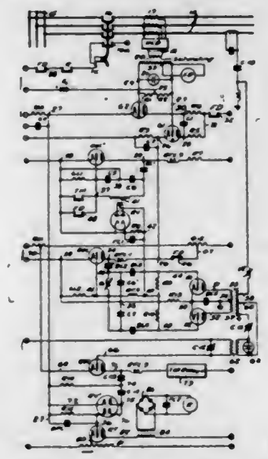
2,408,865
OIL BURNER
Henry D. Mackaye, Detroit, Mich.
Application February 23, 1945, Serial No. 579,423
7 Claims. (Cl. 158—28)

1. A pot-type oil burner comprising a substantially cylindrical open top pot lined with fire glazed sillimanite, an annular refractory cover for said pot formed of glazed fired sillimanite and having a flange extending upwardly and outwardly from the central opening to the circumference thereof, a fuel feeding duct, a nozzle for discharging a stream of a liquid hydrocarbon fuel into said duct, said duct having a passage of reduced size near its mouth to provide for an accelerated rate of discharge of a fuel and air stream from the mouth thereof, a separate air feeding duct, said ducts each having a discharge port communicating with the interior of said pot and arranged to discharge separate streams of products of combustion and air on lines substantially tangent to the inner circumference of said pot, a power driven fan connected with said ducts and adapted to supply air under pressure thereto, a fuel and air mixing device lo-



cated within said first named duct and comprising a rotatable air driven blade type impeller located in said duct adjacent the point of fuel discharge and adapted to break up a fuel stream discharged thereon through said nozzle and admix the broken up fuel stream with sufficient air to provide a primary combustible mixture, an ignitor located in said duct adjacent said impeller and adapted to ignite the primary mixture within said duct to effect initial combustion of said primary mixture within said duct, the gaseous products of said initial combustion upon entry into said pot admixing with air from said air duct.

2,408,866
RAILWAY CAR TRUCK
Leonard A. Marquardt, Elmhurst, Ill., assignor to W. H. Miner, Inc., Chicago, Ill., a corporation of Delaware
Application May 29, 1943, Serial No. 489,017
7 Claims. (Cl. 105—197)



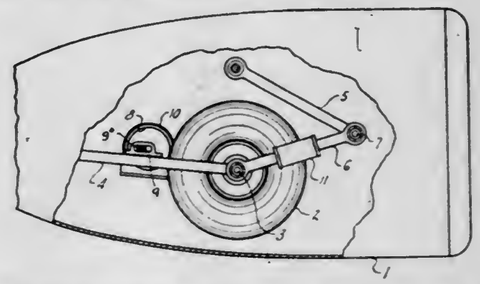
7. In a railway car truck, including a truck side frame having vertical bolster guides thereon, the combination with a bolster presenting an interior chamber at one side thereof; of a friction unit within said chamber, said unit including a pair of sliding wedge blocks, and a friction shoe between the blocks of said pair and in wedging engagement with the latter, said friction shoe projecting outwardly of said bolster and bearing on the corresponding bolster guide; and spring means forcing said wedge blocks of said pair outwardly against the friction shoe to press the latter against said corresponding bolster guide.

2,408,867
MEANS FOR UTILIZING RADIANT HEAT IN AIRCRAFT
Henry J. De N. McCollum, Chicago, Ill.; Thelma McCollum executrix of said Henry J. De N. McCollum, deceased
Application July 22, 1942, Serial No. 451,876
4 Claims. (Cl. 244—134)

1. Apparatus for preventing the icing of airplane wings which comprises means for radiating heat energy as a beam lengthwise of each wing, and means for deflecting different portions of each beam against the leading edge of its wing.

2,408,868
CARRIER-CURRENT PHASE-ANGLE RELAYING SYSTEM
Arthur C. Mehring and Herbert W. Lensner, East Orange, and Shirley L. Goldsborough, Basking Ridge, N. J., assignors to Westinghouse Electric Corporation, East Pittsburgh, Pa., a corporation of Pennsylvania
Application May 10, 1944, Serial No. 534,846
23 Claims. (Cl. 175—294)

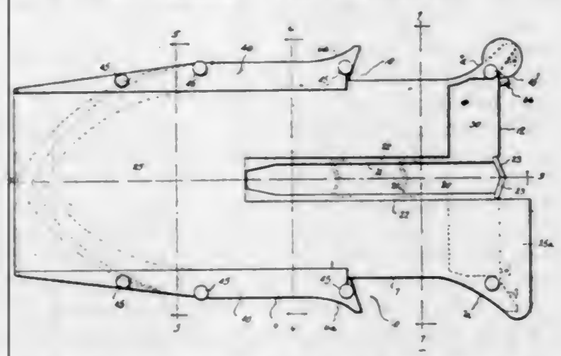
1. Terminal equipment for one terminal of a pilot-channel phase-angle relaying system for an alternating-current transmission-line, comprising line-current-responsive means for deriving a succession of substantially flat-topped operating impulses at times during positive line-current half-cycles, line-current-responsive pilot-channel means for transmitting a succession of restraining impulses to another line-terminal or terminals at times during negative line-current half-cycles of the line-current at the relaying terminal at which said terminal equipment is located, and relay-means for developing a variable operating force only during those portions of the operating impulses during which no restraining impulses are being received from a distant line-terminal.



9. Terminal equipment for a pilot-channel phase-angle relaying system for an alternating-current transmission-line, comprising line-current-responsive means, operative during conditions of fault on the transmission system, for deriving an alternating-current relaying quantity at the relaying terminal, two gas tubes of the sustained-discharge type, each tube having trigger-acting control-circuit means for firing the tube, direct-current plate-cathode-circuit energization-means for said two gas tubes, interconnecting impulsing-means between the plate-cathode circuits of said two gas tubes for responding to the moment of firing of either tube in such manner as to so impulse the effective plate-cathode voltage across the other tube as to extinguish said other tube, means for so applying said relaying quantity to the control-circuit means of the two gas tubes that the tubes fire during half-cycles of opposite polarity of said relaying quantity, means for obtaining a succession of operating-voltage impulses in response to the intermittent operation of one of said two gas tubes, means including pilot-channel means for responding to the intermittent operation of the other gas tube for transmitting a succession of restraining-voltage impulses to another line-terminal or terminals, and relay-means for developing a relay-operating force of variable magnitude dependent upon the proportion of the time during which the half-cycle operating-impulses are not being blocked by restraining-impulses which are received from a distant line-terminal.

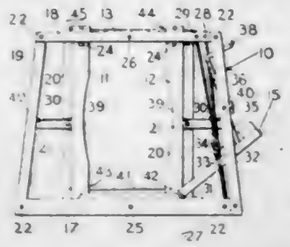
2,408,869
TOWEL RACK
Thomas W. Mullen, Evansville, Ind.
Application August 2, 1945, Serial No. 608,464
1 Claim. (Cl. 211—123)

A towel rack comprising an outwardly bowed bar with a rearwardly extending leg at each end; an inverted heart-shaped, substantially flat bracket fixed respectively to each of said legs, said legs joining said brackets above their lower margins below bracket centers to have the major bracket portions above the legs, and said brackets each having a screw securing hole therethrough spaced between the top edge portion of the bracket and above said legs; whereby the single screw will retain its bracket against rocking outwardly by said top portion under the leverage action by weight of a towel on the outwardly bowed bar, and will retain the bracket against rocking outwardly by said lower margin upon upward dragging of a towel from said bowed bar.



2,408,870
AIRCRAFT LANDING GEAR
Robert P. Murdoch, Mount Lebanon, Pa.
Application April 12, 1943, Serial No. 482,686
1 Claim. (Cl. 244—103)

In combination with a landing gear and landing wheels for aircraft, a positive drive for said wheel comprising a friction wheel in contact with the outer periphery of the landing wheel, an elec-

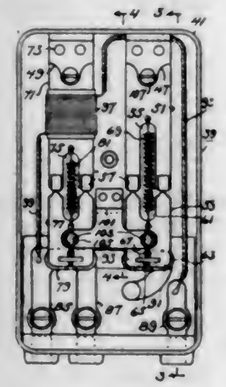


tric motor for driving said friction wheel, and means responsive to movement of the landing gear to its extended position for energizing said motor and for deenergizing the motor circuit by the impact of the landing wheel with the ground.

2,408,871
FLOATING NAVAL BASE AND HARBOR
Fred N. Nelson, Seattle, Wash., assignor to Safety Boat Company, Seattle, Wash., a corporation of Washington
Application April 5, 1943, Serial No. 481,833
14 Claims. (Cl. 114—43.5)

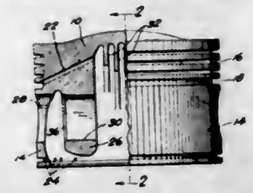
1. A floating, movable marine structure having a main hull and an outer protective hull portion associated directly therewith as a breakwater, and forming a prow for the structure, said main hull being extended above the said protective hull and formed with a portion overhanging the protective hull with clearance and a flight deck supported by the said main hull.

2,408,872
HOG TRAP
Park L. Newbold, Cedar Rapids, Iowa
Application September 18, 1943, Serial No. 502,995
3 Claims. (Cl. 119—98)



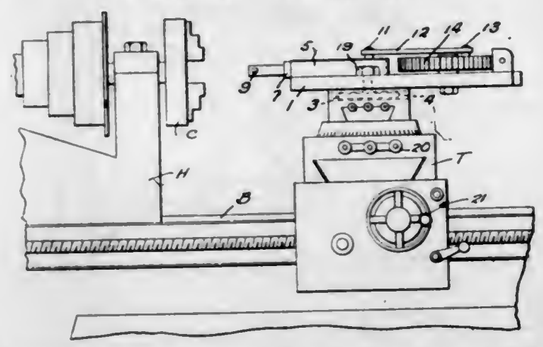
1. In a hog trap, the combination of a pair of lower parallel horizontal frame members, a pair of upper parallel horizontal frame members, a left inwardly converging side member, a right inwardly converging side member, a left perpendicular stationary attaching member with horizontal brace, a right perpendicular stationary attaching member with horizontal brace, these elements secured together by suitable means to form a frame unit, a pair of movable master holding members shaped to the contour of a hog's neck and supported between the upper and lower horizontal frame members, a pedal secured to a lower horizontal frame member, a ratchet arm attached to the pedal, an auxiliary pedal guide member placed parallel to the right diagonal side member, a bolt placed through the auxiliary and side member to engage the ratchet arm, flexible connecting means secured to the pedal, placed over and around twin sets of pulleys adjacent to the upper right frame corner, twin pulleys at the lower right frame corner and single pulleys supported between the upper and lower horizontal frame members at their centers and attached to the movable master holding members so that a downward movement of the pedal causes the master members to move toward the center at equal speed and pressure, a withdrawing spring engaged to the left diagonal frame side member and left master holding member midway between their upper and lower ends, and a withdrawing spring engaged to the right diagonal frame side member and to the right master holding member midway between their upper and lower ends for the purpose of returning the master holding members to open position as controlled by the pedal and ratchet arm.

2,408,873
SNAP ACTING THERMOSTATIC SWITCH
Clark M. Osterheld, Stoughton, Wis., assignor to McGraw Electric Company, Elgin, Ill., a corporation of Delaware
Application March 20, 1944, Serial No. 528,549
9 Claims. (Cl. 200—138)



1. A snap acting thermostatic switch assembly comprising a first bimetal bar, a second bimetal bar having one end pivotally engaging one end of the first bar, the high expansion component of the two bars being on the same side of the assembly and an over-center spring having its ends connected to the intermediate portions of said bars.

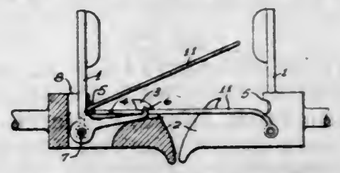
2,408,874
THERMAL RETARDER
Clark M. Osterheld, Stoughton, Wis., assignor to McGraw Electric Company, Elgin, Ill., a corporation of Delaware
Application May 29, 1944, Serial No. 537,941
13 Claims. (Cl. 219—39)



1. A thermal retarder switch unit for controlling a hot water storage tank heater circuit, comprising two bimetal snap-acting switch mechanisms, each comprising a pair of pivotally connected bimetal toggle arms, each pair having a different thermal expansion than the other pair, a heat-conducting casing for said mechanisms adapted to be mounted in heat-receiving relation on a tank, the first switch mechanism being adapted to be in closed position when subject to cold water in the tank and to move into open position when subject to hot water in the tank, the second switch mechanism being adapted to be in open position when subject to cold water and to hot water in the tank and a heating coil for said second mechanism adapted to heat the same and cause closure thereof at a predetermined higher than that of hot water temperature.

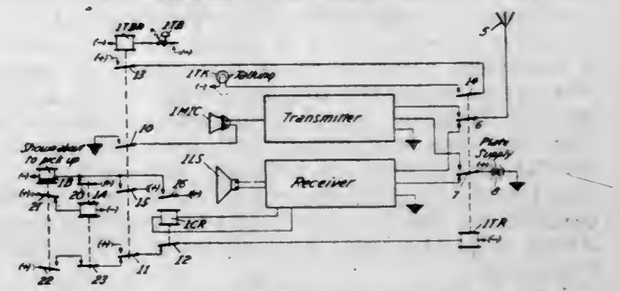
2,408,875
PISTON
Wright A. Parkins, West Hartford, Conn., assignor to United Aircraft Corporation, East Hartford, Conn., a corporation of Delaware
Application December 3, 1942, Serial No. 467,765
2 Claims. (Cl. 309—8)

2. An extruded piston for an internal combustion engine comprising a head, a skirt depending from said head and integral therewith, spaced bosses integral with said head extending in free spaced relation with said skirt and terminating substantially in the plane of the open end of said skirt, a circumferentially continuous inwardly swaged flange around the open end of said skirt projecting inwardly over the interior surface of said skirt, and aligned bores in said bosses for receiving a piston pin.



2,408,876
ATTACHMENT FOR LATHES
Jack Pigott and Norris B. Opheim, Newport News, Va.
Application January 29, 1945, Serial No. 575,022
2 Claims. (Cl. 90—39)

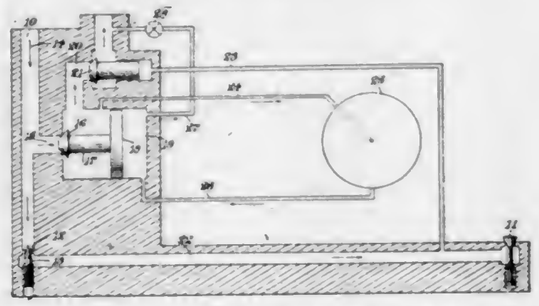
1. Shaper attachment for lathes comprising a base, means for removably securing the base on the tool carriage of the lathe, parallel guides on the base, a slide operable between said guides, said slide formed at one end with means for holding a tool, a worm gear mounted on the base, a link eccentrically connecting the gear with the slide, a worm shaft extending transversely of the base, the ends of said worm shaft adapted to connect to a source of rotary power, and the worm engaging the worm gear.



2,408,877
COUPLING FOR MODEL RAILWAY VEHICLES AND THE LIKE
Thomas Pinder, Scarborough, England
Application April 5, 1943, Serial No. 481,921
In Great Britain April 22, 1942
3 Claims. (Cl. 213—178)

1. An automatic coupling and uncoupling mechanism for railway vehicles comprising a fixed coupling member arranged to detachably receive a coupling link of an adjacent vehicle, said coupling member having a gap platform thereon, a substantially L-shaped lever pivoted on said coupling member, said lever having a normally vertically disposed arm and a horizontal arm normally resting on the platform, said coupling member having means engaging the vertical arm when the latter is moved rearwardly to limit the movement thereof, and said coupling member having stops arranged to be engaged by the coupling hook link of the adjacent vehicle, the hook link of the adjacent vehicle, upon rearward movement of said hook link will rotate said vertically disposed arm about its pivot support

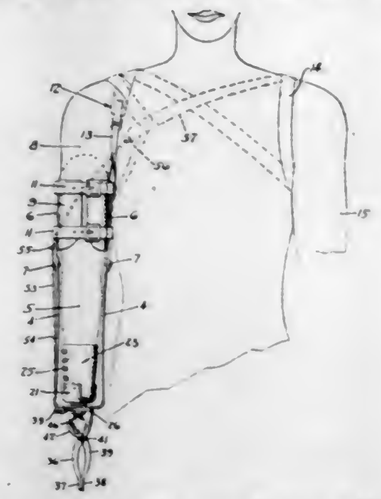
to contact said rearward movement limiting means on said coupling member, said rotation of said arm will cause the front portion of said horizontal arm to be moved upwardly above said gap platform and said fixed coupling member, said horizontal arm thus serving as a guide means for said hook link to elevate said hook link above said coupling member during an uncoupling operation the parts being constructed and arranged so that when two vehicles are coupled together and the hook link is moved suddenly or sharply to impact against the vertical arm it moves the latter rearwardly and the horizontal arm upwardly to allow withdrawal of the hook link from the coupling.



2,408,878
COMMUNICATION SYSTEM
Neil D. Preston, Rochester, N. Y., assignor to General Railway Signal Company, Rochester, N. Y.
Application February 28, 1945, Serial No. 580,224
21 Claims. (Cl. 250—6)

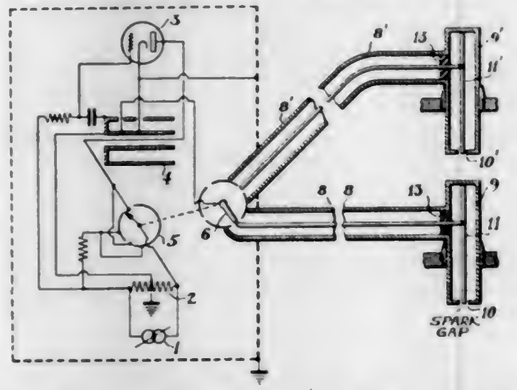
1. In a system for communicating instructions from a primary station to a secondary station by modulation of a carrier frequency, transmitting equipment at one primary station including a transmitter for generating a carrier frequency and modulating means for modulating that carrier frequency in accordance with the intelligence to be communicated to another secondary station, impulsing means at said primary station normally acting to render said transmitter active for a short time at regular spaced intervals to provide spaced pulses of carrier frequency without modulation, manually operable means at said primary station operable by an operator when he desires to communicate instructions to the secondary station for controlling said transmitter to provide a steady carrier frequency and at the same time rendering said modulating means effective to modulate said carrier frequency, receiving means at the secondary station includ-

ing relay means energized in response to said carrier frequency with or without modulation, indicating means at said secondary station, and means effective only if said relay means is intermittently energized and deenergized in response to the transmission of spaced carrier frequency pulses for maintaining said indicating means inactive, whereby said indicating means is rendered active by the transmission of a sustained carrier frequency as soon as the operator at the primary station starts to communicate with the secondary station, and whereby said indicating means is automatically rendered active in the event of failure in the transmission or reception of said carrier frequency.



2,408,879
CARBURATION APPARATUS FOR INTERNAL-COMBUSTION ENGINES AND THE LIKE
Cyril Alphonso Pugh, Ilford, England, assignor to The Plessey Company Limited, Ilford, England, a British company
Application April 21, 1932, Serial No. 483,876
In Great Britain September 8, 1941
7 Claims. (Cl. 123—119)

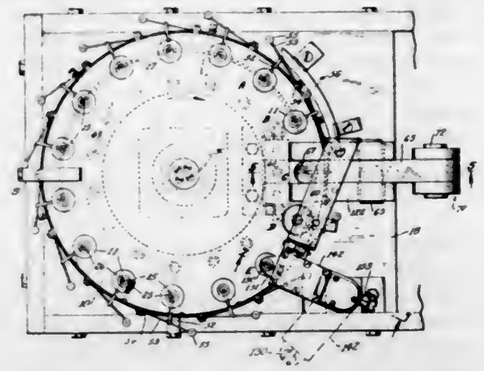
1. A carburation system for supplying liquid fuel to an engine comprising in combination a fuel jet, a fuel conduit through which fuel is supplied under pressure to the jet, a pressure relief valve opening from the fuel conduit, a metering orifice in the fuel conduit situated at a position therein between the jet and the connection of the conduit with the pressure relief valve, a centrifugal pump to which fuel is supplied, means to drive the pump at a speed which maintains a constant relation to engine speed, a regulating chamber for the pressure relief valve, a transversely disposed movable element situated within the chamber and dividing it into two parts, an operative connection between the movable element and the pressure relief valve, and conduits connecting the two parts of the chamber respectively with the inlet and outlet of the centrifugal pump.



2,408,880
ARTIFICIAL HAND
Paul A. Rebers, Minneapolis, Minn.
Application April 28, 1943, Serial No. 484,828
5 Claims. (Cl. 3—12)

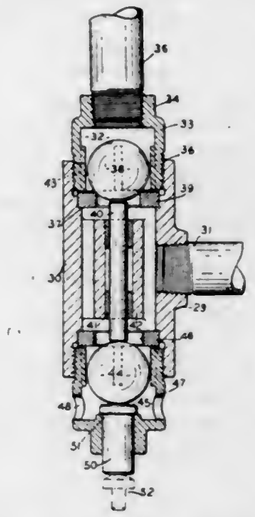
1. In an artificial hand, a supporting member adapted to be secured to an arm above the elbow, a shaft rotatably mounted in the lower end of the support, a sleeve secured to one end of the shaft adapted to receive the stump of the forearm, a notched plate mounted for rotary adjustment about the axis of said shaft, a spring-actuated dog engageable with the notched plate for locking it in adjusted position on the supporting member, a finger member fixed to the plate, a second finger member mounted for pivotal movement on the fixed finger, means for actuating said movable finger upon rotation of said shaft, and a harness supported on the shoulders of the wearer and having an operative connection with said dog whereby the dog may be moved out of locking engagement with the notched plate by movement of the arm and shoulder, thereby to

permit the fingers to be rotatively adjusted with respect to the shaft to facilitate positioning the fingers with respect to the article or work to be performed, by rotation of the forearm relative to the support.



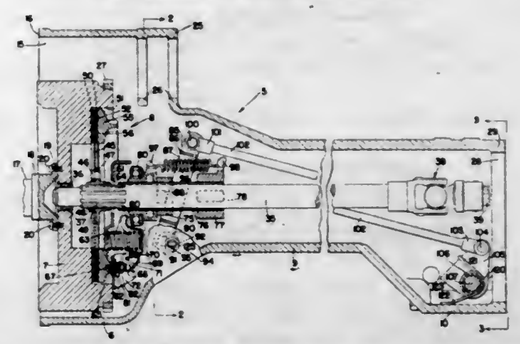
2,408,881
ULTRA HIGH FREQUENCY IGNITION SYSTEM
Francis X. Rettenmeyer, Moorestown, N. J., assignor to Radio Corporation of America, a corporation of Delaware
Application May 29, 1942, Serial No. 445,046
20 Claims. (Cl. 315—39)

1. An ignition system including a source of ultra-high frequency oscillations, means for pulsing said oscillations, at least one spark gap device comprising a resonant line including one of said gaps and upon which standing waves may be established at said ultra high frequency, and means including separate low impedance transmission lines alternately connecting said source to each of said spark gap devices at a point intermediate a voltage node and voltage loop of said standing waves on said resonant line.



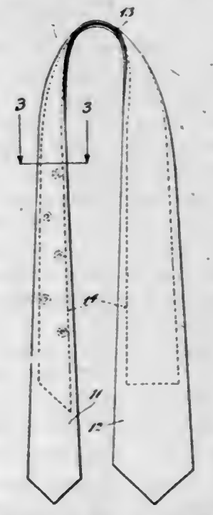
2,408,882
SWAGING MACHINE
Leo Robbins, New York, N. Y., assignor to Roberts Manufacturing Co., New York, N. Y.
Application September 25, 1943, Serial No. 503,790
18 Claims. (Cl. 29—208)

1. In a swaging machine having a movable table and a support mounted in said table, said support being adapted to carry the articles to be swaged, characterized by means for swaging articles by the application of pressure without introducing stresses and strains in the table due



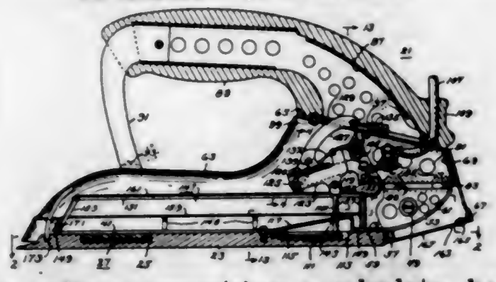
to twisting moment, said last named means including movable members, one member engaging each end of the support, and means for applying equal pressure to said movable members.

2,408,883
SOLENOID CONTROLLED VALVE
Fredrich J. Rode, Toledo, Ohio, assignor to E. W. Bliss Company, Brooklyn, N. Y., a corporation of Delaware
Application October 1, 1942, Serial No. 460,427
2 Claims. (Cl. 277—21)



1. A valve mechanism adaptable for actuation by a solenoid mechanism comprising a valve casing; a pair of interconnected valve members in said casing independently alignable and operated by mechanical pressure in one direction and by their own weight in the opposite direction; means loosely interposed between said valve members for transmitting force from one of said valve members to the other valve member; a plunger reciprocable in said casing independently of said valve members and receiving the weight of at least one of said valve members, said plunger having an end adapted to be engaged by a moving member, such as a solenoid armature, for movement in one direction for actuating the valve members; and means associated with said valve casing for limiting movement of the plunger in the opposite direction for causing disconnection of said plunger and moving member and for positioning one of said valve members in one of its valve controlling positions.

2,408,884
CLUTCH ADJUSTING MECHANISM
Harvey G. Rollin, Moline, Ill., assignor to Deere & Company, Moline, Ill., a corporation of Illinois
Application March 4, 1944, Serial No. 525,084
8 Claims. (Cl. 192—111)



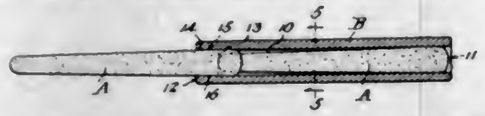
1. In a power transmission device including a housing and a releasable clutch, a transmission shaft connected thereto, and a throwout member for said clutch disposed within said housing, and an actuating rockshaft journaled in said housing spaced from said throwout member, the combination of a throwout lever disposed in said housing for actuating said member, a connecting rod extending within said housing between said rockshaft and said lever, a fulcrum support on which said lever is pivoted, means for pivotally mounting said fulcrum support within said housing including a shaft fixed to said support eccentrically relative to the pivot axis of said lever, said shaft being journaled in an aperture in a wall of said housing and extending outwardly through said housing wall, and means for fixing said shaft to said housing wall in angularly adjusted position.

2,408,885
NECKTIE
William S. Romme, Stamford, Conn.
Application December 9, 1943, Serial No. 513,542
5 Claims. (Cl. 2—155)

4. A necktie comprising a neckband portion, a standing portion, a knot forming portion and a lining; a longitudinal series of obstructions removably attached to said lining, said obstructions being attached on the part of said lining which is carried within the adjoining parts of the neckband portion and the standing portion of the necktie and becoming trapped in the knot when tied to prevent slipping of the standing part back through the knot when the knot is tightened.

2,408,886
ELECTRIC IRON
Frank W. Scharf, San Gabriel, Calif., assignor to McGraw Electric Company, Elgin, Ill., a corporation of Delaware
Application November 1, 1941, Serial No. 417,437
13 Claims. (Cl. 219—25)

1. A sadiron comprising a soleplate, heating means for the soleplate, a housing for the iron forming with the soleplate an air chamber, and rigid supporting means supporting the housing in spaced relation to the soleplate and being confined to the local area of the rear end of the iron, said supporting means comprising a pair of spaced supports secured to the rear edge portion of the soleplate and a skeleton frame upstanding from said supports and being secured to the local rear end portion of the housing.

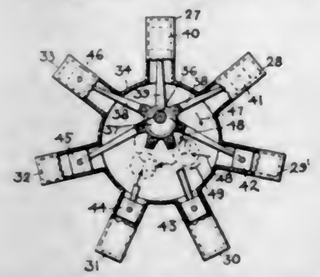


2,408,887
SCREW DRIVER
Carl A. Schriner, Defiance, Ohio, assignor of one-half to Lester A. Snyder, Defiance, Ohio
Application June 18, 1943, Serial No. 491,281
5 Claims. (Cl. 145—50)

1. In a screw driver adapted to grippingly engage a screw, in combination, a hollow tubular member closed at one end and having a slot in said closed end, curved resilient strips fitted within said tubular member, said resilient strips being bowed away from each other and having portions of reverse curvature protruding through the slot in said tubular member to engage the kerf in a screw, means preventing longitudinal motion of said strips in said tubular member, and a slotted member slidably mounted in said tubular member and adapted to force said strips together within said tubular member thereby separating the ends of the reverse curvature portions of said strips exterior of said tubular member to grippingly engage the kerf of a screw.

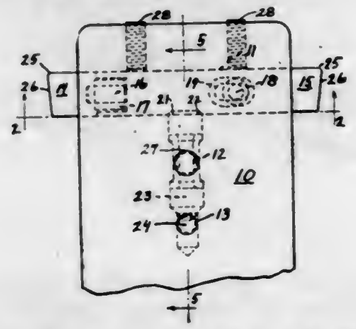
2,408,888
MANICURE DEVICE
Charles T. Shoop, College Point, N. Y.
Application June 24, 1944, Serial No. 541,901
2 Claims. (Cl. 132—76.2)

1. In a manicure device, a plurality of emery boards and a holder and handle member therefor including an elongated body formed with a longitudinal chamber of a length approximating the length of the emery boards and opening through the rear end face thereof and terminating in spaced relation to the opposite forward end face of the same, said chamber being of a height to accommodate said emery boards arranged in superimposed relation and of a width slightly less than the major width of said emery boards so as to frictionally retain said boards therein, said body having a slot opening through said forward end face and extending therefrom to and communicating with the chamber adjacent the upper portion thereof, said slot being



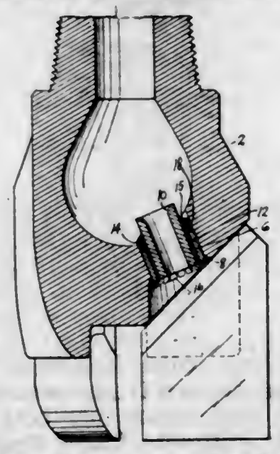
of a height equal to the thickness of a single emery board and having outwardly converging opposite side walls spaced apart a distance slightly less than the spacing of the side edges of the major width of the rear end of the emery board, and said body having an elongated notch of lesser width than and communicating with the chamber and opening through the rear end face of the body.

2,408,889
PRODUCTION OF ORGANIC COMPOUNDS
Nancy Short, Runcorn, England, assignor to Imperial Chemical Industries Limited, a corporation of Great Britain
No Drawing. Application December 14, 1944, Serial No. 568,215. In Great Britain January 12, 1944
6 Claims. (Cl. 260—486)



1. A process for the production of an acrylyl compound which comprises adding vinylidene chloride to a mixture of sulfuric acid and a member of the group consisting of formaldehyde and polymers thereof, said mixture containing an amount of water such that the concentration of the sulfuric acid is not greater than 85%, and the ratio of 98% sulfuric acid to formaldehyde, by weight, contained in the mixture is at least 442 to 120, the reaction mixture being maintained at a temperature between 30° C. and 60° C. during the addition of vinylidene chloride.

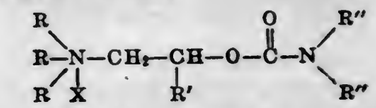
2,408,890
INTERNAL-COMBUSTION ENGINE
Theodor P. Soprounoff, New York, N. Y.
Application July 8, 1943, Serial No. 493,814
7 Claims. (Cl. 123—55)



3. A multicylinder internal combustion engine having a crankcase with a crankshaft, cylinders radially extending from the crankcase, and pistons in the cylinders with connecting rods; in combination, an eccentric rotatively supported on the crankpin of the crankshaft; a collar rotatively mounted on the eccentric rigidly connected to the inner end of one of the connecting rods; and means for connecting the inner ends of the other connecting rods with the collar, the firing order of the cylinders being so arranged as to produce a component force of an explosion in one cylinder and compression in another cylinder acting on successive peripheral portions of the collar for causing the eccentric to rotate, thereby varying the compression space in the cylinders the variations in the strokes being effected solely by the component force.

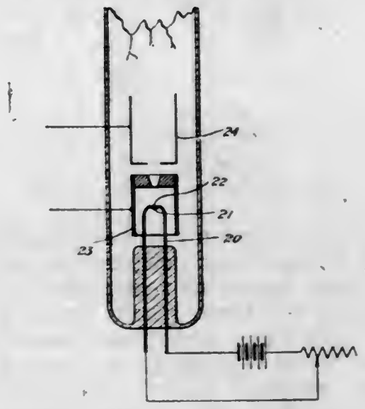
2,408,891
CUTTER
Herman L. Steiner, Muskegon, Mich., assignor to Madison Manufacturing Company, Muskegon, Mich.
Application March 9, 1944, Serial No. 525,653
2 Claims. (Cl. 77—58)

1. A boring tool comprising a boring bar having a transverse cutter receiving slot and provided with an axially disposed well communicating at one end with the slot, a pair of cutter blades arranged side by side in said slot and interrelatively and parallelly slidable on each other throughout the major portions of their length and provided at their outer ends with cutting edges, said blades being provided intermediate of their ends with centrally arranged registering transverse grooves each having converging side walls, adjusting means disposed between the blades for determining the diameter of the bore to be cut, means carried by the blades for fixing said predetermined bore, a pin disposed in the well of the boring bar and arranged to engage simultaneously the converging walls of the transverse grooves for centering the blades with respect to the boring bar, and means for engaging and forcing the pin outwardly to effect the centering of the blades and the clamping of the same within the transverse slot of the bar.



2,408,892
SLUSH TUBE
John C. Stokes, Houston, Tex., assignor to Reed Roller Bit Company, Houston, Tex., a corporation of Texas
Application July 18, 1944, Serial No. 545,489
8 Claims. (Cl. 255—61)

1. In combination, a bit having an aperture therein, a bushing in said aperture, a slush tube secured within a sleeve, and said tube and sleeve positioned and secured within the said aperture and bushing, the said sleeve having at one end thereof a belled periphery and at the other end thereof an axially cut periphery.

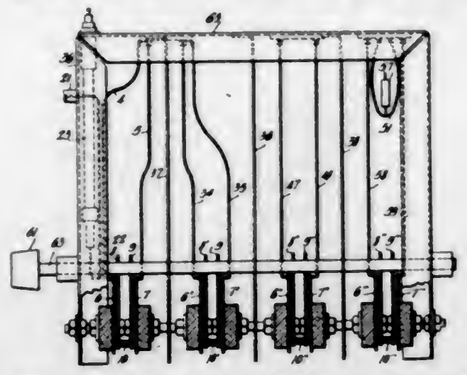


2,408,893
CHOLINE-LIKE COMPOUNDS
Kenneth C. Swan and Norman G. White, Iowa City, Iowa
No Drawing. Application August 7, 1943, Serial No. 497,858
4 Claims. (Cl. 260—482)

1. An essentially non-toxic surface-active compound of the formula

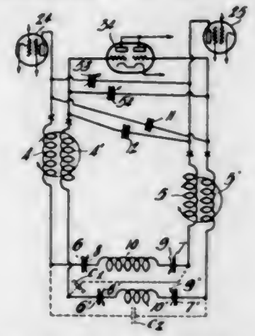
wherein R is selected from the group consisting of methyl and ethyl radicals; X is an anion; R' is selected from the group consisting of hydrogen and methyl radicals; and R'' is selected from the group consisting of alkyl radicals containing at least four carbon atoms, and the phenyl radical.

2,408,894
ELECTRODE
Constantin S. Szegho, New York, N. Y., assignor to The Rauland Corporation, Chicago, Ill., a corporation of Illinois
Application May 13, 1942, Serial No. 442,837
3 Claims. (Cl. 250—27.5)



1. The method of minimizing anomalous field emission from an electrode of low melting point metal which comprises the following steps: enclosing said electrode in an evacuated envelope, and evaporating in said vessel a high melting point metal at a temperature exceeding approximately 1900° K.

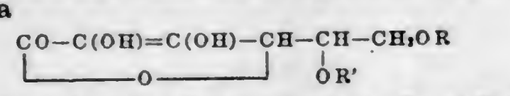
2,408,895
ULTRA HIGH FREQUENCY TUNER
Alfred H. Turner, Collingswood, N. J., assignor to Radio Corporation of America, a corporation of Delaware
Application March 31, 1943, Serial No. 481,215
12 Claims. (Cl. 250—40)



1. An ultra high frequency tuning circuit including a pair of inductive elements, at least one adjustable capacitive element, a third inductive element having an inductance at least of the order of the inductance of one of said pair of elements and movable with said capacitive element, a utilization device, means connecting one terminal of each of said pair of inductive ele-

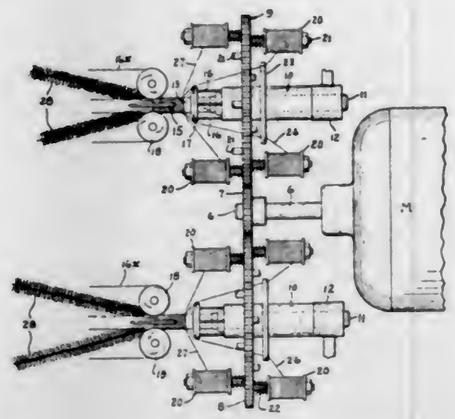
ments to said utilization device, means connecting the remaining terminals of said pair of elements in series relation with said capacitive ele-

ment and said third inductive element, and means for adjusting said capacitive element to vary simultaneously the effective series inductive and capacitive reactance of said circuit.



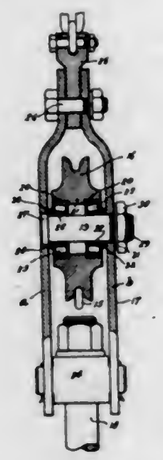
2,408,896
MICROWAVE MULTIBAND TUNER
Alfred H. Turner, Collingswood, N. J., assignor to Radio Corporation of America, a corporation of Delaware
Application November 29, 1943, Serial No. 512,107
6 Claims. (Cl. 250—40)

1. Ultra-high-frequency apparatus including a plurality of inductively coupled tuning circuits each comprising a pair of resonant lines and adjustable means for tuning said lines, a plurality of coupling capacitors, and means connecting said capacitors between the resonant lines of different ones of said coupled circuits at predetermined points on said lines to provide predetermined coupling between said circuits throughout the tuning range of said circuits.



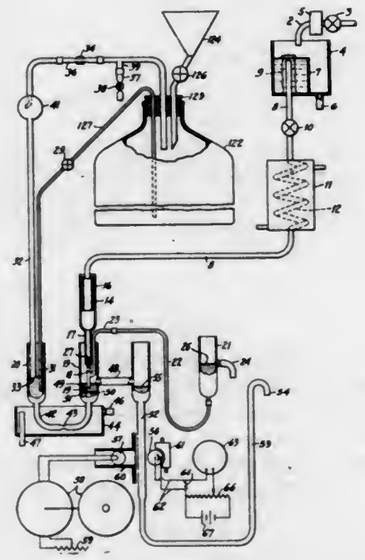
2,408,897
DERIVATIVES OF ISOASCORBIC ACID
Percy A. Wells, Abington, and Daniel Swern, Melrose Park, Pa., assignors to the United States of America, as represented by the Secretary of Agriculture
No Drawing. Application May 11, 1942, Serial No. 442,557
7 Claims. (Cl. 260—344.5)
(Granted under the act of March 3, 1883, as amended April 30, 1928; 370 O. G. 757)

2. Isoascorbic compounds represented by the formula



wherein one of the substituents R and R' represents an acyl radical of a saturated aliphatic monocarboxylic acid and the other represents a hydrogen atom.

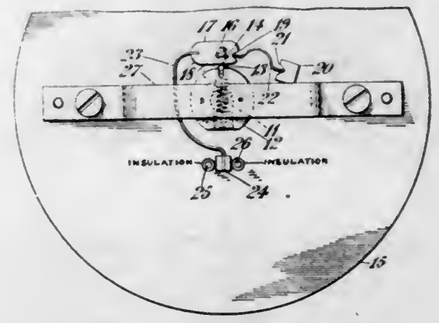
2,408,898
CHENILLE MAKING MACHINE
Joseph Wilmsen, Rushland, Pa.
Application November 19, 1945, Serial No. 629,491
1 Claim. (Cl. 57—24)



The combination with a tinsel making machine of a spool head for supplying strands of tinsel to the forming bar of said machine, said head comprising a relatively small body of a size to fit the dimensions of a conventional machine of this type, a first plurality of spools on one face of said head, a second plurality of spools disposed on the opposite face of said head in staggered relation to the first mentioned spools, and a plate rotatable with said head and having apertures therein for passage of strands from said second plurality of spools therethrough, there being apertures in said head registering with the apertures in said plate for passage of strands from said second plurality of spools in the direction of the strands from the first plurality of spools.

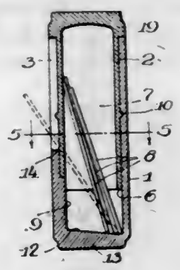
2,408,899
TAKE-UP FOR ROLLER BEARINGS
Hal F. Wright, Lisbon, Ohio, assignor to Chester Manufacturing Company, Lisbon, Ohio, a firm composed of Hal F. Wright and Mary T. Wright
Application March 5, 1945, Serial No. 581,124
4 Claims. (Cl. 308—208)

1. A take-up for roller bearings including a frame comprising spaced frame members, a shaft located through said frame members and having a head upon one end, one frame member having an opening in which said head is located, the other end of the shaft being threaded and extending through an opening in the other frame member, a nut upon said threaded end of the shaft abutting the outer side of the adjacent frame member, spaced roller bearing cones mounted upon the shaft, one cone abutting the last named frame member and the other cone abutting the head upon the shaft, a rotatable member surrounding the shaft, spaced cups within the rotatable member, and rollers between the cups and cones.



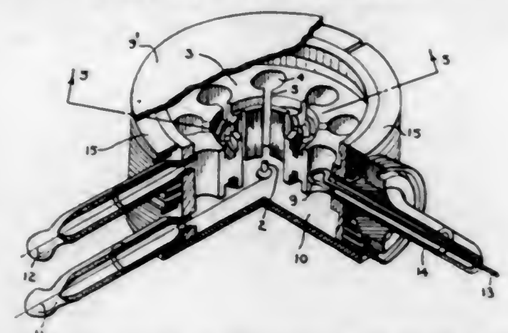
2,408,900
METHOD AND APPARATUS FOR DETECTING SUGAR
Paul W. Alston, Berkeley, and Erwin E. Morse, Woodland, Calif.
Application March 24, 1942, Serial No. 435,940
6 Claims. (Cl. 23—230)

3. The method of continuously determining sugar in solution, which comprises the steps of providing a confined body of a liquid reagent, which is but slightly miscible with said solution, said reagent being responsive in the presence of sugar to color said solution, maintaining on the body of the reagent a layer of the solution to be tested, continuously injecting a stream of the solution through the body of the superposed solution and partially into the body of reagent to effect mixing at the interface only of the two bodies, then withdrawing a continuous flow of the resulting mixture, and finally measuring the color of said mixture in terms of the sugar content.



2,408,901
ELECTRIC SWITCH SENSITIVE TO SMALL OPERATING MOVEMENTS
Alfred Arnot, Warrington, England, assignor to Aeronautical & Mechanical Investments Limited, a British company
Application April 30, 1943, Serial No. 485,220
In Great Britain April 23, 1942
2 Claims. (Cl. 200—153)

1. An electric switch mechanism comprising a base, a pivoted contact-carrier mounted on the base and having a pallet-face in a plane to one side of the pivotal axis and facing away therefrom, a switch contact-member carried by the contact-carrier so as to be operated when the contact-carrier rotates about its axis, an actuating member having a portion movable towards the pivot of the contact-carrier and means to press said pallet-engaging portion against the pallet-face of said contact-carrier, said actuating member being mounted so that its line of pressure passes through the axes of said pivot and is capable of movement to either side to move



the contact-carried correspondingly, a pair of contacts adapted to be alternatively engaged by said contact-member depending on its direction of movement so that the contact member may act as a two-way switch member with a central neutral position, and a spring mounted on the base and engaging the contact-carrier in such a position as to act as a toggle-spring and thus to increase the certainty of movement of the contact-member.

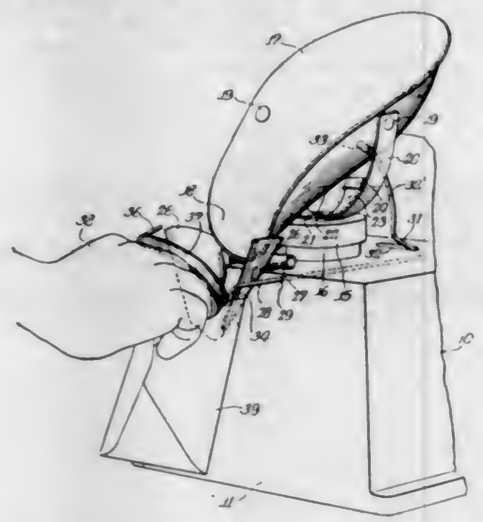
2,408,902
CONTAINER FOR PENCIL LEADS AND THE LIKE
Garfield L. Beckstrom, Chicago, Ill., assignor to Autopoint Company, Chicago, Ill., a corporation of Illinois
Application May 15, 1944, Serial No. 535,630
2 Claims. (Cl. 206—56)

1. A container for leads for mechanical pencils and the like, comprising a pair of hollow telescoping members each closed at one end and each having a longitudinally extending slot extending to the open end thereof, said members being movable with relation to each other to bring the slots into and out of registry to open and close the same, one of said members having a shoulder positioned at the inner closed end of its slot and an inclined bottom slanting away from the slot, said shoulder being spaced from the bottom a distance not less than the width of the container, the slanting bottom tending to cause the leads to assume a tilted position toward the slot when the container is held upright.

2,408,903
ULTRA HIGH FREQUENCY GENERATOR
Orrick H. Biggs, Beverly, and Harold Heins, Marblehead, Mass., assignors to Sylvania Electric Products Inc., Salem, Mass., a corporation of Massachusetts
Application June 12, 1943, Serial No. 490,698
4 Claims. (Cl. 250—27.5)

1. An ultra-high frequency generator comprising: a radially-slotted annular conducting member having a concentric groove near its inner edge; a cylindrical cathode mounted inside said annular member, concentric therewith and spaced therefrom; and a deformable ring in said groove contacting alternate conducting pieces between the slots.

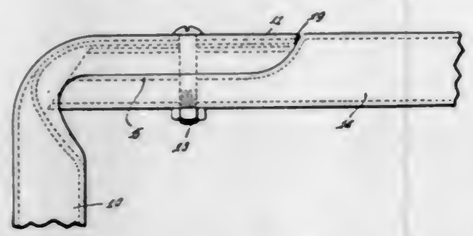
2,408,904
COLOR STABILIZATION
Howard C. Black, Chicago, Ill., assignor to Industrial Patents Corporation, Chicago, Ill., a corporation of Delaware
No Drawing. Application December 11, 1941, Serial No. 422,545
7 Claims. (Cl. 99—163)



1. The process of treating oleaginous material containing gum guaiac and normally tending to become discolored in the presence of metals, which comprises incorporating in said oleaginous material an acid reacting material stronger than acetic acid in sufficient amount whereby such discoloration is substantially retarded.

2,408,905
PREPARATION OF SYNTHETIC GLYCERIDES
Howard C. Black and Charles A. Overley, Chicago, Ill., assignors to Industrial Patents Corporation, Chicago, Ill., a corporation of Delaware
No Drawing. Application November 29, 1941, Serial No. 420,942
9 Claims. (Cl. 260—410.6)

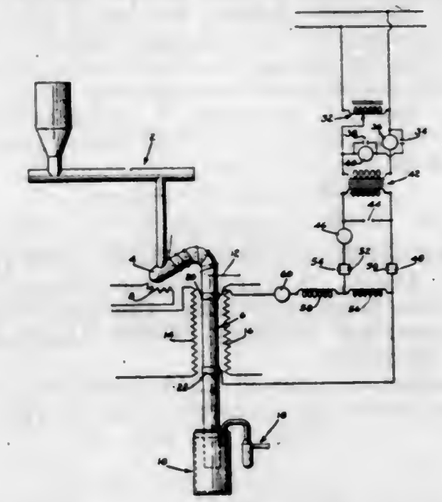
1. The method of preparing esters of polyhydroxy compounds and unsaturated higher fatty acids which comprises saturating the unsaturated bonds of an unsaturated higher fatty acid by halogenation to form a saturated higher fatty acid, converting the acid so saturated into an acid chloride, reacting the acyl derivative with at least one hydroxyl group of a polyhydroxy compound to form an ester and thereafter dehalogenating the acid radical portion of the ester to reestablish the unsaturated bonds.



2,408,906
SCOOP DISPENSING DEVICE FOR SCALES
Alfeo Bocchicchio, Chicago, Ill., assignor to Joseph M. Zaccaria, Chicago, Ill.
Application May 12, 1944, Serial No. 535,311
5 Claims. (Cl. 265—27)

1. The combination with a scale having a fulcrumed beam, of a scoop pivotally supported on said beam, a chute positioned on said scale adjacent the discharge end of said scoop, a rock shaft journaled on said scale, a crank formed on one end of said rod and engageable with one end of said scoop, a crank formed on the other end

of said rod and positioned across said chute whereby said scoop is actuated to discharge the contents therein simultaneously with the positioning of a container in a position to receive material from said chute.

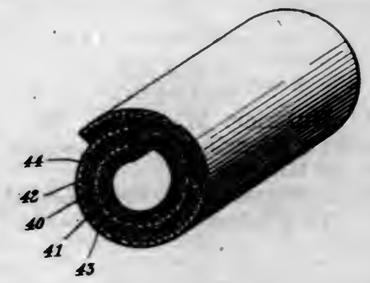


2,408,907
METAL FURNITURE
Earl C. Booth, Columbus, Ind., assignor to Nobilitt-Sparks Industries, Inc., Columbus, Ind., a corporation of Indiana
Application August 31, 1944, Serial No. 552,141
9 Claims. (Cl. 287—54)

6. In combination, a cylindrical metal tubular member collapsed over a part of its length to create a portion of double thickness, a second cylindrical member, a bolt extending through the double-thickness portion and said second member for securing them together, said double-thickness portion and second member being provided with interengaging surfaces at least portions of which are disposed in planes extending longitudinally of the second member and lying on opposite sides of and substantially parallel to said bolt.

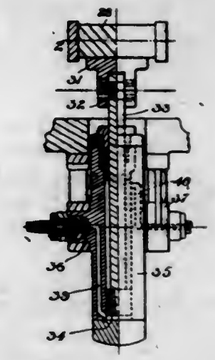
2,408,908
METHOD OF PRODUCING ANTIRACHITIC MATERIAL
Lester F. Borchardt, Minneapolis, Minn., assignor, by mesne assignments, to General Mills, Inc., a corporation of Delaware
Application May 2, 1934, Serial No. 723,539
13 Claims. (Cl. 204—166)

1. The process of treating an activatable substance to develop therein the anti-rachitic (vitamin D) property, which comprises heating and vaporizing said substance, and subjecting the same to solely a high frequency electrical discharge between spaced electrodes, while in the vapor state.



2,408,909
ANNULAR FLUID SEAL
Olin Brummer, Oak Park, Ill.
Application June 24, 1944, Serial No. 541,870
3 Claims. (Cl. 286—11)

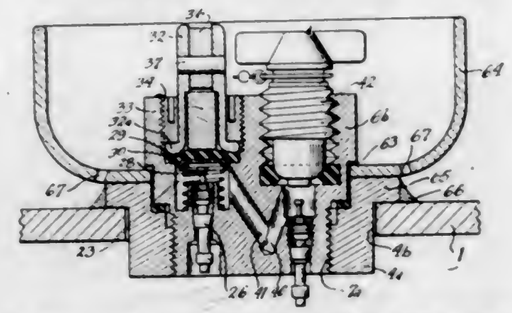
1. An annular fluid seal comprising a body of rubber-like material having a central tubular part, annular diaphragm-like flange portions extending radially outwardly from each end respectively of said tubular part, said flange portions flexing axially toward and away from each other pivoting on said tubular part in compression and expansion of the seal, a cylindrical axial extension of each said flange portion extending axially outwardly of the flange portions at each end, said axial extensions moving axially toward and away from each other with movement of said flange portions, said flange portions and axial extensions forming a counterbore at each end of the seal, the corner between each flange portion and its respective axial extension being sufficiently sharp whereby the flange portions maintain substantially flange form throughout said flexing movements, and further diametrically enlarged annular face parts extending radially outwardly from the axial extensions respectively, said flange portions extending outwardly a sufficient distance and said axial extensions being of sufficient internal diameter whereby the tubular part telescopes at each end into said counterbores during compression of the seal.



2,408,910
ELECTRICAL CONDENSER
John Burnham, North Adams, Mass., assignor to Sprague Electric Company, North Adams, Mass., a corporation of Massachusetts
Application July 27, 1942, Serial No. 452,501
4 Claims. (Cl. 175—41)

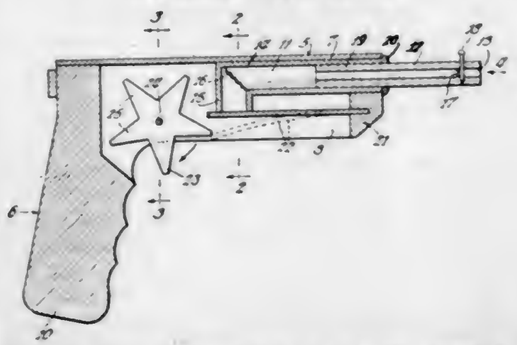
1. An electrical condenser comprising a helically wound aluminum foil having a purity greater than about 99.85%, dense, thin, non-porous films of the bi-refringent crystalline modification of aluminum oxide electrolytically formed on opposite sides of the foil, a second electrode consisting of a moisture-impervious integral metallic coating on the inner dielectric film and a moisture-impervious insulating coating on the outer dielectric film.

2. In the manufacture of electrical condensers, the process comprising the steps, immersing an aluminum electrode having a purity greater than about 99.85% in an electrolyte selected from the class consisting of aqueous solutions of boric acid, tartaric acid and citric acid, electrolytically forming thereon at a temperature between 90° C. and 100° C. a dense, thin, non-porous film of the bi-refringent crystalline modification of aluminum oxide to a thickness corresponding to a filming voltage at least 100 volts greater than the maximum operating voltage of the condenser, drying the film so formed, and thereafter evaporating under vacuum a thin, moisture-impervious coating of one of the metals of the group consisting of lead, zinc, bismuth, tin and aluminum on the surafce of the aluminum oxide film.



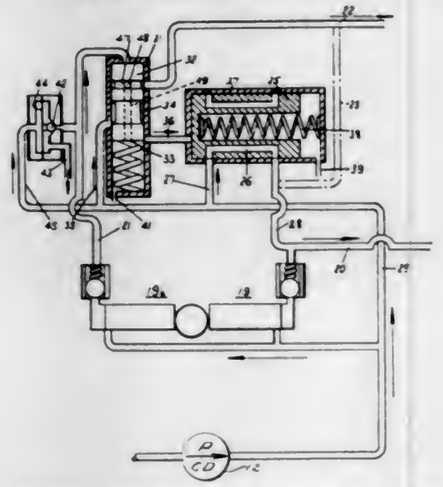
2,408,911
PLASTIC MOLDING MACHINE
Arthur A. Burry, Toronto, Ontario, Canada, assignor to Cyril Fuller
Application November 11, 1943, Serial No. 509,936
5 Claims. (Cl. 18—16)

4. A plastic molding machine comprising a base, an abutment mounted at one end of said base, a flange rigid with said base spaced from said abutment, horizontal tie rods extending from said abutment to said flange, a die block holder mounted on said tie rods adjacent to said flange, a die block holder slidably mounted on said tie rods between the aforesaid holder and said abutment, a horizontally movable hydraulically operated member mounted in said abutment, toggle links connecting said hydraulically operated member with said slidable die block holder, a rigid member extending from the toggle member connected to said hydraulically operated member



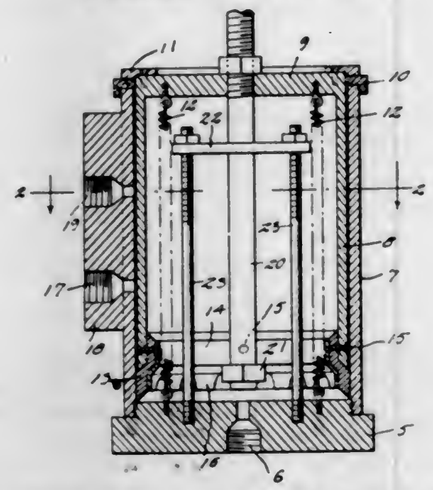
and adapted to engage in locking contact with said slidable die block holder to form a rigid strut therebetween, and means for operating said rigid locking member to first clear the rigid member from locking contact with the die block holder, then moving said die block holder longitudinally on said tie rod, and then returning the die block holder and locking same prior to the application of compression pressure by said hydraulically operated member.

2,408,912
FITTING
William C. Buttner, Winnetka, Ill., assignor to The Bastian Blessing Co., Chicago, Ill., a corporation of Illinois
Application September 19, 1941, Serial No. 411,484
10 Claims. (Cl. 222—3)



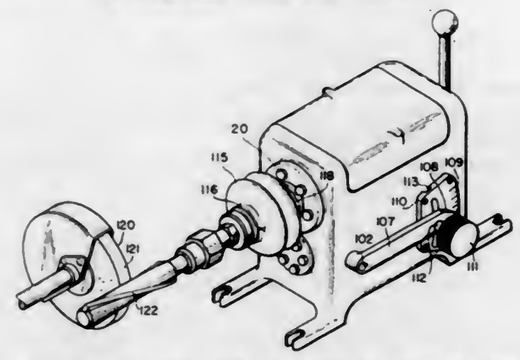
1. A fitting for use in a liquefied petroleum gas dispensing system comprising a body, a socket therein adapted for removable connection with any suitable gas conduit, a chamber in the body, a connection between the chamber and the socket, a check valve in the chamber adapted normally to prevent flow of gas through the valve into the chamber while permitting flow of gas in the opposite direction, a flexible diaphragm and means including a member removably interlocking with the valve body for holding the diaphragm in position to make a gas-tight closure for the chamber, guide means projecting from the interlocking member, a floating element in the guide means, a manually operated lever pivoted on the guide means, an eccentric associated with the lever adapted to engage the floating element and, in one position of the lever, to flex the diaphragm to cause it to open the valve to permit flow of gas into the chamber.

2,408,913
TOY GUN
Arthur C. Cimaglia, Chicago, Ill.
Application May 18, 1943, Serial No. 487,469
3 Claims. (Cl. 46—9)



1. A toy gun comprising a hollow body, a tubular powder chamber open at both ends secured therein, said chamber being adapted to contain a quantity of non-explosive, non-combustible powder, a barrel removably secured in one end of the chamber and having a restricted discharge opening, porous retaining walls extending across the hollows of the chamber and barrel for preventing accidental escape of the powder, and a resilient element adapted to strike against the open inner end of the chamber whereby to produce sound simulating the sound of an explosion and simultaneously to compress air in the chamber and thereby discharge a small quantity of the powder from the barrel whereby to simulate a puff of smoke.

2,408,914
PRESSURE LUBRICATION SYSTEM
Thomas Clark, Edward Victor Windsor, and Laurence Hart, Coventry, England, assignors to Armstrong Siddeley Motors Limited, Coventry, England
Application October 25, 1943, Serial No. 507,560
In Great Britain September 17, 1943
6 Claims. (Cl. 184—6)

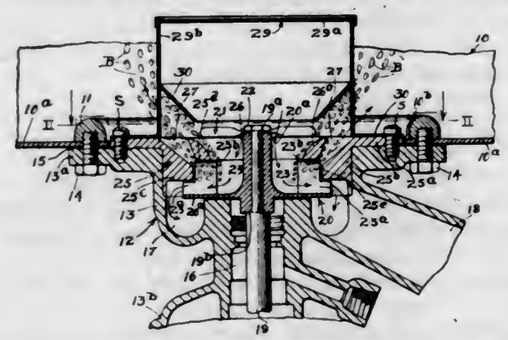


1. A lubrication system including a main constant-pressure pump, a metering pump interposed between the main pump and a point to be lubricated, means by which the metering pump is by-passed when starting up, and means for automatically closing the by-pass after a predetermined time-lag.

2,408,915
PISTON
Ben Cones, Indianapolis, Ind.
Original application June 24, 1943, Serial No. 492,099. Divided and this application February 2, 1945, Serial No. 575,838
1 Claim. (Cl. 309—4)

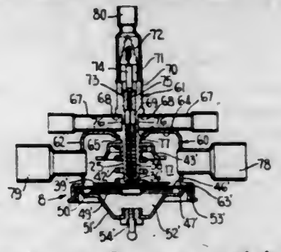
In a piston construction including a skirt portion adapted for working in a cylinder, a sealing ring secured to the inner lower edge of the skirt of the piston and projecting below the lower edge of the piston, a clamping ring positioned within the sealing ring, and spring fingers on the lower edge of the clamping ring and responsive to internal pressure in the piston to expand the lower edge of the sealing ring against the wall of the cylinder.

2,408,916
BIT SHARPENER
André Crot, North Hollywood, Calif., assignor to Lockheed Aircraft Corporation, Burbank, Calif.
Application October 6, 1944, Serial No. 557,412
4 Claims. (Cl. 51—232)



2. Apparatus for machining a helical surface comprising chucking means for a workpiece to be machined, a coaxial shaft rotatably and axially reciprocatably supporting said chucking means, a lead screw positioned parallel to and adjacent said shaft, drive means coupling said lead screw and said shaft together for simultaneous rotation at a fixed ratio, a nut on said screw axially movable in response to rotation of said lead screw, a thrust bearing associated with and adapted to move said chucking means axially, a walking beam pivotally coupled at one point thereon to said nut and at another point thereon to said thrust bearing, means to support pivotally said walking beam for angular displacement in response to axial motion of said nut whereby said thrust bearing and said nut are thus coupled together through said walking beam for simultaneous axial displacement.

2,408,917

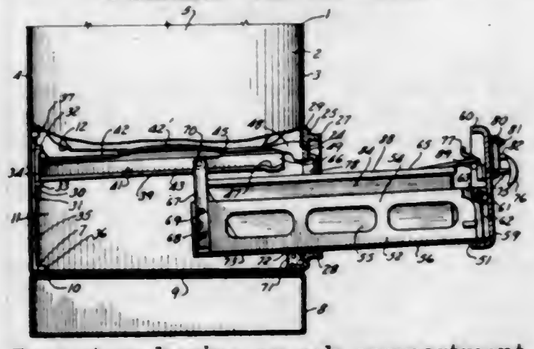


WITHDRAWN

2,408,918
SLOTTED THROAT BOOSTER PUMP
Russell R. Curtis, Dayton, Ohio, assignor to Curtis Pump Company, Dayton, Ohio, a corporation of Ohio
Application March 25, 1944, Serial No. 528,021
11 Claims. (Cl. 103—113)

1. In combination with a container for a pond of liquid to be pumped, a vapor separator and pump suspended on the bottom wall of said container having an inlet mouth receiving the liquid material by gravity flow from the container, a low velocity pumping chamber in said pump receiving the liquid material from said inlet, a high velocity pumping chamber receiving the liquid from said low velocity pumping chamber, bubble-liberating means in said low velocity chamber, and said pump having a vent joining said low velocity pumping chamber with the interior of the container, said vent communicating with said high velocity pumping chamber solely through said low velocity pumping chamber.

2,408,919
REFRIGERATION EXPANSION VALVE
Earnest J. Dillman and Franklyn Y. Carter, Detroit, Mich., assignors to Detroit Lubricator Company, Detroit, Mich., a corporation of Michigan
Application April 5, 1945, Serial No. 586,668
14 Claims. (Cl. 62—8)



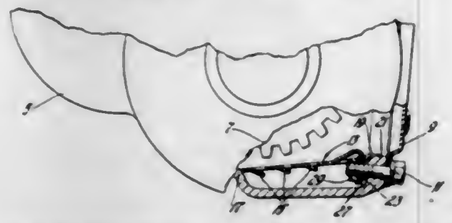
1. An expansion valve comprising a cup-like casing having an end wall and an opposite open side, a pressure responsive diaphragm closing and sealing said open side, a cap member sealed to said casing and to said diaphragm and forming with said diaphragm a temperature responsive pressure chamber, a volatile liquid in said chamber, said casing having inlet and outlet openings for flow of vaporized refrigerant medium through said casing in contact with said diaphragm, a tubular member projecting externally from said end wall concentric with said diaphragm and having a longitudinal passageway therethrough opening into said casing, a valve seat member in said passageway, a valve member in said passageway on the inlet side of said seat member, valve operating means extending through said passageway and said seat member and connecting said valve member to said diaphragm, said tubular member having an outlet from said passageway external of said casing, and means sealing said passageway around said valve operating means on the casing side of said outlet.

2,408,920
PROCESS FOR SEPARATING MERCAPTANS
Harry E. Drennan, Bartlesville, Okla., assignor to Phillips Petroleum Company, a corporation of Delaware
No Drawing. Application September 1, 1944, Serial No. 552,376
8 Claims. (Cl. 260—609)

1. In the preparation of tertiary alkyl mercaptans having twelve carbon atoms per molecule by the catalytic addition of hydrogen sulfide to tertiary olefin polymers having twelve carbon atoms per molecule wherein a crude reaction product is formed comprising essentially tertiary mercaptans having twelve carbon atoms per molecule, mercaptans having eight carbon atoms per molecule, mercaptans having four carbon atoms per molecule, and unreacted olefin polymers, said mercaptans having twelve carbon atoms per molecule being present in said crude reaction product to the extent that said product contains more

than about 3.5 weight per cent sulfur with respect to the sulfur of said mercaptans having twelve carbon atoms per molecule, the method of separating said mercaptans having eight and less carbon atoms per molecule from said mercaptans having twelve carbon atoms per molecule which comprises adding to said crude reaction product sufficient liquid hydrocarbon diluent to reduce the sulfur content thereof with respect to the sulfur of said mercaptans having twelve carbon atoms per molecule to not more than about 3.5 weight per cent of the diluted reaction product, intimately contacting the thus-diluted reaction product with a strong aqueous solution of an alkali metal hydroxide at substantially atmospheric temperatures to precipitate said mercaptans having eight and less carbon atoms per molecule as insoluble alkali metal mercaptides, said mercaptans having twelve carbon atoms per molecule remaining unprecipitated.

2,408,921
STOVE FOR BURNING SOLID FUELS AND AN ASH CONTAINER THEREFOR
Edwin Esson, Kansas City, Mo., assignor to Locke Stove Company, Kansas City, Mo., a corporation of Missouri
Application September 22, 1943, Serial No. 503,348
4 Claims. (Cl. 126—245)

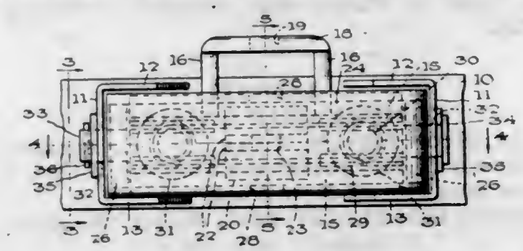


1. In a stove having an ash compartment and a grate above the ash compartment, said ash compartment having a door opening in a side thereof, a frame for the door opening, a transverse member at a side of the ash compartment opposite the door opening, rails connecting the transverse member with the door frame, a bracket supporting the transverse member from the bottom of the ash compartment, a drawer movable into the ash compartment below said rails, flanges on said rails having roller engaging portions, suspension members projecting upwardly from the rear of the drawer, rollers on the suspension members engaging said roller engaging portions of said flanges, wings on said rails extending over the roller engaging portions and under marginal edges of the grate to prevent ashes from falling upon the roller engaging portions of the flanges, and roller means supporting the bottom of the drawer adjacent the door frame.

2,408,922
SEPARATION OF DIOLEFINS BY AZEOTROPIC DISTILLATION
Theodore W. Evans, Oakland, Rupert C. Morris, Berkeley, and Edward C. Shokal, Oakland, Calif., assignors to Shell Development Company, San Francisco, Calif., a corporation of Delaware
No Drawing. Application April 30, 1942, Serial No. 441,246
8 Claims. (Cl. 202—42)

1. A process for separating isoprene from mixtures thereof with one or more compounds from the class consisting of mono-olefins and paraffins having vapor pressures close to that of isoprene which comprises adding isopropylamine to the mixture in a quantity adequate to form constant boiling azeotropes with each of the components thereof, subjecting the resulting mixture to fractional distillation to distill off an azeotropic fraction the hydrocarbon content of which is made up principally of the components of the original mixture other than the isoprene, continuing the distillation at a higher still head temperature to obtain an azeotropic fraction the hydrocarbon content of which predominates in isoprene, and separating the isoprene from said last mentioned fraction.

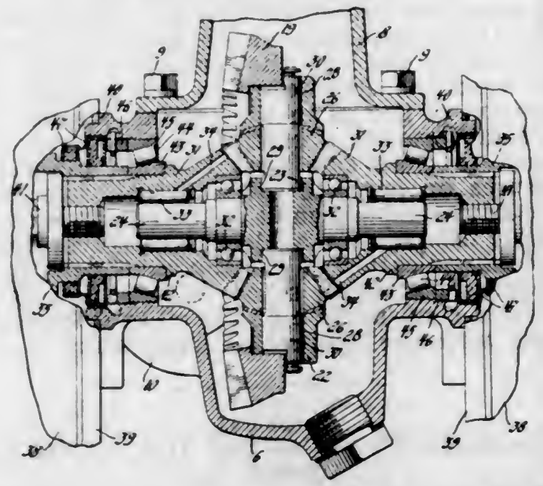
2,408,923
TRAP FOR CHIPS
Charles W. Frederick, Muncie, Ind., assignor to General Motors Corporation, Detroit, Mich., a corporation of Delaware
Application February 12, 1945, Serial No. 577,443
2 Claims. (Cl. 74—606)



1. In a transmission gear casing having a gear therein, a chip trap beneath said gear, said trap being a plate having louvers extending at right angles to the plane of said gear whereby gear rotation forces chips through said louvers and the trap retains them beneath said plate, said plate having a U-shaped tongue, a bolt extended through a wall of said casing and through both branches of said tongue to hold the plate in position.

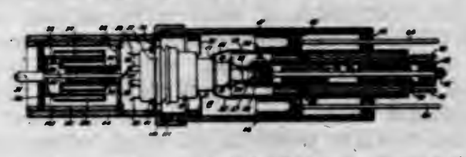
2,408,924
PLANT EXTRACTS AND METHOD OF PRODUCING SAME
Ole Gisvold, Minneapolis, Minn., assignor to Regents of the University of Minnesota, Minneapolis, Minn., a corporation of Minnesota
No Drawing. Application January 17, 1945, Serial No. 573,311
6 Claims. (Cl. 260—619)

1. Process of separating nordihydroguaiaretic acid from a crude extract containing nordihydroguaiaretic acid and impurities dissolved in a low aliphatic ether solvent which comprises adding ethylene dichloride to said extract, evaporating said ether solvent and a portion of said ethylene dichloride until the solution is reduced to the consistency of a thin syrup, crystallizing nordihydroguaiaretic acid and washing impurities from the crystallized nordihydroguaiaretic acid by means of ethylene dichloride.



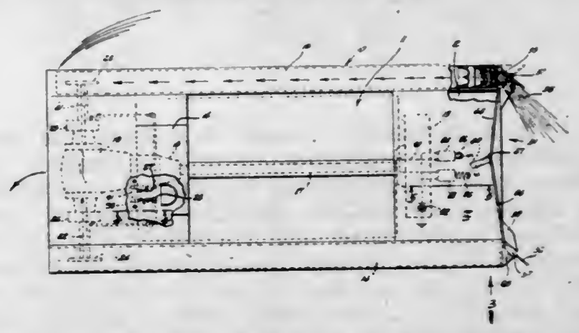
2,408,925
BUFFER AND DRAFT GEAR
John E. Graham, Huntington, W. Va., assignor to The Watt Car & Wheel Company, Barnesville, Ohio, a corporation of Ohio
Application October 10, 1945, Serial No. 621,526
12 Claims. (Cl. 213—9)

1. A buffer and draft gear comprising the combination with the end sill of a car, of a housing secured to and extending forwardly from said end sill, and having an open front end; a draft element slidably mounted in said housing, in front of said end sill; a buffer element slidably mounted in said housing, and projecting from the open front end thereof, said buffer element having side walls with elongated openings therein; compression springs interposed between said draft element and said buffer element and tending to project said buffer element from said housing; and a longitudinally removable locking bar carried by



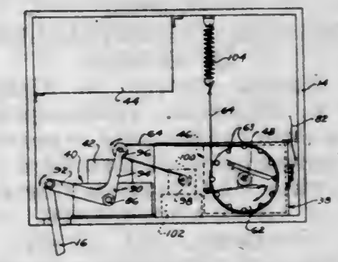
said housing, and extending transversely to the line of draft and parallel to said end sill at a fixed distance therefrom, said bar passing through said elongated openings in the buffer side walls, and in front of said draft element, and serving to limit movement of said buffer element under both buff and draft and movement of said draft element under draft, movement of the latter under buff being limited by its engagement with said end sill.

2,408,926
DRIVE AXLE
Bain Griffith, Detroit, Mich., assignor to General Motors Corporation, Detroit, Mich., a corporation of Delaware.
Application July 15, 1944, Serial No. 545,138
4 Claims. (Cl. 74—311)



1. In combination, a differential gear carrier having centrally disposed bearing trunnions projecting oppositely therefrom, a pair of tubular supports axially spaced on opposite sides of the carrier and surrounding said trunnions, trunnion bearings internally of said tubular supports, side gears on the inner ends of said tubular supports and external splines on the outer ends thereof, a centrally disposed external shouldered abutment on each tubular support, a supporting bearing having an inner race ring seated on said shouldered abutment, a drive coupling hub fitted to said external splines in retaining engagement with said race ring and a retaining means threadedly fitted to the end of the tubular support and engaged with the coupling hub for detachable connection thereof.

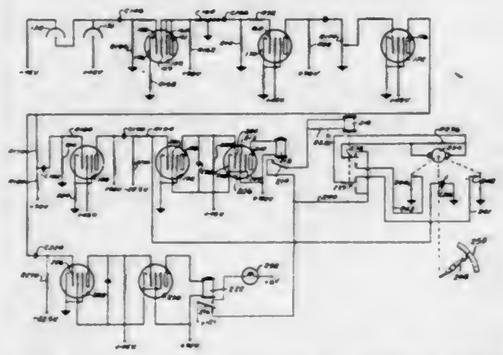
2,408,927
FILTERING ARRANGEMENT
Anatole M. Gurewitsch, Schenectady, N. Y., assignor to General Electric Company, a corporation of New York
Application July 30, 1942, Serial No. 452,946
5 Claims. (Cl. 178—44)



5. In combination, a high frequency system, a conductor for supplying current to a part of said system, and a high frequency filter associated with said conductor, said filter comprising a conductive tube surrounding said conductor and defining with it a coaxial transmission line, means on said conductor for providing a quarter wave discontinuity in said line, and further conductive means concentrically surrounding said tube and insulated therefrom at the frequency of said current for providing a second quarter wave discontinuity serially related to the first.

2,408,928
AMPHIBIAN STEERING MECHANISM
James M. Hait, San Gabriel, Calif., assignor to Food Machinery Corporation, San Jose, Calif., a corporation of Delaware
Application February 15, 1943, Serial No. 475,936
6 Claims. (Cl. 115—1)

1. In a dirigible water craft, the combination of: a hull; propulsion means provided on said hull, said means in its operation discharging a stream of water rearwardly through the air above the surface of the water sustaining said craft; a deflector mounted on said hull to be disposed continuously in said stream; and control means for turning said deflector in said stream to assist in steering said craft.

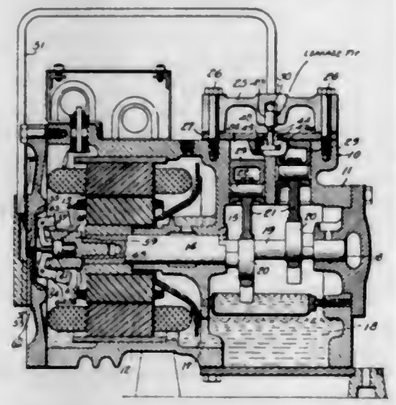


2,408,929
STEERING APPARATUS
Laurens Hammond, Chicago, Ill.
Application October 28, 1942, Serial No. 463,642
18 Claims. (Cl. 114—144)

1. In a steering control apparatus for maintaining a dirigible vehicle headed in a given direc-

tion, said vehicle having steering means for controlling its direction of movement, a servo-motor for operating the steering means, a compass mechanism having a part maintaining a fixed direction, a follow-up element movable with respect to said part, means responsive to relative motion between said part and said element to control the operation of said servo-motor, an operating connection between said servo-motor and said follow-up element, and trim correcting means responsive to the direction of heading of the vehicle with respect to said part for changing the relative position of said follow-up member and said servo-motor.

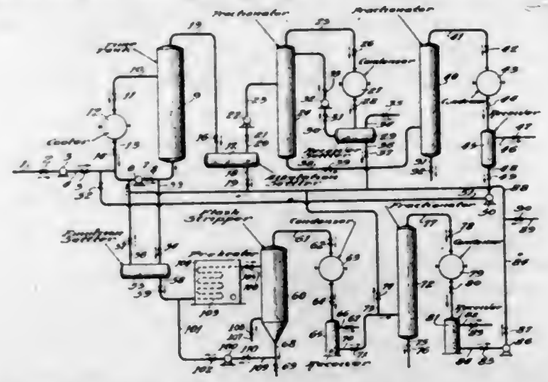
2,408,930
FREQUENCY METER
Laurens Hammond, Chicago, and John M. Hanert, Wilmette, Ill.; said Hanert assignor to Hammond Instrument Company, Chicago, Ill., a corporation of Delaware
Application June 14, 1943, Serial No. 490,746
3 Claims. (Cl. 172—239)



1. In a frequency responsive system, the combination of an amplifier operable to amplify and distort into a substantially rectangular wave form of constant amplitude an input signal of symmetrical wave shape and exceeding a predetermined minimum amplitude, a frequency responsive apparatus coupled to receive the output of said amplifier, a reversible electric motor, control means operated by said frequency responsive apparatus to cause rotation of said motor in one direction when the signal frequency from said amplifier exceeds a set value and to rotate in the opposite direction when the signal frequency is below said set frequency, said control means operating to maintain the motor in operation in one direction or the other at all times when the input signal to the amplifier is of significant amplitude, and means operated by said motor to change the frequency response characteristics of said apparatus in a direction to cause the set frequency of said apparatus to change in a manner to cause it to become the same as the signal frequency.

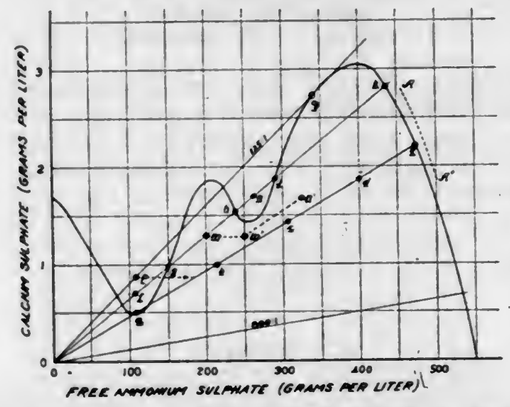
2,408,931
PROCESS FOR STRIPPING LEAD FROM BEARINGS
Robert L. Heath, George A. Fisher, Jr., and Thomas R. Holbrook, Indianapolis, Ind., assignors to General Motors Corporation, Detroit, Mich., a corporation of Delaware
No Drawing. Application March 8, 1943, Serial No. 478,420
3 Claims. (Cl. 75—97)

3. A process of stripping a metallic coating from a steel-backed silver bearing, said coating consisting of a metallic material of the class consisting of lead, lead-tin and lead-indium, which consists in wiping oil from the bearing, removing any rust spots which may be present by buffing, removing any moisture from the bearing, immersing the thus treated bearing in a solution consisting of 95%, by volume, of glacial acetic acid, and 5%, by volume, of an aqueous solution containing 30% hydrogen peroxide until the coating is stripped, thereafter thoroughly rinsing the bearing in water, then in an alkaline solution, then in water and thereafter drying the bearing.



2,408,932
COMPRESSOR UNLOADER
Sylvan Roos Hirsch, Utica, N. Y., assignor to Brunner Manufacturing Company, Utica, N. Y., a corporation of New York
Application May 17, 1944, Serial No. 536,007
8 Claims. (Cl. 230—29)

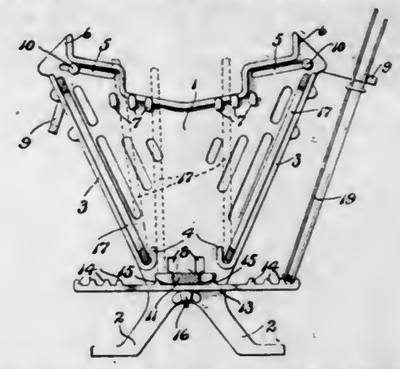
1. In a refrigeration compressor, a head having a chamber provided with a port in communication with the gas passage of the compressor, conduit means in communication with said chamber and with the crankcase of the compressor to convey oil-laden gas from the chamber to the crankcase when the compressor is idle and for condensation of the oil in the conduit means when the compressor is operating, a check valve arranged to close said port through differential pressures on opposite sides thereof, said check valve having a leakage fit at the entrance of said conduit means, and a bleeder valve controlling the communication of the conduit means to the crankcase positioned so as to be sealed by the aforesaid condensation of the oil in said conduit means when the compressor is operating.



2,408,933
HYDROGEN FLUORIDE ALKYLATION PROCESS
John O. Iverson, Chicago, Ill., assignor to Universal Oil Products Company, Chicago, Ill., a corporation of Delaware
Application March 27, 1944, Serial No. 528,206
9 Claims. (Cl. 260—683.4)

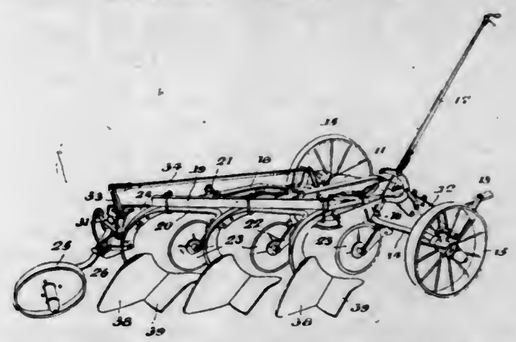
5. A process for the regeneration of contaminated hydrogen fluoride catalyst containing accumulated organic material and water which comprises heating said catalyst under superatmospheric pressure to decompose organic fluorine compounds contained in said catalyst, introducing the heated catalyst into a flash vaporization zone and therein vaporizing hydrogen fluoride and water, removing hydrogen fluoride and water vapors overhead from said zone, withdrawing unvaporized organic material from the bottom of said zone, introducing preheated isobutane vapors into the bottom of said zone to effect the removal of hydrogen fluoride from said organic material by the stripping action of said vapors,

and removing said isobutane vapors overhead along with said hydrogen fluoride and water vapors.



2,408,934
PROCESS FOR RECOVERING BERYLLIUM SULFATE
Bengt R. F. Kjellgren, University Heights, Ohio, assignor to The Brush Beryllium Company, Cleveland, Ohio, a corporation of Ohio
Application April 2, 1942, Serial No. 437,337
In Canada July 3, 1941
1 Claim. (Cl. 23—296)

A process for producing substantially calcium-free beryllium sulfate which includes the steps of producing a solution which at room temperature is substantially saturated with beryllium sulfate and has also in solution calcium sulfate not to exceed 3 grams per liter of solution and an amount of ammonium sulfate not less than about 80 grams per liter of solution and such that the ratio of ammonium sulfate to calcium sulfate is at least approximately 125 to 1; evaporating said solution to a point where a substantial amount of beryllium sulfate is crystallized on cooling but where the resultant increase in concentration of ammonium sulfate will still maintain the calcium sulfate in at least supersaturated solution; and separating the crystals of beryllium sulfate so formed.

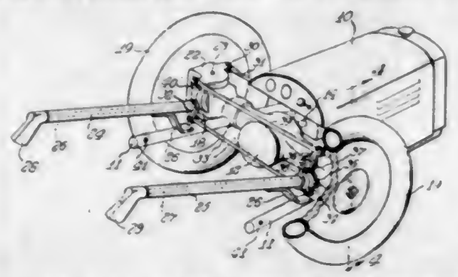


2,408,935
FIRE BASKET
Neil J. Kunst, Grand Rapids, Mich.
Application May 8, 1944, Serial No. 534,560
3 Claims. (Cl. 126—165)

3. A fire basket comprising spaced upwardly outwardly tapered ends, a bottom grate bar extending between the lower narrower portions of said ends but spaced upwardly from the bottoms thereof and detachably connected to said ends, bail member of substantially U-shape extending between and pivotally connected to said ends near their upper edges and serving to tie the ends together, means for retaining said bail members in any of their pivotal positions, a pair of grates extending between said ends, means on said ends for removably receiving said grates in laterally

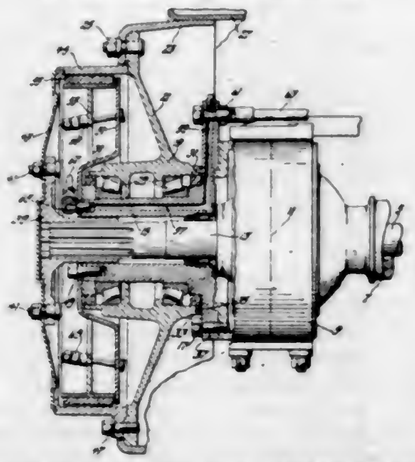
spaced and substantially vertical position, and a supporting bar pivotally connected to said bottom grate bar and adapted to extend outwardly laterally therefrom wherein it serves jointly with either of said bails as a support for a grill and adapted to be moved into alinement with said grate bar.

2,408,936
PLOW
Alfred W. Leland, Rockford, Ill., assignor to J. I. Case Company, Racine, Wis., a corporation
Application March 31, 1942, Serial No. 437,009
4 Claims. (Cl. 97—101)



3. In a wheel plow, the combination of land and furrow wheels and a frame carried by said wheels and including a plurality of plow beams, each beam extending rearwardly for a predetermined distance substantially over and parallel to a furrow wall being formed by the plow, said beams each having a portion curving downwardly and then away from the land, and said beams having a twisted configuration in the parts which depart from the above mentioned direction parallel to the furrow wall, said twisted configuration providing a flared attaching surface disposed at an angle to the direction of said furrows, a foundation plate attached to said attaching surface, a share and moldboard carried by said plate, and a tail wheel carried by one of said beams and disposed in position to support said frame against landward pressure by running against the wall of a furrow being formed by said plow.

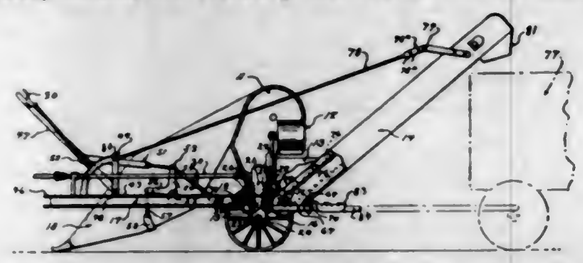
2,408,937
TWO-WHEELED HANDLE GUIDE TRACTOR
Homer S. Lendermon, Searcy, Ark.
Application July 13, 1945, Serial No. 604,805
3 Claims. (Cl. 180—19)



1. A tractor comprising a substantially horizontal frame having an engine supported thereon, an axle, a housing enclosing said axle and

supported on said frame, a drive shaft extending from the engine to said axle, the ends of said housing being enlarged and having yokes formed thereon, wheels having yokes extending therefrom, said wheel yokes being pivoted on said housing yokes, said wheels having axles keyed thereto, universal joints connecting said wheel axles with the extremities of said first named axle, gears connecting said drive shaft with said

first named axle, rigid handle bars supported on said frame, said handle bars being hollow and having rods extending therethrough, said rods having hand grips on the outer extremities thereof, and means connecting said wheel yokes with the inner extremities of said rods for steering said wheels upon turning of said hand grips, said frame having means for attaching a farm tool thereto.

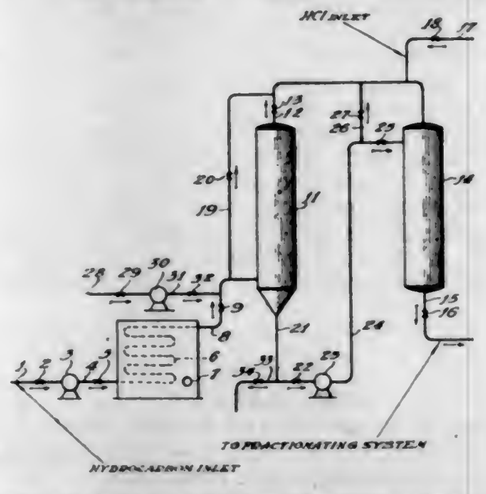


2,408,938
WHEEL BRAKE
Earle S. MacPherson, Detroit, Mich., assignor to General Motors Corporation, Detroit, Mich., a corporation of Delaware
Application July 2, 1945, Serial No. 602,718
4 Claims. (Cl. 188—152)

1. In combination an axle having a horizontally disposed spindle and a flange normal to said spindle, a wheel having a hub rotatable about said axle, sealing means between adjacent inner and outer ends of said hub and axle, tongue and groove means on said hub and flange forming a circuitous path for air adjacent said inner seal, a brake drum attached to the outer face of said wheel, a closure member enclosing the end of said axle and forming, together with said wheel, an enclosure for brake mechanism.

2,408,939
AGRICULTURAL MACHINE
Kenneth L. Magee, Burlington, Iowa, assignor to J. I. Case Company, Racine, Wis., a corporation
Application October 20, 1941, Serial No. 415,732
3 Claims. (Cl. 56—18)

1. In an agricultural machine, a rocking frame member, ground engaging units supporting the frame member, machine units connected with the frame member to be supported thereby and including an elevator pivotally connected with the frame member and a draw bar pivotally connected to the frame member for propelling the same, means for rocking the frame for adjusting

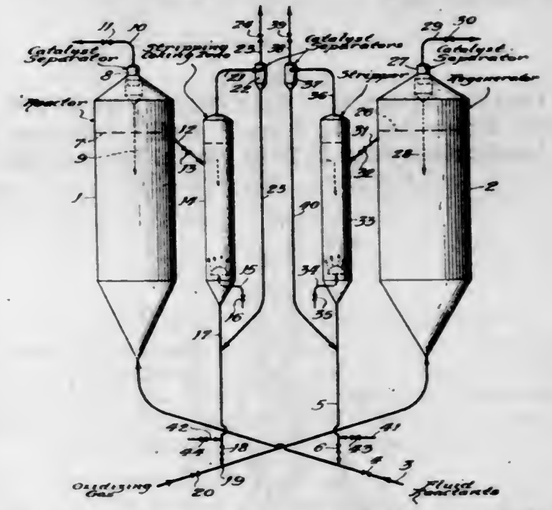


the position thereof relatively to the draw bar, and a connection directly between a point on the draw bar and spaced from the pivotal connection of the elevator to the frame, the elevator, for maintaining the elevator substantially in predetermined relation to the draw bar regardless of the rocking of said rocking frame.

2,408,940
PRODUCTION OF ESTERS
John E. Mahan, Bartlesville, Okla., assignor to Phillips Petroleum Company, a corporation of Delaware
No Drawing. Application June 24, 1944, Serial No. 542,011
6 Claims. (Cl. 260—486)

1. A process for the production of an ester of a carboxylic acid which comprises: reacting a nitrile with an olefin in the presence of water and a strong acid selected from the group consisting of sulfuric acid, phosphoric acid, and benzenesulfonic acid; maintaining the temperature of the reactants in the range from 40° to 200° C.; and maintaining the reactants under pressure sufficient to maintain them in liquid phase.

2,408,941
PRODUCTION OF ISOPARAFFINS
Julian M. Mavity and Walter E. Moss, Chicago, Ill., assignors to Universal Oil Products Company, Chicago, Ill., a corporation of Delaware
Application June 22, 1942, Serial No. 447,956
15 Claims. (Cl. 260—683.5)



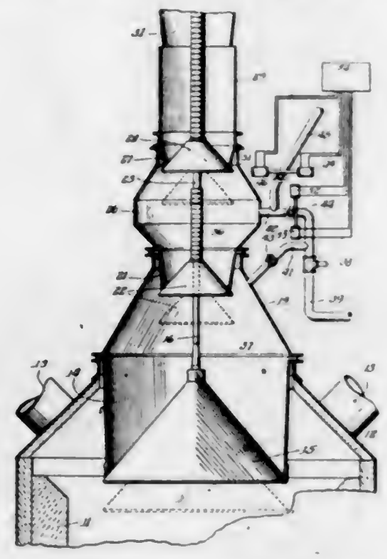
2. In a hydrocarbon conversion process wherein a desired hydrocarbon conversion reaction is catalyzed by means of an aluminum halide catalyst and a hydrogen halide promoter, the continuous method of operation which comprises passing at least a portion of the hydrocarbon to be converted in substantially liquid phase condition and in the absence of said promoter upwardly through a bulk supply of aluminum halide disposed in a catalyst supply zone, dissolving a portion of said aluminum halide in the hydrocarbon during passage thereof through said catalyst supply zone, a relatively small amount of said hydrocarbon being converted to an aluminum halide-hydrocarbon complex which is substantially insoluble in said hydrocarbon but said desired hydrocarbon conversion being substantially precluded by the absence of a promoter, supplying the hydrocarbon effluent containing aluminum halide in dissolved form only from said catalyst supply zone to an independent reaction zone, introducing a hydrogen halide promoter to said reaction zone, withdrawing said complex from the lower portion of said catalyst supply zone substantially as fast as it is formed in order to avoid substantial contamination of the bulk supply of aluminum halide and consequent diminution of the solubility of the aluminum halide in the hydrocarbon, introducing thus withdrawn complex to said reaction zone and therein effecting the desired conversion of said hydrocarbon in the presence of aluminum halide supplied thereto in said complex and in solution in said effluent.

2,408,942
SCALE
David A. Meeker, Troy, and Kenneth C. Allen, Dayton, Ohio, assignors to The Hobart Manufacturing Company, Troy, Ohio, a corporation of Ohio
Original application July 8, 1938, Serial No. 218,240. Divided and this application June 29, 1942, Serial No. 448,964
6 Claims. (Cl. 240—2.11)

1. In a scale of the character described having a frame in which there is rotatably supported a drum chart and with an outer casing overlying said frame and said chart and having means for effectively sealing the interior of the scale against access of dust and foreign matter thereto, the casing being provided with a longitudinally extending opening at one side thereof, the combination of a light transmitting member overlying said opening in the casing, part of said member being translucent and part thereof being transparent to provide for viewing a scale on said drum chart, means for mounting said light transmitting member in fixed position in said casing opening, means for sealing said member in position on said casing opening preventing passage of air and dust therethrough, means for illuminating the surface beneath said light transmitting member, a display member, and means on the outside of said casing for removably receiving said display member in position overlying said opening and said translucent part of the light transmitting member while maintaining the entire interior of said scale effectively sealed when said display member is removed.

2,408,943
CONVERSION OF HYDROCARBONS
Lev A. Mekler, Chicago, Ill., assignor to Universal Oil Products Company, Chicago, Ill., a corporation of Delaware
Application July 17, 1944, Serial No. 545,264
5 Claims. (Cl. 196—52)

1. In a process for the catalytic conversion of hydrocarbons wherein finely divided catalyst particles are contacted in a reaction zone with hydrocarbons at conversion conditions, the resultant contaminated catalyst continuously withdrawn and contacted in a regeneration zone with oxygen-containing gas to remove the contaminant by combustion and the regenerated catalyst continuously withdrawn and returned to the reaction zone, the improvement which comprises passing said contaminated catalyst downwardly prior to its regeneration through a coking zone in countercurrent contact with upwardly flowing hot spent regenerating gas, the amount and temperature of said gas and the time of contact of the catalyst therewith being sufficient to reduce to low volatile coke and vapors the occluded and absorbed liquid hydrocarbons forming a part of the contamination on said catalyst, withdrawing thus treated catalyst from the bottom of said coking zone, removing said regenerating gas from the upper part of said coking zone and separating entrained catalyst therefrom, combining the separated entrained catalyst with catalyst withdrawn from the bottom of said coking zone, and passing the combined catalyst to said regeneration zone.

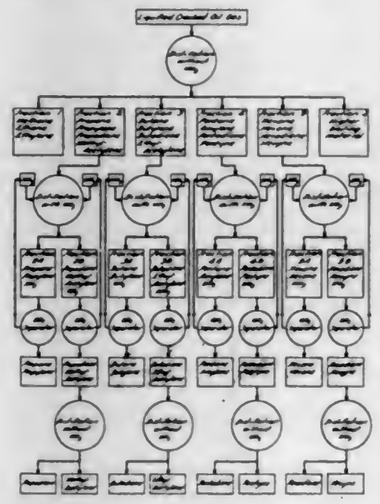


2,408,944
EXPOSURE METER
John H. Miller, Short Hills, N. J., assignor to Weston Electrical Instrument Corporation, Newark, N. J., a corporation of New Jersey
Application August 14, 1944, Serial No. 549,446
3 Claims. (Cl. 88—23)

1. In a photoelectric exposure meter of the calculator type, the combination with a photo-

cell, a light baffle, and an instrument connected to said photocell, said instrument including a moving system for displacing a pointer over a scale plate in accordance with the light energy incident upon said photocell, of a depressor bar, spring means yieldingly pressing said depressor bar upon said pointer to clamp the same to the scale plate, and manually actuated means for lifting said depressor bar to free said pointer for displacement by said moving system; said manually actuated means comprising a release bar slidable along said depressor bar, and pin-and-slot means connecting said depressor bar and said release bar.

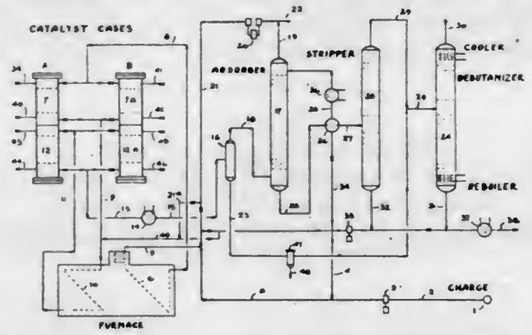
2,408,945
BLAST-FURNACE CHARGING SYSTEM
Albert Mohr, Jr., and John P. Grilli, Chicago, Ill.
Application May 9, 1945, Serial No. 592,908
8 Claims. (Cl. 266—27)



1. In a blast-furnace charging-system having an upper receiving-hopper internally at atmospheric-pressure, its cooperating bell, actuating-means opening and closing said bell intermittently, a lower delivery-hopper and its bell discharging into the top of the furnace, operating-means opening and closing said delivery-hopper bell intermittently, a conduit connecting said hoppers together, and means to feed charging material into said receiving-hopper intermittently, the novel improvement of the combination of means including a valve-construction in said conduit dividing said conduit into an upper chamber and a lower chamber, the latter including said delivery-hopper, means to open and close said valve-construction intermittently, means to feed substantially-nonabradant inert gas under pressure into said lower chamber and maintain the gas-pressure in said lower chamber at all times greater than the gas-pressure in the top portion of the furnace, means to feed substantially-nonabradant inert gas under said specified pressure into said upper chamber, means controlling said gas fed into said upper chamber to maintain equalized gas-pressures on opposite sides of said valve prior to and during the open condition of the latter, means connecting said upper chamber to the external-atmosphere, and means controlling the passage of gas from said first chamber to the atmosphere to provide atmospheric-pressure in said upper chamber on the underside of said receiving-hopper bell prior to and during the open condition of said bell.

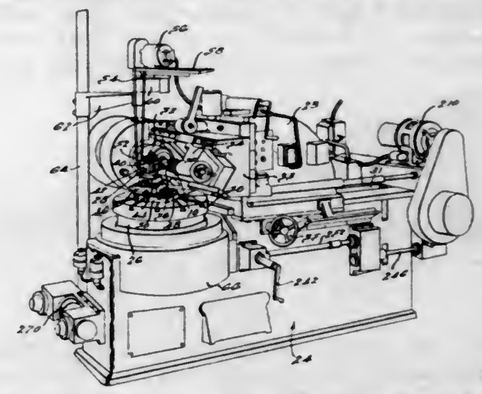
2,408,946
POLISHING WHEEL AND CEMENT THEREFOR
Harold R. Nelson, Detroit, Mich.
No Drawing. Application July 17, 1944, Serial No. 545,399
5 Claims. (Cl. 51—308)

1. A polishing member comprising a fibrous body, abrasive particles adhered thereto, the adhesive for said particles containing 2½% to 6% of finely ground asbestos and about 10% of clay in relation to the solid content.



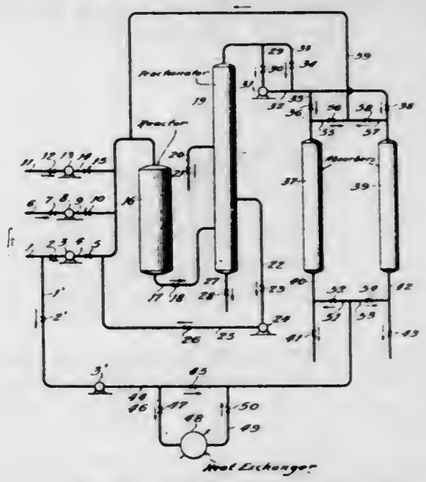
2,408,947
AZEOTROPIC DISTILLATION OF ALIPHATIC HYDROCARBONS HAVING THE FORMULAS C_NH_{2N} AND C_NH_{2N-2} FROM HYDROCARBON MIXTURES COMPRISING SAME
Howard S. Nutting and Lee H. Horsley, Midland, Mich., assignors to The Dow Chemical Company, Midland, Mich., a corporation of Michigan
Application July 29, 1939, Serial No. 287,218
22 Claims. (Cl. 202—42)

1. In a method of separating an unsaturated aliphatic hydrocarbon containing more than 2 and less than 7 carbon atoms in the molecule and having the empirical formula C_nH_{2n-2} from a mixture of hydrocarbons comprising the same and a more saturated hydrocarbon having the same number of carbon atoms in the molecule, the steps which consist in forming a mixture of ammonia with the hydrocarbons to be separated from one another and fractionally distilling the resultant mixture at a pressure not substantially lower than atmospheric pressure, whereby a relatively low boiling azeotrope of ammonia and said more saturated hydrocarbon is formed, the fractional distillation in the presence of ammonia being continued until a substantial proportion of the more saturated hydrocarbon has been separated from the hydrocarbon of formula C_nH_{2n-2}.



2,408,948
CATALYTIC HYDROCARBON REFORMING PROCESS
Cecilio L. Ocon and Ernest A. Ocon, Yonkers, N. Y.; said Cecilio L. Ocon assignor to said Ernest A. Ocon
Application September 14, 1940, Serial No. 356,886
11 Claims. (Cl. 196—52)

1. A process for catalytically reforming low boiling hydrocarbon reactants of gasoline and naphtha boiling range into high anti-knock motor fuels, which comprises heating a low boiling hydrocarbon reactant charging stock jointly with a hydrogen-bearing gas having approximately 50 mol per cent. hydrogen in a heating zone at a superatmospheric pressure ranging from 150 to 800 lbs. per sq. in. ga. to a reaction temperature in the range of 925 to 1050° F. in a short period of time to prevent thermal decomposition, passing the heated reactants into contact with a reforming catalyst bed in an enclosed zone at a suitable space velocity to effect a temperature drop of from 25 to 100° F. more or less by endothermic reaction between points of entry and exit of the reactants, passing the reaction mixture from said catalyst bed to a separate heating zone wherein the reaction mixture is rapidly elevated to a temperature in the range of 925° F. to 1050° F. for a short period of time to prevent thermal decomposition, passing the reheated reaction mixture into contact with a bed of catalyst in an enclosed zone at a suitable space velocity to effect a temperature drop of 25 to 100° F. in the reaction mixture as it is passed therethrough, withdrawing, cooling, and passing said reaction mixture to a flashing zone wherein gas is separated from condensate, passing said gas to an absorption zone, absorbing hydrocarbons having at least 3 carbon atoms to the molecule by contact with a cold lean oil comprising products of the reforming process, passing overhead unabsorbed hydrocarbons as tail gas, compressing and passing a portion of said tail gas to the initial heating zone as the hydrogen-bearing gas, withdrawing, reheating, and passing said lean oil enriched with said absorbed hydrocarbons to a stripping zone for removal of said absorbed hydrocarbons as overhead vapors; and recycling a portion of the stripped lean oil to said heating and catalytic reaction zones to be rapidly heated with said low boiling hydrocarbon reactant charging stock.

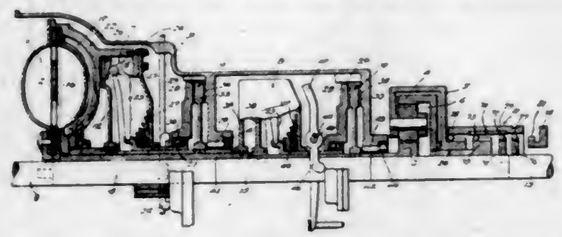


2,408,949
HOB GRINDER
Harry Pelphrey, Detroit, Mich., assignor to Michigan Tool Company, Detroit, Mich., a corporation of Delaware
Application November 26, 1943, Serial No. 511,788
9 Claims. (Cl. 51—33)

1. Apparatus for side-relieving the teeth of hobs comprising, in combination, a rotatable hob support, a rotatable, main table adapted to rotate about an axis perpendicular to the axis of rotation of said hob support, means for rotating said hob support and main table in synchronism, another table mounted on said main table for rotation therewith and driven thereby, means mounting said tables for relative rotative movement with respect to each other, a forming tool positioned to engage the sides of the hob teeth mounted on said another table for rotary movement therewith, and means for causing said relative movement by retarding and advancing the relative rotative position between said tables

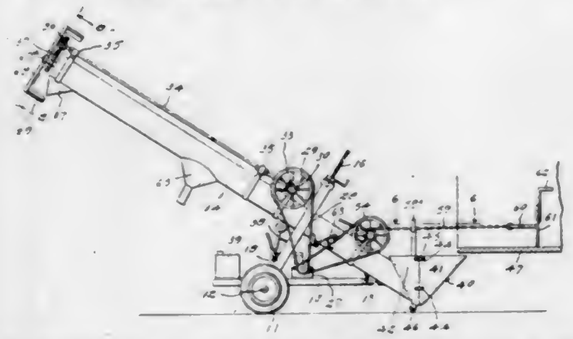
for effecting the relief on the teeth, said last-named means including means providing the driving connection between said tables.

2,408,950
TREATMENT OF HYDROCARBONS
Herman Pines and Herman S. Bloch, Riverside, Ill., assignors to Universal Oil Products Company, Chicago, Ill., a corporation of Delaware
Application October 26, 1944, Serial No. 560,367
5 Claims. (Cl. 260—683.4)



1. In the conversion of hydrocarbons wherein the hydrocarbon charging stock is converted in a reaction zone in the presence of a hydrogen halide, the method which comprises separating from the products of the conversion step a gas mixture containing hydrogen halide and normally gaseous hydrocarbons, contacting said gas mixture with a solid adsorbent to separate hydrogen halide from the mixture by adsorption thereof in the solid adsorbent, subsequently contacting the solid adsorbent with at least a portion of said charging stock in liquid phase to dissolve adsorbed hydrogen halide in said liquid portion of the charging stock, and supplying the resultant hydrogen halide-containing charging stock to said reaction zone.

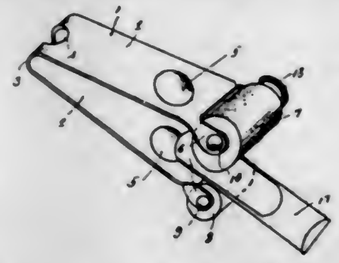
2,408,951
TRANSMISSION AND CONTROL THEREFOR
Willard L. Pollard, Evanston, Ill.
Application September 13, 1943, Serial No. 502,144
7 Claims. (Cl. 74—260)



1. A variable speed transmission and control therefor comprising a three speed forward planetary transmission including a sun gear, a ring gear, a gear carrier and planet gearing mounted

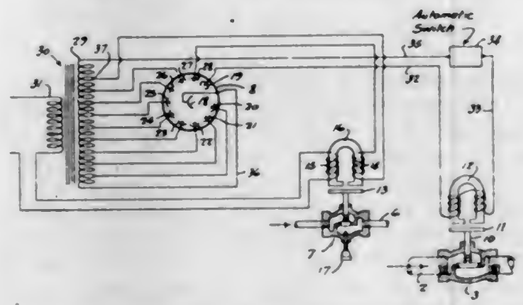
on said gear carrier and meshing with said sun gear and ring gear, clutch means for connecting said sun gear with the power input, clutch means for connecting said ring gear with the power input, means for holding said sun gear and ring gear against reverse rotation when not connect-

ed with the power input, means controlled by speed for automatically disengaging the sun gear clutch and holding the sun gear against reverse rotation and engaging the ring gear clutch for shifting from low to second speed, and manually controllable means for engaging the sun gear clutch for shifting from second to third speed.



2,408,952
GRAIN HANDLING MACHINE
Charlie Raney, Brownfield, Tex.
Application March 2, 1944, Serial No. 524,717
1 Claim. (Cl. 198—233)

A structure of the class described comprising a chute, means to mount said chute at an angle, conveyor means within the chute, displacable hopper means at one end of the chute, means serving as a discharge at the other end of the chute, a distributor member adjacent the latter means for engagement with discharge material, means removably mounting the distributor means on the conveyor means, a mobile frame on which the chute is pivoted, and an auxiliary frame on said mobile frame through which the chute passes, and means suspending the chute from and adjustably mounted on the top of said auxiliary frame, said last mentioned means comprising a screw rod pivoted to the chute and nut means screw-threaded to the rod and bearing on the top of the auxiliary frame.

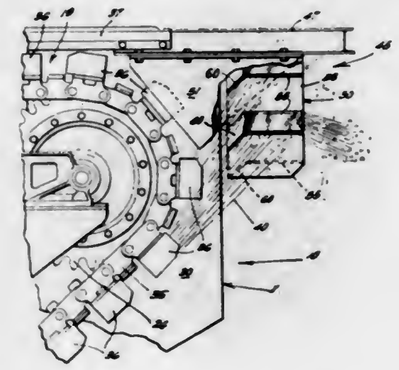


2,408,953
REED SANDER
Joseph E. Ray, Denver, Colo.
Application May 18, 1945, Serial No. 594,437
2 Claims. (Cl. 51—186)

1. A sander comprising a body formed from a strip of resilient sheet material folded midway its length to form arms connected at their rear ends by a spring-forming bridge, front ends of the arms being formed with ears at opposite sides thereof, a pressure roller rotatably mounted between the ears of one arm, an elastic roller between the ears of the other arm, an abrading sleeve fitting snugly about said elastic roller, a bolt passing through the elastic roller and the ears between which it is located and having a non-circular portion engaged through a similarly shaped opening in one ear to prevent rotation of the bolt, and a nut carried by said bolt and tightened to draw the ears between which the

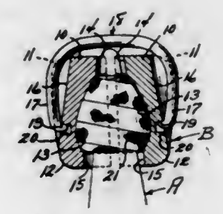
elastic roller is located towards each other and apply pressure to opposite ends of the elastic roller to compress the elastic roller longitudinally and expand it diametrically for binding engagement with the bolt and the sleeve to prevent turning of the elastic roller and the sleeve.

2,408,954
FUEL SUPPLY SYSTEM
William A. Ray, Glendale, Calif., assignor to General Controls Co., a corporation
Application June 8, 1944, Serial No. 539,377
9 Claims. (Cl. 158—117.1)



1. In a system of the character described, a burner, an electrically operated valve for controlling the flow of fuel to the burner, a photoelectric tube having a photosensitive cathode and adapted to be energized from a source of alternating current, said device serving to rectify the alternating current, and supplying the resultant unidirectional current to operate said valve, and a light source affecting the cathode for controlling the flow of said unidirectional current.

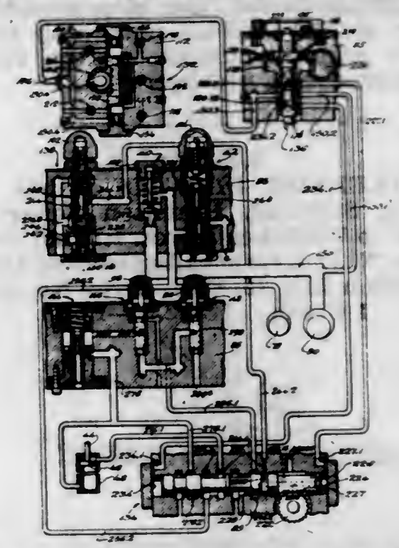
2,408,955
AMPHIBIAN STEERING DEVICE
George A. Reynolds, Jr., Los Angeles, Calif., assignor to Food Machinery Corporation, San Jose, Calif., a corporation of Delaware
Application August 7, 1943, Serial No. 497,725
8 Claims. (Cl. 115—1)



1. In a dirigible water craft the combination of: a hull; right and left propulsion means provided on opposite sides of said hull, each of said means in its operation discharging a stream of water non-parallel with the fore and aft axis of said craft; means for controlling the operation of said right and left propulsion means to drive these at the same or different speeds; and deflector means disposed in the paths of said streams at angles to oppositely intercept and deflect said streams from their course said deflector means being disposed substantially parallel with said axis whereby the driving of one

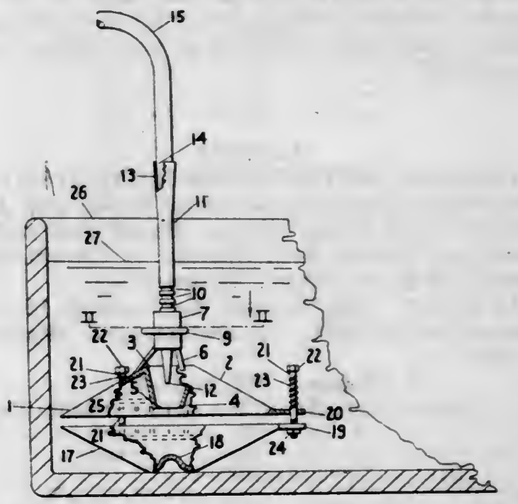
of said propulsion means at a higher speed than the other causes an unbalanced turning moment to be produced by the reaction of the deflector

means to the stream produced by the faster moving propulsion means without thereby producing a substantial moment tending to retard the forward motion of the craft.



2,408,956
HORN WEIGHT
Fred Romain, Chester, Mont.
Application May 24, 1944, Serial No. 537,126
2 Claims. (Cl. 128—76)

1. A device of the kind described, comprising a pair of similarly constructed weight members having concaved upwardly tapered recesses on the inner faces thereof for disposition in opposed matched relation to each other on a horn of an animal, said recesses merging into relatively shallow and deep notches respectively, opening through the top and bottom areas of the members to permit the proper fitting of said members to said horn, means on the horn conforming to the contour of said recesses for anchor seating of the members thereon, and a springy clamping means engaging only the members for making fast the seating of the members.

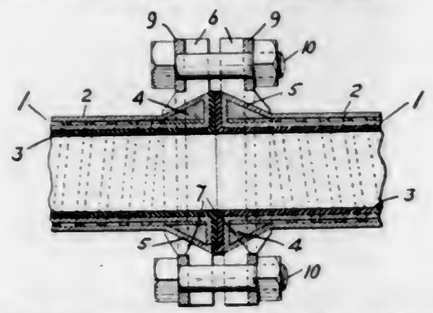


2,408,957
REMOTE CONTROL APPARATUS FOR MACHINE TOOLS
Robert A. Schafer and Ralph B. Rodal, Richmond, Ind., assignors to National Automatic Tool Company, Inc., Richmond, Ind., a corporation of Indiana
Application January 15, 1944, Serial No. 518,366
12 Claims. (Cl. 121—45)

4. A positioning motor mechanism comprising a body having a cylinder formed therein, an elongated piston reciprocable in said cylinder, a plurality of pairs of ports in said cylinder, each pair of ports being spaced longitudinally of the cylinder a distance slightly less than the length of said piston, solenoid operated valves selectively operable to open a passageway from their associated pairs of ports to a point of low pressure, and means for supplying a hydraulic fluid under

pressure to the opposite ends of said cylinder at a controlled rate.

2,408,958
BEARING SERVICING EQUIPMENT
William H. Smith, Evanston, Ill.
Application June 12, 1944, Serial No. 539,849
3 Claims. (Cl. 134—94)

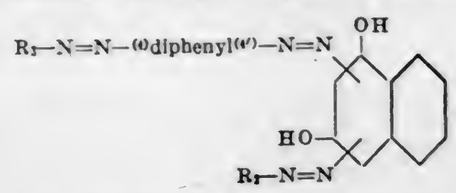


1. For a bearing washer, a submersible holder comprising a pair of relatively axially shiftable complementally-tapered seat-providing members adapted to center a bearing therebetween with the bearing effective to hold the members spaced to provide a spill opening outwardly therefrom, a container providing a pool of liquid in which the members may hold the bearing, and an injector-acting fluid supply connection to the holder adapted to deliver fluid into the liquid inwardly of the bearing, and to recirculate spill from the opening through the holder.

2,408,959
PRODUCTION OF PRIMARY AMINES
Lou A. Stegemeyer, Cincinnati, Ohio, assignor to Emery Industries, Inc., Cincinnati, Ohio, a corporation of Ohio
No Drawing. Application December 16, 1942, Serial No. 469,217
2 Claims. (Cl. 260—583)

1. In the process of manufacturing primary amines by catalytically hydrogenating nitriles in

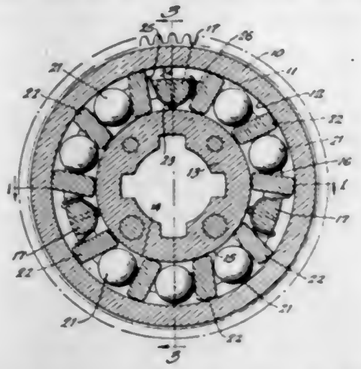
the presence of ammonia and distilling said primary amines from the secondary amines formed in the hydrogenation, the step of adding the secondary amine residues remaining after distilling the primary amines to each succeeding batch of nitrile to be hydrogenated.



2,408,960
FLEXIBLE PIPE COUPLING
William L. Stivason, Hamilton Square, N. J., assignor to Whitehead Bros. Rubber Company, Trenton, N. J., a corporation of New Jersey
Application July 25, 1944, Serial No. 546,511
1 Claim. (Cl. 285—138)

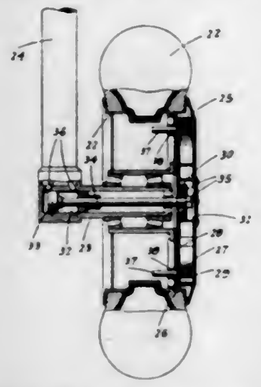
A flexible pipe coupling including abutting ends of lengths of flexible pipe or hose, split rings applied to the outwardly flaring ends, continuous rings of greater diameter than the flaring end of the pipe or hose and nuts and bolts arranged through both rings, the parting line of the split disposed axially through the bolts in combination with the split ends of the rings and with the nuts of the bolts.

2,408,961
TRISAZO METALLIZABLE DYESTUFFS
Fritz Straub, Kaiseraugst, near Basel, and Jakob Brassel and Hans Mayer, Basel, Switzerland, assignors to the firm Society of Chemical Industry in Basle, Basel, Switzerland
No Drawing. Application September 10, 1943, Serial No. 501,868. In Switzerland September 2, 1942
6 Claims. (Cl. 260—172)



1. Trisazo dyestuffs of the general formula

wherein R_3 stands for the radical of a coupling component containing the salicyclic acid grouping and R_2 stands for the radical of a diazo component containing a member selected from the group consisting of OH and COOH in ortho position to the diazonium group, the said diazo components being selected from group consisting of diazo components of the benzene and naphthalene series.

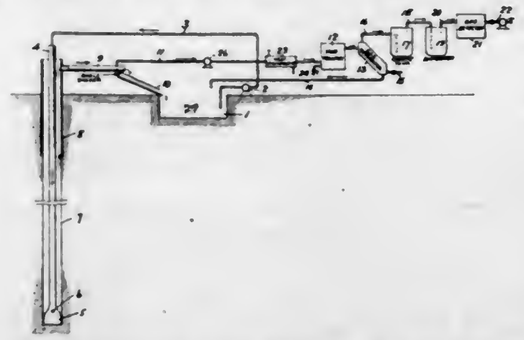


2,408,962
ONE-WAY CLUTCH AND BEARING
Carl E. Swenson and Adiel Y. Dodge, Rockford, Ill.
Application May 23, 1945, Serial No. 595,266
10 Claims. (Cl. 192—45.1)

1. A one-way clutch and bearing construction comprising inner and outer races having side flange portions separated by grooves, bearing members riding on the flanges and axially located relative to the races by the flanges, a cage having side rings engaging the bearing mem-

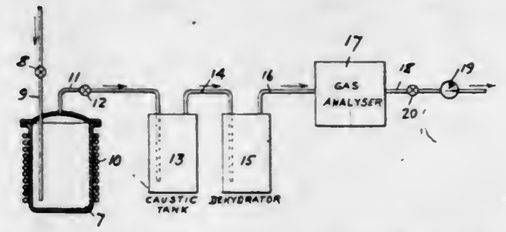
bers and axially located relative to the races by the bearing members, and tiltable grippers engageable with the bottoms of the grooves, the grippers engaging the cage side rings and being located thereby between the sides of the grooves.

2,408,963
AIRCRAFT LANDING WHEEL ROTATOR
Leslie L. Westcamp, North Sacramento, Calif.
Application June 14, 1943, Serial No. 490,711
3 Claims. (Cl. 244—103)



1. In combination with an aircraft landing gear structure which includes a spindle and a wheel journaled on said spindle, one side of the wheel being unobstructed; a circular rotator unit for the wheel, the unit being of limited axial extent and the wheel having a rotator unit receiving well therein open to said one side, the unit normally being disposed in the well, separate power actuated means operative to move said unit in and out of the well, the unit when out of the well being in the path of and rotated by the airstream, and a drive connection between the rotator unit and said wheel.

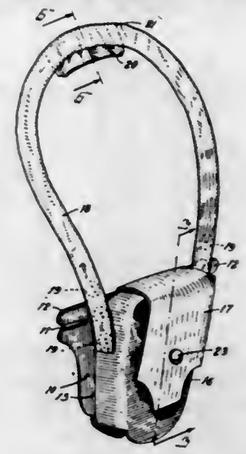
2,408,964
METHOD OF LOGGING WELLS
William E. Winn, Dallas, Tex., and Patrick F. Dougherty, Chester, Pa., assignors to Sun Oil Company, Philadelphia, Pa., a corporation of New Jersey
Application August 22, 1941, Serial No. 407,955
3 Claims. (Cl. 23—232)



1. The method of logging oil and gas wells that are drilled with the aid of a circulating drilling fluid in order to determine a light hydrocarbon content of the drilling mud emerging from the well indicative of the nature of the formation penetrated regardless of variations during drilling

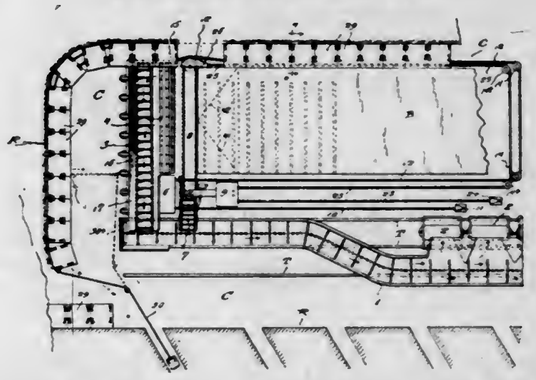
in the properties of the mud causing variations in its ability to retain hydrocarbons, which comprises diverting a minor portion of the circulating drilling fluid from the main stream, subjecting said minor portion to a treatment which comprises the addition thereto of materials which will impart uniform hydrocarbon-retentive properties to the minor portion under the same fixed

standard external conditions of stripping, subjecting the thus treated drilling fluid to the stripping action of a gas to remove hydrocarbons, separating the mixture of stripping gas and hydrocarbons from the drilling fluid and subjecting said mixture to further treatment including an analysis to determine the amount of removed hydrocarbons.



2,408,965
METHOD OF LOGGING WELLS
William E. Winn, Dallas, Tex., and Patrick F. Dougherty, Chester, Pa., assignors to Sun Oil Company, Philadelphia, Pa., a corporation of New Jersey
Application August 22, 1941, Serial No. 407,956
2 Claims. (Cl. 23—232)

1. The method of logging oil wells which comprises treating the drilling mud delivered from the well to separate therefrom the drilling fluid and the cuttings, intimately mixing said cuttings with gaseous carbon dioxide at a superatmospheric pressure effective to cause the carbon dioxide to permeate said cuttings, lowering the pressure on the cuttings to remove therefrom carbon dioxide and any hydrocarbons admixed therewith and subjecting the mixture to a treatment including an analysis to determine the amount of hydrocarbons, thereby ascertaining the content of such hydrocarbons in the formation from which the cuttings were obtained.

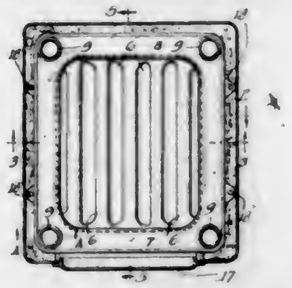


2,408,966
CARRYING POCKET FOR HEARING AIDS
Martin H. Brede, Denver, Colo.
Application June 29, 1945, Serial No. 602,393
2 Claims. (Cl. 224—5)

1. A carrying pocket for hearing aids comprising: a backing plate; vertical spaced-apart slots extending upwardly from the bottom of said backing plate; horizontal spaced-apart slots extending across the upper portion of said backing plate; a pocket, the ends of which are carried in the vertical slots; a closing flap for said pocket extending through said horizontal slots to lock the pocket to the backing plate; a shoulder strap;

and means on the extremities of said shoulder strap engaging in the vertical slots of the backing plate for removably attaching the pocket thereto.

2,408,967
COAL MINING APPARATUS
Clarence E. Brown, Clarksburg, W. Va.
Application September 21, 1945, Serial No. 617,706
4 Claims. (Cl. 262—30)

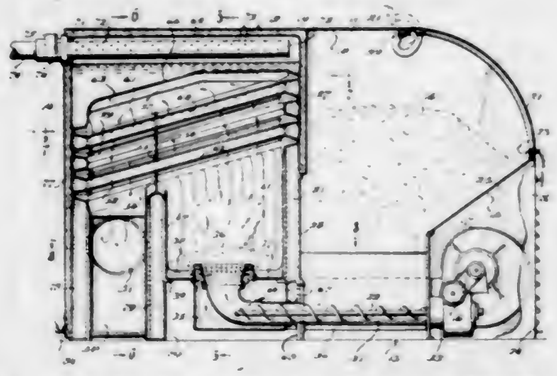


1. In combination, a rotatable, endless-band coal cutting machine adapted to produce convergent, angular, horizontal cuts through the corners of the inner end of a coal block; means for operating and moving said cutting machine to produce convergent, horizontal, angular cuts; powered rotatable scoops adapted to be positioned adjacent said cutting machine; an endless, rotatable coal carrier positioned longitudinally adjacent said scoops; a movable base adapted to support said carrier and scoops in common; powered means for advancing said base as the work progresses; powered means for advancing said cutting machine as the work progresses; a tipple adapted to receive the mined coal from said carrier; and a movable, sectional revetment adapted to barricade the walls of the mine room in the vicinity of the operations.

2,408,968
BOILER CONSTRUCTION
Robert C. Cross, Riverside, Ill., assignor to Sears, Roebuck and Co., Chicago, Ill., a corporation of New York
Application April 7, 1944, Serial No. 529,986
2 Claims. (Cl. 122—218)

1. A boiler section comprising a unitary casting affording higher and lower header sections,

inclined flues connecting said header sections of tear-drop cross-section and having their small radius curvature uppermost, said flues being filleted at their point of junction with said



higher header in non-symmetrical radii so as to present minimum flow resistance to contained fluid in a direction outwardly of the transverse center of said boiler section.

2,408,969

STOKER BOILER UNIT

Robert C. Cross, Riverside, and George W. Smardon, Lombard, Ill., assignors to Sears, Roebuck and Co., Chicago, Ill., a corporation of New York

Application August 7, 1944, Serial No. 548,434
4 Claims. (Cl. 122—4)

4. In a base casting for stoker operated hot water or steam boilers, a unitary casting comprising an inclined plane upper extremity defined by four vertical wall portions each water jacketed and provided with intercommunication orifices, an intermediate dividing wall section connecting with the side walls of said casting also water jacketed and intercommunicating with said water jacketing of said side wall sections, portions of said side walls and the forward wall of said base casting being undercut so as to provide a nethermost clearance whereby is afforded accessibility for the retort mechanism of a fuel feeding stoker, and a fire bed supporting plate having a central opening for admitting a retort mechanism and supported by ledge formations extending inwardly perimetrically from said side walls, front wall and said intermediate wall section.

2,408,970

BUTADIENE PURIFICATION

Thomas F. Doumani, Long Beach, and Davis A. Skinner, Compton, Calif., assignors to Union Oil Company of California, Los Angeles, Calif., a corporation of California

No Drawing. Application December 16, 1943, Serial No. 514,546
5 Claims. (Cl. 260—681.5)

1. A process for the purification of diolefins which are contaminated by the presence of relatively small proportions of acetylenes of approximately the same boiling points, which comprises reacting a hydrocarbon mixture containing said acetylenes and diolefins with water in the vapor phase in the presence of a catalyst at a temperature above about 300° C. and a partial pressure of diolefins below about 100 mm. of mercury, whereby the acetylenes are converted to oxygenated derivatives, and the diolefins are substantially unchanged.

2,408,971

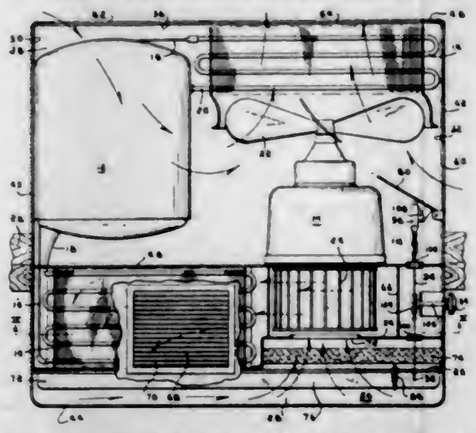
SLUSHING COMPOSITION

Gordon W. Duncan, Scotch Plains, N. J., assignor to Standard Oil Development Company, a corporation of Delaware

No Drawing. Application December 27, 1941, Serial No. 424,595
8 Claims. (Cl. 106—14)

1. A slushing oil composition consisting of a petroleum fraction to which is added degras, a metal salt of oil-soluble sulfonic acids derived from petroleum by treating petroleum stocks with concentrated sulfuric acid and from 1 to 10% of a compound having the formula

R—O—alkylene—O—R'



wherein R is selected from the group consisting of hydrogen and alkylol radicals; and R' is selected from the group consisting of hydrogen, alkyl, and aryl radicals.

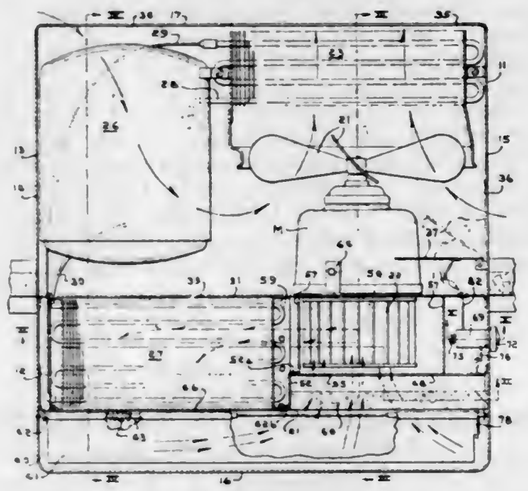
2,408,972

AIR CONDITIONING APPARATUS

Arthur H. Eberhart, Springfield, Mass., assignor to Westinghouse Electric Corporation, East Pittsburgh, Pa., a corporation of Pennsylvania

Application December 6, 1944, Serial No. 566,797
5 Claims. (Cl. 62—129)

1. In a room air conditioning unit, a casing having a first portion and a second portion, a first heat exchanger in said first portion, a second heat exchanger in said second portion, an outside air inlet for admitting air from the outside atmosphere to said first portion, an air outlet leading from said first portion to the outside atmosphere, a fan for drawing outside air through said outside air inlet into contact with said first heat exchanger and discharging it through said outlet to the outside atmosphere, a room air inlet for admitting air from a room the air of which is to be conditioned to said second portion, a room air outlet leading from said second portion for discharging air to said room, a fan for drawing room air through said room air inlet into contact with said second heat exchanger and discharging it through said room air outlet back into the room, a passage connecting said room air inlet with said outside air inlet and said outside air outlet,



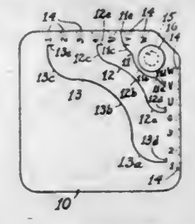
and means for regulating the flow of outside air or room air into contact with either of said heat exchangers and into the room or to the outside atmosphere, comprising a first damper for controlling said outside air inlet, a second damper for controlling said passage, and a third damper for controlling said room air inlet, and actuating means for positioning said dampers, said actuating means and said dampers being so constructed and arranged that, in one position thereof said inlets are open and said passage is closed, whereby outside air is circulated around said first heat exchanger and room air is circulated around said second heat exchanger, in a second position of said actuating means and said dampers said room air inlet and said passage are open and said outside air inlet is at least partly closed, whereby room air is withdrawn through said room air inlet and said passage and discharged to the atmosphere, and, in a third position of said dampers and said actuating means, said outside air inlet and said passage are open and said room air inlet is at least partly closed, whereby outside air is drawn through said outside air inlet and said passage into contact with said second heat exchanger and is discharged into said room.

2,408,973

AIR CONDITIONING APPARATUS

Clifford S. Cody, Springfield, Mass., assignor to Westinghouse Electric Corporation, East Pittsburgh, Pa., a corporation of Pennsylvania

Application May 8, 1943, Serial No. 486,136
7 Claims. (Cl. 62—129)



1. In a room air conditioning unit, a casing having an outer compartment and an inner compartment, a refrigerant condenser in said outer compartment, a refrigerant evaporator in said inner compartment, said evaporator being operatively connected to said condenser, there being a passage connecting said compartments, an opening leading from said outer compartment to the outside atmosphere, a room air inlet leading from a room to said inner compartment and a conditioned air outlet leading from said evaporator to said room, a blower for drawing room air through said room air inlet into contact with said evaporator and discharging it into the room through said conditioned air outlet, a damper for controlling the inner end of said passage and said room air inlet, and actuating means for said damper, said damper and said actuating means being so constructed and arranged that in one position of said actuating means said damper closes said room air inlet and in a second position of said actuating means said damper closes the inner end of said passage and in a third position of said actuating means, said damper is in nonclosing position with reference to said room air inlet and the inner end of said passage.

2,408,974

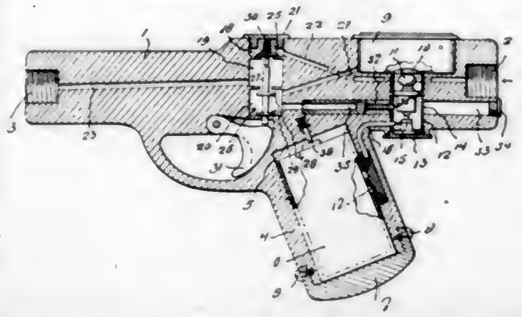
PLACE MARKER FOR BOOKS AND THE LIKE

Joseph Eifel, Chicago, Ill.

Application June 1, 1944, Serial No. 538,251
4 Claims. (Cl. 116—119)

1. A marker for removable application to an information sheet, comprising a piece of sheet material having a margin portion projecting in use beyond the edge of the information sheet to which it is applied and also having a body portion which in use overlaps said information sheet, said piece of sheet material having a continuous first cut therethrough with the ends of said cut at the said margin portion, said first cut being contained in the body portion of said piece of sheet material and leaving the edges of said sheet material made by said cut in engagement with each other, said first cut at its end portions extending in directions substantially perpendicular to the adjacent margin portion of said piece of sheet material and between its end portions having a change of direction for separating the adjacent edges of said first cut by flexure of said piece of sheet material, said piece of sheet material also having at the ends of said first cut short additional cuts extending from the ends of said first cut and substantially parallel with said margin portion and substantially perpendicular respectively to the end portions of said first cut, whereby maximum gripping effect is exerted by the adjacent edges of said first cut on an engaged information sheet and said short extension cuts afford a stop in applying the piece of sheet material to an information sheet and at the same time prevent damaging said engaged information sheet and prevent tearing of said piece of sheet material at the ends of said first cut.

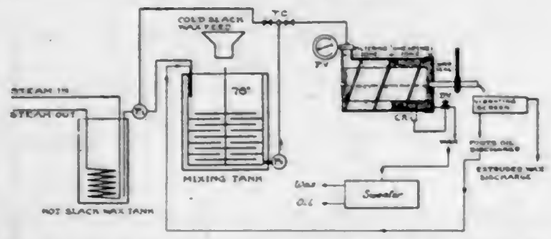
2,408,975



PROCESS FOR THE SEPARATION OF ORGANIC BASES

Karl Henry Engel, West Englewood, N. J., assignor, by mesne assignments, to Allied Chemical & Dye Corporation, a corporation of New York

No Drawing. Application July 19, 1940, Serial No. 346,347
15 Claims. (Cl. 260—290)

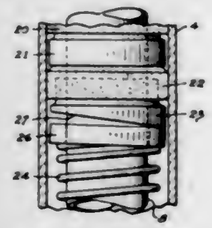


1. In a process for isolating a coal tar base from a mixture containing material amounts of a plurality of such bases, the steps which comprise reacting said mixture with phosphoric acid in a medium in which the saturation solubility of the phosphate of the base to be isolated is low to form the phosphate of said base together with other base phosphates, inoculating the reaction mixture with a crystal of the phosphate of the base to be isolated to cause precipitation of said phosphate from the reaction mixture, separating the base phosphate thus precipitated, and converting the phosphate to the free base.

2,408,976
TIRE INFLATING AND TESTING DEVICE
John Forbragd, Garden City, S. Dak.
Application July 6, 1944, Serial No. 543,662
1 Claim. (Cl. 137—69.5)

A pneumatic tire inflating and testing device comprising an elongated metallic body having controllable passageways including inlet and outlet passageways for connection with an air line and with a tire valve respectively, a lateral pistol grip handle extension on said body, an illuminable gauge mounted in the body and readably exposed at one side of the body, an air passageway for said gauge, said body having a transverse chamber therein adjacent said gauge, an electric lamp mounted in and insulated from the chamber walls and arranged for illuminating the gauge, an electric cell mounted in the handle extension and generally insulated from the body and having one of its electrical poles connected to one circuit terminal of the lamp, said cell having its other electrical pole connected to the body, a metallic, normally spring-pressed, air-actuated piston slidable longitudinally in the body adjacent said transverse lamp containing chamber, an air passageway for said piston, a pin on an end of said piston engageable with the other circuit terminal of the lamp for electrically connecting said lamp to the body at the will and control of the operator under pressure of air from the outlet passageway, and manually operable valve controlled means in the body common to all of the body passageways for selectively connecting the inlet passageway to the outlet passageway or for simultaneously connecting said outlet passageway to the gauge to actuate the gauge and to said piston for causing illumination of the lamp and the gauge.

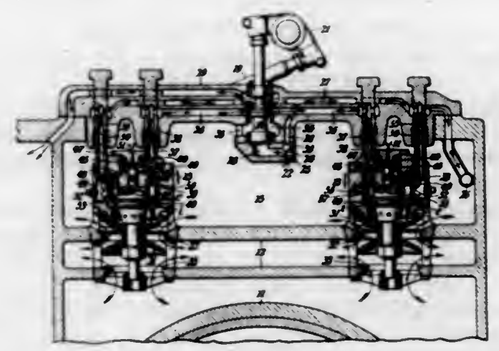
2,408,977
TREATMENT OF WAX-OIL MIXTURES
Adam H. Gebauer, Short Hills, N. J., assignor to Tide Water Associated Oil Company, Bayonne, N. J., a corporation of Delaware
Application December 17, 1943, Serial No. 514,619
13 Claims. (Cl. 196—19)



1. A continuous process for deoiling wax which comprises continuously supplying a flowable stream of a wax-oil slurry under pressure to a filtering surface, propelling the slurry along said filtering surface in a confined channel while progressively filtering oil therefrom to separate a semi-solid wax and while progressively compacting the separated wax to form a seal of deoiled wax at the end of said channel, and continuously removing deoiled wax from said seal at a rate substantially equal to its rate of formation.

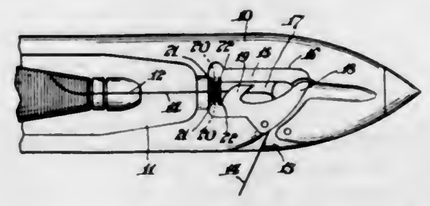
9. In apparatus of the character described, the combination of means for forming a wax-oil slurry, an extrusion filter including a filtering medium through which the oil is extruded and means for continuously propelling the wax filtering out on said medium along the length thereof, means for continuously introducing the slurry to the inlet end of the filter at a pressure such as to cause the wax particles to agglomerate and to filter out as a plastic wax product and for continuously and separately discharging the wax product and the oil filtrate from the other end of the filter, and means for progressively compacting the plastic wax product as it is propelled through the filter to a selected consistency such that the compacted wax forms a solid wax seal at the discharge end of the filter which prevents channeling of the initially plastic wax product.

2,408,978
WOOD PRESERVATIVES
Bror Olof Häger, Stockholm, Sweden, assignor to Bolidens Gruvaktiebolag, Stockholm, Sweden, a joint-stock company limited of Sweden
No Drawing. Application February 3, 1943, Serial No. 474,627. In Sweden January 13, 1941
9 Claims. (Cl. 167—38.5)



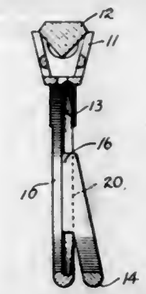
1. A wood preservative composition characterized in that it contains (*a*) an arsenic compound selected from the class consisting of arsenic acid and alkali metal arsenates, (*b*) a fluorine compound selected from the class consisting of hydrofluoric acid and alkali metal fluorides, (*c*) a chromium compound selected from the class consisting of chromic acid, alkali metal bichromates and alkali metal chromates, and (*d*) at least one water-soluble salt of at least one of the metals selected from the class consisting of Ca, Mg, Zn and Al; said composition being further characterized in that, upon treatment of wood, both difficultly soluble arsenates and difficultly soluble fluorides are formed in the wood in situ.

2,408,979
PUMP PLUNGER
Sherman H. Holt, Tulsa, Okla.
Application February 22, 1945, Serial No. 579,263
3 Claims. (Cl. 309—4)



3. A plunger comprising a vertical tube, a helical packing member wound on said tube, means rigidly mounted on said tube against one end of said packing, a collar slidably mounted on said tube against the other end of said packing, a packing cup slidably mounted on said tube on the other side of said collar, a cup ring slidably mounted on said tube in engagement with said cup, a thin backing ring slidably mounted on said tube in engagement with the cup ring, and a coil spring mounted on said tube and urging said rings and cup toward said collar, the cup ring having its end face which is adjacent the backing ring inclined to its axis, whereby any tendency of the packing cup to move the rings axially and compress the spring will cant the backing ring into binding engagement with said body and prevent such movement.

2,408,980
CUSHIONING MEANS FOR STEAM-ACTUATED VALVES
Lloyd B. Jones, Hollidaysburg, Pa.
Application March 3, 1944, Serial No. 524,851
7 Claims. (Cl. 121—132)

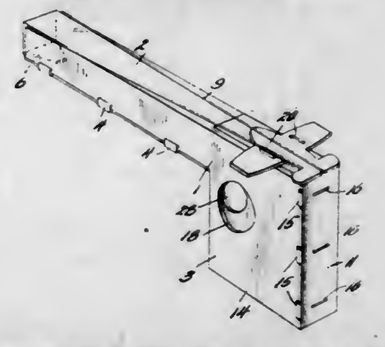


1. In a locomotive engine having piston-operated poppet-valves controlling the admission and exhaust of pressure-steam to the engine steam chest and cylinder, with individual pilot-valves effective to open and close said poppet-valves, means for cushioning the terminal impacts of the operating-piston, said means comprising a relatively small individually and axially-shiftable piston, said piston being spacedly-aligned in respect to the poppet-valve operating piston at one end thereof; means in the body of the poppet-valve defining a circumferential cavity about and intermediate the ends of the operating piston; and conduit means with associated ports controlling supply of pressure from the cylinder steam chest to and from the small axially-shiftable piston, as well as to the circumferential cavity for effecting positive cushioning of the poppet-valve operating-piston when approaching the limits of its movement.

2,408,981
LOOM SHUTTLE
John J. Kaufmann, Jr., Greenville, S. C., assignor to Steel Heddle Manufacturing Company, Philadelphia, Pa., a corporation of Pennsylvania
Application April 12, 1944, Serial No. 530,603
4 Claims. (Cl. 139—220)

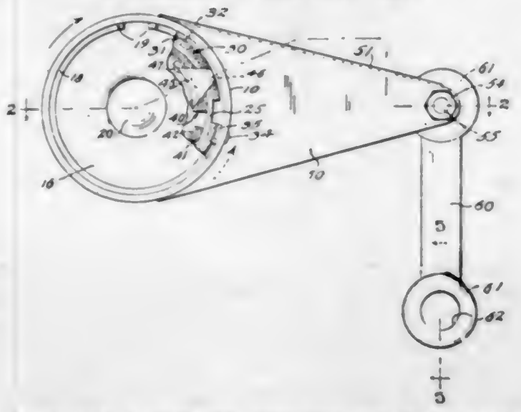
4. In a loom shuttle having a threading block mounted in one end thereof and provided with a longitudinal thread channel through which the filling yarn passes from the bobbin to the outlet, and a strip of fur mounted at the entrance end of the threading block on at least one side thereof, the hair filament of said fur being disposed at a downward inclination.

2,408,982
FINGER RING CONSTRUCTION
Aaron Koenig, Far Rockaway, N. Y.
Application November 8, 1944, Serial No. 562,438
4 Claims. (Cl. 63—16)



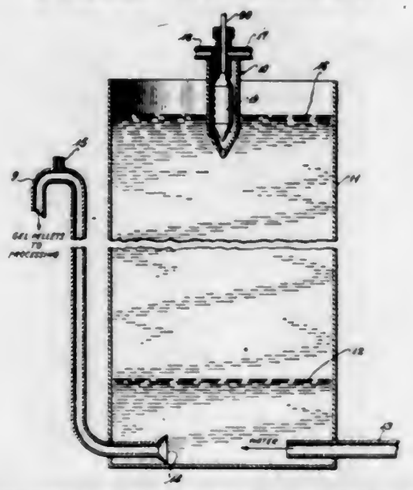
1. A finger ring having a solitaire setting for a gem and having, in combination, a wedding band segment adjacent thereto associating the wedding band segment and setting contiguously and reinforcing each other, said band and ring having interengaging overlapping portions reinforcing each other, the interengaging overlapping portions comprising an annular groove on one ring portion and a flange on the other ring portion whereby the ring and band may be rotated in relation to each other.

2,408,983
COMPOSITION OF MATTER SUITABLE AS A HYDRAULIC FLUID
Myron H. Kollen, Detroit, Mich., assignor to Union Oil Company of California, Los Angeles, Calif., a corporation of California
No Drawing. Application January 25, 1943, Serial No. 473,543
21 Claims. (Cl. 252—73)



1. A composition of matter usable as a hydraulic fluid comprising a major proportion of high boiling isoparaffinic hydrocarbons boiling between about 400 and 700° F. blended with a relatively small amount sufficient to change the viscosity index thereof substantially, of a polymer of a low boiling olefin said polymer having a molecular weight above about 5000 and a polymerized acrylic acid ester of a saturated alcohol.

2,408,984
TOY PISTOL
William E. Lawson, Sr., Rahway, N. J.
Application May 10, 1944, Serial No. 534,936
4 Claims. (Cl. 124—17)

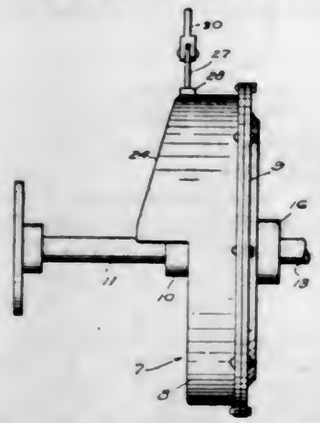


1. A toy pistol comprising a barrel and a handle, both the barrel and handle being hollow and rectangular in cross section and formed of folded sheet material, a trigger member rectangular in cross section and having a sliding fit in the hollow handle, and means on the upper end of the trigger member for releasably holding a projectile.

2,408,985
SHOCK ABSORBER
Bonnie L. Mallory, Cleveland Heights, Ohio, assignor to The B. L. Mallory Company, Hazel Park, Mich., a corporation of Michigan
Application December 29, 1944, Serial No. 570,253
8 Claims. (Cl. 188—130)

1. A shock absorber comprising a mounting, a brake drum non-rotatably supported thereby, a housing enclosing the drum and sustained for oscillation on the axis thereof, a brake band encircling the drum and having one of its ends fixed with respect to the housing, an energizing element frictionally engaging the inner surface of the drum, means connecting the energizing element to the end of the brake band opposite the one fixed with respect to the housing, the aforesaid mounting being adapted for attachment to one part of a vehicle, and means operatively connected to the housing for attachment to another part of the vehicle that is relatively movable with respect to the first mentioned part whereby when one part moves toward and from the other part the housing will be caused to oscillate with respect to the brake drum.

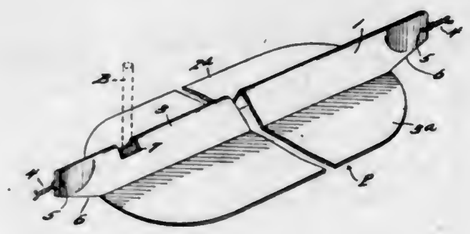
2,408,986
GEL BEAD
Milton M. Marisic, Woodbury, and Arthur C. Schmitt, Wenonah, N. J., assignors to Socony-Vacuum Oil Company, Incorporated, a corporation of New York
Application April 15, 1944, Serial No. 531,188
3 Claims. (Cl. 252—259.3)



3. A process for preparing spheroidal inorganic oxide gel particles of improved characteristics which comprises forming a hydrosol of inorganic oxide including silica and a metal oxide characterized by an inherent capacity to set to a hydrogel upon the lapse of a suitable period of time without addition to or subtraction from said sol of any substance, effecting dispersion in said sol of particles of a combustible solid of less than 300 mesh size, admitting said sol in the form of separate globules to a body of a liquid medium substantially immiscible with water in which said globules assume spheroidal shape due to surface tension at the interface between said sol and said liquid medium, retaining said spheroidal globules in said medium until gelation occurs, effecting retention in said sol of substantially all the constituents of said sol until gelation occurs, drying the spheroidal hydrogel and burning said combustible solid by contacting the dried gel with an oxidizing gas at combustion temperature.

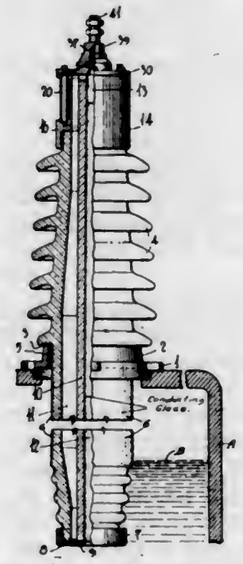
2,408,987
CATALYTIC PROCESS
Maryan P. Matuszak, Bartlesville, Okla., and Glen H. Morey, Terre Haute, Ind., assignors to Phillips Petroleum Company, a corporation of Delaware
No Drawing. Original application November 9, 1937, Serial No. 173,708. Divided and this application March 18, 1941, Serial No. 384,028
9 Claims. (Cl. 260—683.3)

4. A process for the treatment of a hydrocarbon material to effect a change in the carbon-hydrogen ratio thereof, which comprises contacting said hydrocarbon material at a reaction temperature within the range of 200 to 600° C. with a granular catalyst prepared by subjecting a granular non-powdery crystalline ammonium-containing salt of chromic acid, the particles of which are sufficiently large to be retained on a 40-mesh sieve, to controlled heating at an elevated temperature below the temperature at which said salt decomposes with incandescence, until the salt is substantially completely decomposed homogeneously throughout the individual granules while retaining its crystallic shape without disruption of the granules.



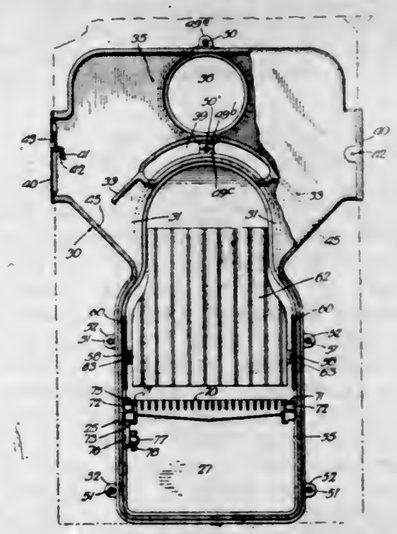
2,408,988
CENTRIFUGAL TYPE FLUID CLUTCH
Frank H. McElroy, Jersey Shore, Pa.
Application April 18, 1944, Serial No. 531,633
1 Claim. (Cl. 192—58)

A fluid motion transmitting clutch of the class described comprising a casing having central aligned bearings, a driving shaft mounted for rotation in one of said bearings and protruding into said casing, an impeller mounted on the protruding end and confined for rotation in said casing, a driven shaft mounted for rotation in the remaining bearing, a rotor keyed on said driven shaft and also confined in said casing, said rotor having marginally arranged lateral blades circumferentially spaced around the marginal portion of said impeller, said impeller having a central fluid entrance at its hub portion, said



casing being provided with inner and outer selectively usable ports, the outer port constituting an exhaust and the inner port an inlet, a side chamber on said casing housing said ports, said chamber constituting a fluid trap and return unit and being provided with an outer marginal valve guide, and a reciprocatory slide valve mounted in said guide and having a port therein, said valve serving to alternately open and close the intake and exhaust ports in proper timed relation in respect to the relative actions of the impeller and rotor.

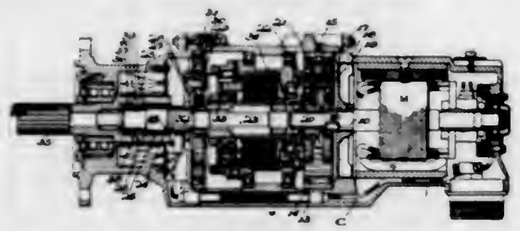
2,408,989
DOWEL BAR PROTECTOR
Robert A. McGrath, Sr., and Ellen E. McGrath, Brooklyn, N. Y.
Application April 11, 1945, Serial No. 587,726
2 Claims. (Cl. 25—118)



1. A protector for dowel bars comprising an elongated casing made of sheet material adapted to receive a dowel bar, the ends of said casing being closed, wings extending laterally from the lower ends of both sides of the casing but of less length than the casing, said casing being undercut adjacent its ends, and a relatively small opening in the top of the casing in the vicinity of one of its ends through which the dowel bar may be slid endwise into the casing.

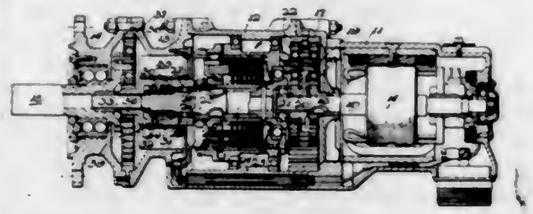
2,408,990
BUSHING INSULATOR
John E. M. Mitchell, Parkersburg, W. Va., assignor to Porcelain Products, Inc., Findlay, Ohio, a corporation of Delaware
Application July 16, 1941, Serial No. 402,671
3 Claims. (Cl. 174—31)

1. In electrical apparatus having a conducting housing containing insulating liquid and provided with an opening above the level of said liquid through which a high voltage conductor extends to a point below the level of said liquid, said conductor being supported by an insulator bushing mounted in said opening and extending below the level of said liquid, the combination of means for establishing a substantial voltage drop along the outer surface of said bushing between said opening and the level of said liquid, said means comprising a high-resistance path formed solely of a conducting glaze forming the exterior surface of said bushing and having electrical contact with said housing at said opening and extending to a point below the level of said liquid.



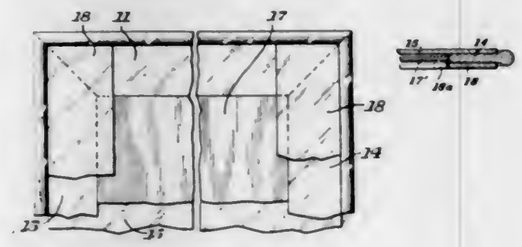
2,408,991
WARM AIR FURNACE
George E. Mumma, Winnetka, Ill., assignor to Sears, Roebuck and Co., Chicago, Ill., a corporation of New York
Application April 28, 1941, Serial No. 390,713
2 Claims. (Cl. 126—99)

1. In a heater apparatus, a plurality of similar component sections of which each comprises an integral casting designed for tandem assembly, each of said component sections including a lowermost portion having a horizontal bottom edge-wall and a pair of opposite side edge-walls, said bottom and side edge-walls profiling correspondingly and proportionally an ash pit chamber and a fire chamber and including a junction-defining edging for abutment with the corresponding edging of adjacent component sections, reverse curve portions merging into the upper extremity of said side edge-walls and extending inwardly to form a slight constriction thereat with edging flanges meeting centrally and defining an arch, relatively narrower side edge-wall portions merging with said reverse curve portions and flaring outwardly to extend beyond said opposite side edge-wall of said lowermost portion, thence extending vertically, and thereafter joining with a horizontal plane edge-wall portion to accordingly define the perimeter of a scutiform pouch, the vertical portions of said relatively narrower edge-wall having opposite cleanout openings for affording accessibility to the interior of said pouch, coextensive opposite walls joining with the several of said narrower pouch defining edge-wall portions to form an enclosure constituting said scutiform pouch, wall means defining an arched transverse communication opening through said coextensive walls and serving as a heat exchange passageway, said coextensive opposite walls hav-



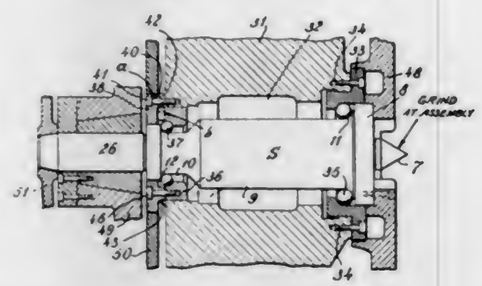
ing also a circular flue duct over said arched opening communicating with the interior of said scutiform pouch, and flue deflecting fins extending from said wall means and continuing the arched curvature of said opening within said pouch for the purpose of deflecting flue gases which rise from said fire chamber into heat exchanging lapping engagement with said flaring edge-wall portions.

2,408,992
LANDING GEAR ACTUATOR
Romeo M. Nardone, Teaneck, N. J., assignor to Bendix Aviation Corporation, Teterboro, N. J., a corporation of Delaware
Application January 28, 1944, Serial No. 520,121
6 Claims. (Cl. 192—.02)



1. In an actuator for an air-craft remotely-controlled element which is movable between limits, a motor having a drive shaft and a pair of field coils, each of which is adapted to be energized to drive the motor in one direction, an output shaft, a jaw clutch element carried by said output shaft in driving relation, another jaw clutch element drivably connected to said drive shaft by a planetary gear train, one of said jaw clutch elements being movable, solenoid means for causing movement of said movable jaw element into clutch engaging position, spring means for disengaging said clutch elements, a solenoid switch associated with each of said field coils for controlling the delivery of current thereto, contacts included in the circuit of each field coil and which contacts are adapted to be made or broken by movement of said movable jaw, a pair of limit switches for controlling the delivery of current to said solenoid means and said solenoid switches and a main control switch, each of said limit switches being adapted to simultaneously discontinue the delivery of current to said solenoid means and affect said solenoid switches to shut off the current to its respective field coil and at the same time deliver current to the other field coil for a brief interval to quickly stop said drive shaft.

2,408,993
ACTUATOR UNIT FOR RETRACTABLE LANDING GEARS
Romeo M. Nardone, Teaneck, N. J., assignor to Bendix Aviation Corporation, Teterboro, N. J., a corporation of Delaware
Application May 16, 1944, Serial No. 535,859
2 Claims. (Cl. 192—.01)

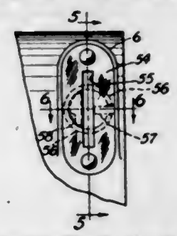


1. In an actuator unit for a retractable landing gear, a motor having a drive shaft, gear mechanism operatively connected to said drive shaft and constituting two stages of gear reduction, a main control clutch comprising two jaw clutch elements, a spring tending to separate said elements, and a solenoid adapted to be energized to bring said elements into meshing engagement, a friction clutch assembly operatively connecting one of said jaw clutch elements to said gear mechanism, gear mechanism operatively connected to the other of said jaw elements and constituting another stage of said gear reduction, and an output shaft drivably connected to the last said gear mechanism.

2,408,994
PICTURE FRAME OR THE LIKE
Alexis Nihon, Dorval, Quebec, Canada
Application August 6, 1943, Serial No. 497,603
8 Claims. (Cl. 40—152)

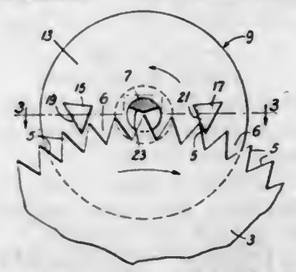
3. A display or supporting panel comprising strips of the bulb-edged margin which forms on the sides of drawn sheet glass, arranged in a polygon, and a sheet overlying the greater portion of said strips but not their bulb edges and secured thereto.

2,408,995
SPINDLE BEARING
Joseph J. Osplack, Detroit, Mich., assignor to Vinco Corporation, Detroit, Mich., a corporation of Michigan
Original application November 15, 1943, Serial No. 510,321. Divided and this application April 17, 1945, Serial No. 588,814
3 Claims. (Cl. 308—189)



1. In a device of the character described, in combination, an elongated spindle, a pair of spaced ball bearings on said spindle including oppositely disposed outer ball races, a support, means for fixing one of said outer races to said support and means for adjusting the other of said outer ball races relative to said fixed outer ball race comprising a plate, a set of protruding pads on said plate for engagement with said adjustable outer ball race and a second set of pads on said plate protruding therefrom in the same direction as said first set and spaced from the pads of said first set for engagement with said support.

2,408,996
CATALYST REJUVENATION
Robert L. Parker, Jr., South Pasadena, and Hal C. Huffman, Long Beach, Calif., assignors to Union Oil Company of California, Los Angeles, Calif., a corporation of California
No Drawing. Application June 9, 1943, Serial No. 490,226
6 Claims. (Cl. 196—52)

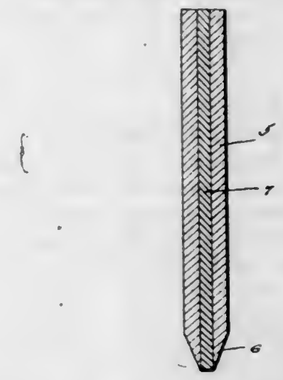


1. A process for changing the carbon-hydrogen ratio of hydrocarbon oils which comprises subjecting said hydrocarbons to an elevated temperature sufficient to cause the desired reaction in the presence of a catalyst for a reaction period in which the catalyst becomes coated with a carbonaceous deposit, subjecting the used catalyst to a regeneration treatment in which said carbonaceous deposit is removed at a temperature not more than about 100° C. higher than the reaction temperature, repeating the above cycle of operation until the catalyst becomes spent and its activity after regeneration is substantially lower than its original activity, rejuvenating the spent regenerated catalyst by heating it to a temperature between about 700° C. and 900° C. for a period between about one minute and about 10 hours and thereafter cooling the catalyst to said reaction temperature at a rate not in excess of about 5° C. per minute, and subjecting said hydrocarbons to said reaction in the presence of the thus rejuvenated catalyst.

2,408,997
TIMING DEVICE
Marcus H. Rhodes, Hartford, Conn., assignor to M. H. Rhodes, Inc., Hartford, Conn., a corporation of Delaware
Original application August 1, 1940, Serial No. 349,119. Divided and this application October 25, 1943, Serial No. 507,641
8 Claims. (Cl. 194—1)

1. In a coin-controlled device a coin receiver comprising a resilient split ring, the ring normally being smaller than the coin which it is to receive, the ring expanding upon insertion of a coin to receive the coin and contracting after the coin has passed through, and a projection on the receiver intersecting the split portion of the ring to prevent rotation thereof.

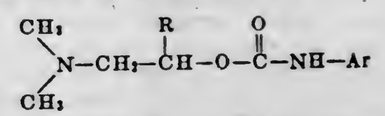
2,408,998
ESCAPEMENT
Marcus H. Rhodes, Hartford, Conn., assignor to M. H. Rhodes, Inc., Hartford, Conn., a corporation of Delaware
Application March 6, 1944, Serial No. 525,163
6 Claims. (Cl. 58—117)



1. In an escapement, a toothed escapement wheel, a balance wheel, an integral pallet means extending from said balance wheel and engageable with the teeth of the escapement wheel, said pallet means and balance wheel being composed of a non-metallic resilient material, the points of cooperation between the pallet means and the teeth of the escapement wheel being harder than the remainder of the integral parts.

2,408,999
MOTOR FUELS
Anthony E. Robertson, Roselle, N. J., assignor to Standard Oil Development Company, a corporation of Delaware
No Drawing. Application January 1, 1944, Serial No. 516,711
9 Claims. (Cl. 44—53)

1. A motor fuel comprising about 80 to 95% of a branched alkanol of 3 to 5 carbon atoms and a minor proportion sufficient to raise the Reid vapor pressure of the blend to at least 5 lbs. per square inch at 100° F. but not more than about 13 lbs. per square inch at 100° F. of a normally gaseous hydrocarbon of 3 to 5 carbon atoms selected from the group consisting of aliphatic and cyclo-aliphatic hydrocarbons.

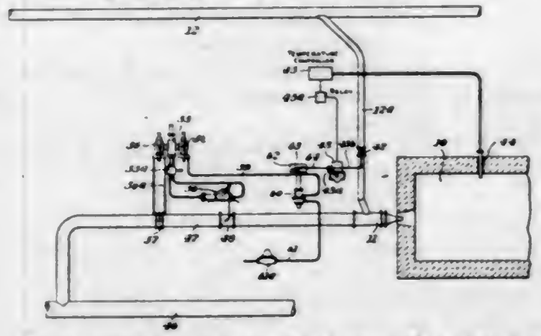


2,409,000
CRAYON
Albert Rubenstein, Washington, D. C.
Application April 27, 1945, Serial No. 590,565
1 Claim. (Cl. 120—83)

A writing crayon comprising a stick of colored wax having a tapered writing end and a stick of writing lead embedded in the stick of wax and extending from end to end thereof to form a reinforcing core therefor.

2,409,001
ESTERS OF DIMETHYLAMINOETHANOL USEFUL AS LOCAL ANESTHETICS
Robert S. Shelton, Mariemont, and Marcus G. Van Campen, Jr., Silverton, Ohio, assignors to The Wm. S. Merrell Company, Cincinnati, Ohio, a corporation of Delaware
No Drawing. Application May 21, 1943, Serial No. 487,968
2 Claims. (Cl. 260—472)

1. Compounds of the formula



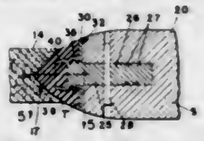
in which R is a radical from the group consisting of hydrogen and methyl and Ar is a phenyl radical.

2,409,002

METHOD AND APPARATUS FOR SUPPLYING PULVERIZED COAL AND AIR TO FURNACES

Edwin G. Smith, Mount Lebanon, Pa., assignor, by mesne assignments, to Union Industries, Incorporated, Grantsville, Md., a corporation of Maryland

Application June 12, 1943, Serial No. 490,588
5 Claims. (Cl. 110—104)



1. In a method of supplying pulverized solid fuel to a combustion chamber, the steps including circulating primary air through a delivery conduit, injecting the fuel into the air stream through the conduit, diverting a portion of the air and fuel from the conduit to the combustion chamber, varying the amount of fuel and air diverted in accordance with the temperature in said chamber, varying the amount of fuel and air supplied to the conduit in accordance with the air pressure therein, supplying secondary air to the chamber and controlling the amount of secondary air in proportion to the amount of primary air and fuel supplied.

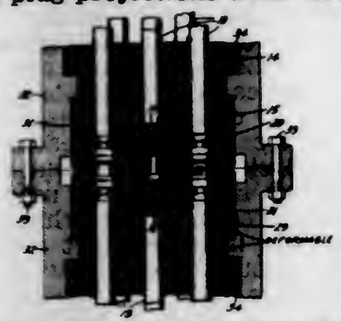
2,409,003

SHUTTLE WITH RUBBER TIP

Richard G. Turner, Worcester, Mass., assignor to Crompton & Knowles Loom Works, Worcester, Mass., a corporation of Massachusetts

Application November 3, 1945, Serial No. 626,461
5 Claims. (Cl. 139—196)

1. In a shuttle for a loom operating with a shuttle propelling picker, a metallic stud on the shuttle having a cavity therein facing the picker, and a tip of soft elastic material held on the stud and having a part thereof extending into said cavity.



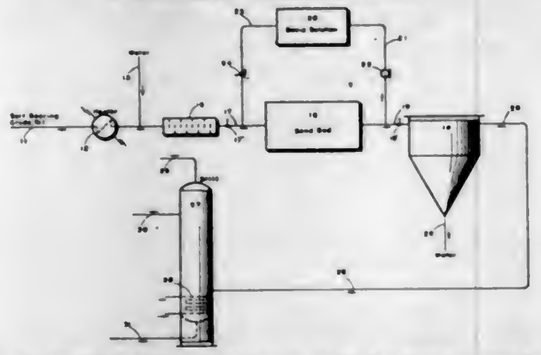
2,409,004

MULTICIRCUIT CONNECTOR

Alexander C. Wall, Indianapolis, Ind., assignor to General Electric Company, a corporation of New York

Application November 19, 1942, Serial No. 466,159
5 Claims. (Cl. 173—328)

1. A circuit connector including a terminal plug member of insulating material having a base portion and a plurality of projections, said projections being formed with a central passage therethrough which extends through said plug base portion, an electrical conductor extending through each of said passages in said plug base and projections, insulation about each of said conductors substantially filling said passages about said conductors in said plug base portion and projections, a connecting socket of insulating material having a plurality of apertures having contours complementary to the contours of said projections, said projections being adapted to fit snugly into said apertures providing substantially fluid-tight seals therewith, a connector in each of said socket apertures having a projecting element on each side thereof adapted to provide an electrical contact with said conductors in said plug projections when said plug pro-



jections are inserted in said socket apertures said socket having a double frusto-conical outer surface with the longer diameter of said conical surfaces intermediate the ends of said socket, and a sleeve of insulating material on each of said plugs with the inner frusto-conical surfaces complementary to said socket outer surface adapted to provide a snug fluid-tight fit therewith.

2,409,005

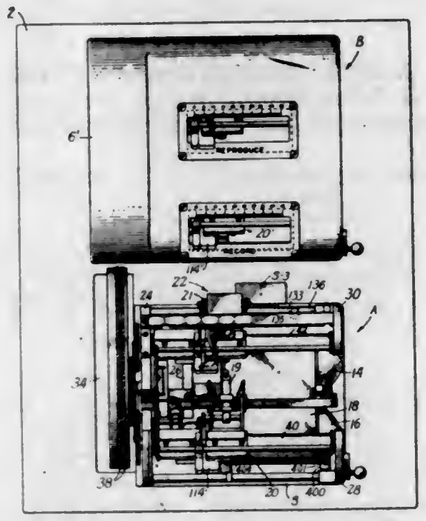
TREATING EMULSIONS

William O. Webber, Baytown, Tex., assignor to Standard Oil Development Company, a corporation of Delaware

Application May 27, 1944, Serial No. 537,651
5 Claims. (Cl. 252—322)

1. A method for treating salt-bearing crude oil comprising the steps of heating the oil, adding water to the heated oil and agitating in order to form an intimate admixture of the oil and water and to dissolve the salt from the oil into the water, contacting a bed comprising water-wettable, finely divided solids with a basic solution having a concentration within the range of .0125 to .25 per pound mole per 1,000 gallons of water in order to insure the thorough water-wetting of the bed, passing the mixture of oil and water through said treated bed and subsequently settling the mixture into a water component and into an oil component suitable for feeding to a distillation unit.

2,409,006



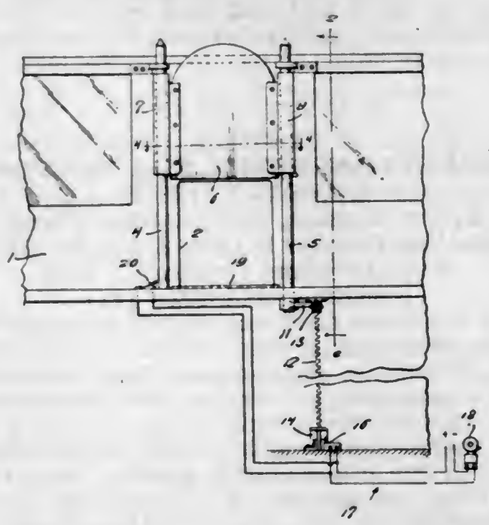
PHONOGRAPH

Simon Yerkovich, Fairfield, Conn., assignor to Dictaphone Corporation, New York, N. Y., a corporation of New York

Original application January 15, 1943, Serial No. 472,448. Divided and this application February 1, 1945, Serial No. 575,657
3 Claims. (Cl. 274—11)

1. In apparatus of the class described, wherein

duplicate normally successively operable sound recording machines, each comprising a record support and a recorder carriage, are each driven by a separate electric motor, in combination, independent switches for connecting a source of power with either or both of said machines motors, and mechanism operable by the respective carriages to operate said switches comprising two relatively movable cam bars adapted respectively to operate the respective switches and spring connected normally to act as a single bar,



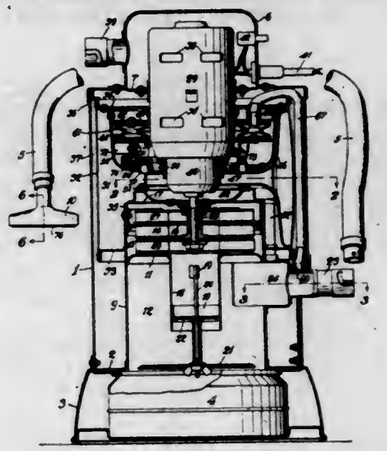
one being moved by the other, and separate shifting means to transmit carriage movement to the respective bars, said mechanism being operable by one of said carriages as it approaches the end of its record to start the motor of the other machine and being further operable by said one carriage to stop the motor of the first operated machine after further travel of said carriage, and said mechanism also being operable by the other of said carriages during travel first to start the motor of the first machine and then to stop the motor of the second machine.

2,409,007

BANK PROTECTOR

George W. Young, Bloomfield, N. J.

Application February 23, 1945, Serial No. 579,377
5 Claims. (Cl. 109—18)



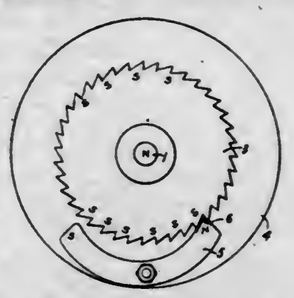
1. A bank protector of the character described comprising stationary and rotary guide posts, a shutter mounted for vertical sliding movement on the posts, coacting means on the rotary post and the shutter for releasably securing said shutter in raised position, and means for rotating said rotary guide post for releasing the shutter.

2,409,008

SUCTION CLEANER

Louis K. Acheson, North Canton, Ohio, assignor to The Hoover Company, North Canton, Ohio, a corporation of Ohio

Application April 26, 1943, Serial No. 484,511
15 Claims. (Cl. 15—16)

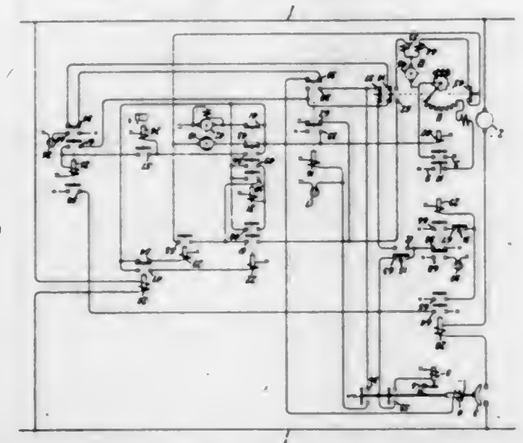


1. A suction cleaner having an inlet port for dirt-laden air, a main cleaning nozzle connected thereto and adapted to vary the air flow through and the air pressures in the cleaner by its contact with a surface being cleaned, a preliminary separator connected to said inlet port, suction-creating means connected to said preliminary separator to draw air therethrough, a final dirt separator connected to said suction-creating means to receive air exhausted therefrom, a driving motor for said suction-creating means, movable dirt-removing means to remove foreign material from said final separator, air-conducting means to connect said dirt-removing means to said preliminary separator, a pressure-variation-actuated air motor to drive said dirt-removing means, and air-conducting means to connect said air motor to a point of air pressure variation in said cleaner.

2,409,009

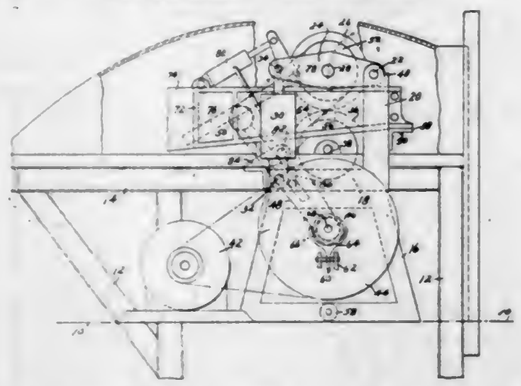
ONE-WAY DRIVE WITH MAGNETIC LOCK

Hans A. Bakke, Swampscott, Mass., assignor to General Electric Company, a corporation of New York



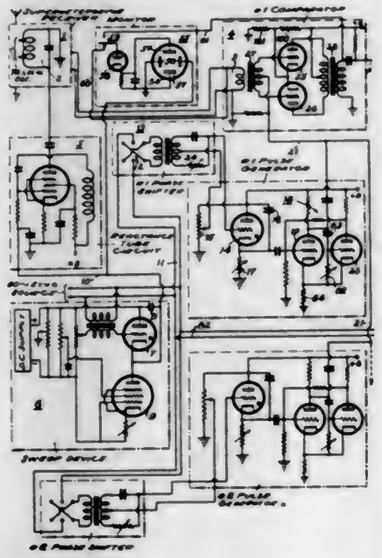
Application July 24, 1945, Serial No. 606,828
9 Claims. (Cl. 192—46)

1. A one-way drive comprising a wheel member made of magnetic material, and a lever pivotally mounted adjacent said wheel member, said lever having a locking part adapted to make contact with said wheel member when the lever is in one position to lock said member against ro-



tation in one direction relative to said lever, said lever being rotatable on its pivot away from such locking position, said lever including a permanent magnet cooperating magnetically with said wheel to bias said lever toward its locking position.

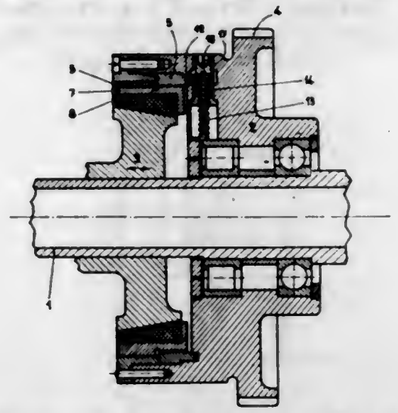
2,409,010
AUTOMATIC CONTROL EQUIPMENT
Herman Bany, Lansdowne, Pa., assignor to General Electric Company, a corporation of New York
Application March 27, 1943, Serial No. 480,776
10 Claims. (Cl. 171—119)



1. In combination, a source of current having a field winding, an adjustable field rheostat controlling the excitation of said field winding to control the voltage of said source, a control device, means responsive to said control device being in a predetermined position while said rheostat is in a position to effect a predetermined minimum source voltage for effecting the operation of said rheostat so as to effect an increase in said source voltage at a predetermined rate, means responsive to said source voltage being raised to a predetermined value by said first mentioned means for thereafter controlling said rheostat to maintain said source voltage at said predetermined value, timing means responsive to said source voltage reaching said predetermined value, and signalling means controlled by said timing means after it has been in operation for a predetermined time.

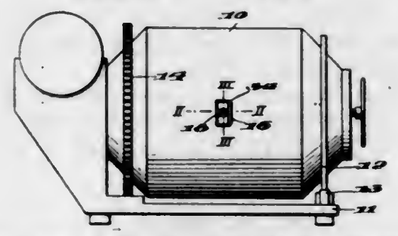
2,409,011
FULLING MILL
Harold H. Belcher, Orange, Mass., assignor to Rodney Hunt Machine Company, Orange, Mass., a corporation of Massachusetts
Application October 14, 1943, Serial No. 506,280
15 Claims. (Cl. 26—19)

1. A fulling mill comprising a frame, a roll operatively fixed in the frame. a second roll movably mounted on the frame, a pneumatic device for moving the second roll selectively to or from the first named roll, a packing box, a clapper therefor, a pneumatic device for adjusting the clapper, a drive for the rolls, a clutch for said drive, pneumatic means for operating the clutch, and a valve for said pneumatic means and devices effective to actuate the clutch operating device just prior to the other pneumatic devices whereby the rolls will start to rotate with little or no pressure on packing box or rolls when the mill is started.



2,409,012
RADIO RECEIVING SYSTEM
Warren H. Bliss, Orono, Maine, assignor to Radio Corporation of America, a corporation of Delaware
Application September 24, 1942, Serial No. 459,504
11 Claims. (Cl. 250—20)

1. In a telegraph receiving system, a first receiver, means for periodically tuning the receiver over a selected band of frequencies, a local pulse generator, means for combining the pulses from said generator with the output of said receiver, whereby signals from a known station appearing in the output of said receiver may be blanked out, a second receiver, a recorder in circuit with said second receiver, and means responsive to new signals in the output of said first receiver for causing said second receiver to tune to the frequency of the new signals.



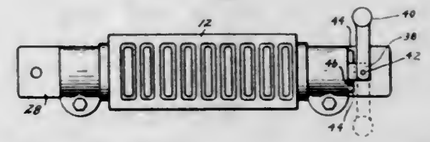
2,409,013
REGULATING DEVICE FOR FRICTION-CONE CLUTCHES
Ernest Bodmer, Geneva, Switzerland
Application October 9, 1944, Serial No. 557,817
In Switzerland October 27, 1943
3 Claims. (Cl. 192—111)

1. A friction cone clutch, including, clutch members movable axially toward and from each other, a friction cone socket-carrying annular support mounted for relative axial movement on one of said members, and means carried by said latter member for moving said support toward and from the other clutch member, said means comprising an annular adjusting ring movably interengaged at one end with the support and a spring-projected radially disposed locking member both mounted in the clutch member having the annular support, said locking member having means which, when the said locking member is in projected position locks together the ring and the clutch member in which it is mounted, and which means, when the locking

member is manually pushed inwardly to retracted position, engages the ring to impart lateral movement thereto as the locking member is rotated by manual manipulation.

2,409,014
MIX-CONSISTENCY INDICATOR FOR CONCRETE MIXERS
Clarence I. Bohmer and Arnold S. Millikin, Columbus, Ohio, assignors to The Jaeger Machine Company, Columbus, Ohio, a corporation of Ohio
Application May 25, 1944, Serial No. 537,333
9 Claims. (Cl. 73—54)

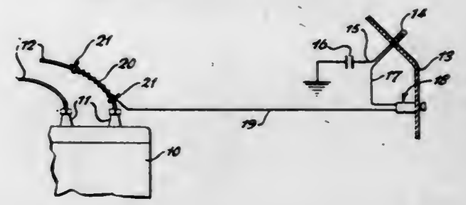
1. A consistency indicator for concrete mixers having a mix-receiving drum, said indicator comprising an open-sided housing provided in the wall and extending into the interior of said drum, a shaft turnable in bearings provided in the walls of said housing, the ends of said shaft projecting into said drum, mix-engaging paddle means disposed in and fixed to the ends of said shaft, said paddle means being arranged in the paths of mix travel within said drum, yieldable means resisting turning movement of said shaft from a normal position, and an indicator element fixed to turn with said shaft, said indicator element being positioned in said housing and having its outer end disposed for movement relative to a graduated surface provided on the exterior of said drum.



2,409,015
METHOD OF MAKING ALKOXY ACETALS
Carl Bordenca, Chicago, and Clifford J. B. Thor, Western Springs, Ill., assignors to The Visking Corporation, Chicago, Ill., a corporation of Virginia
No Drawing. Application October 6, 1944, Serial No. 557,549
9 Claims. (Cl. 260—615)

1. In the process of preparing alkoxy acetals by the reaction of an alkali metal alkoxide with diethyl acetal of chloracetaldehyde, the improvement which comprises carrying out the reaction in the presence of an inorganic iodide.

2,409,016
SHOCK-RESISTANT SILICON STEEL HARDENED WITH TITANIUM
Linwood M. Brown, Homestead, Pa.
No Drawing. Application October 19, 1942, Serial No. 462,508
6 Claims. (Cl. 75—123)

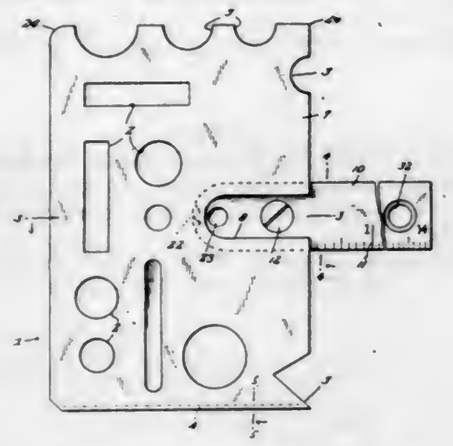


1. A shock-enduring steel alloy of high hardenability having substantially the composition: carbon, 0.40–1.00%; manganese, 0.35–2.50%; silicon, 0.80–2.75%; molybdenum, 0.15–2.90%; titanium, 0.10–0.90%; the silicon being in excess of the titanium, and the remainder substantially iron.

2,409,017
MAGNETIC SWIVEL WORK HOLDER
George J. Carson, Worcester, Mass., assignor to O. S. Walker Company, Inc., a corporation of Massachusetts
Application June 10, 1944, Serial No. 539,666
16 Claims. (Cl. 175—367)

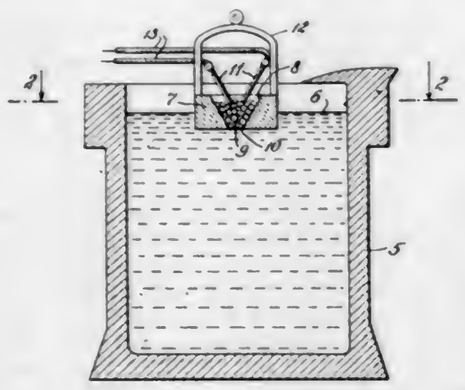
1. A device of the class described comprising a support, aligned journals therein, a permanent magnet holding device having a boss at each end mounted in the journals for rotation about an axis on the support, means to turn the holding device on and off, said means being rotatable bodily as the holding device is rotated, and a handle to operate said means for its intended purpose independently of the rotative position of the holding device.

2,409,018
WARNING SIGNAL
Warner R. Corey, Inkster, Mich.
Application August 14, 1945, Serial No. 610,837
2 Claims. (Cl. 177—311)



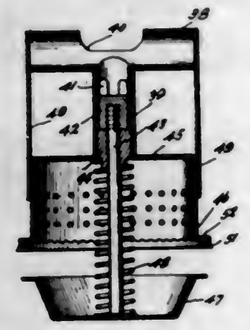
1. The combination with a vehicle having driving or navigation lights, an instrument board and an electric ignition system for its engine, of a glow discharge lamp mounted in the vicinity of the instrument board, means associated with the ignition system and connected to the glow discharge lamp to energize the latter when the engine is in operation, and means to interrupt the flow of energy through the lamp when the driving or navigation lights of the vehicle are turned on.

2,409,019
TEMPLATE
Marion S. Cree, Washington, Pa.
Application June 21, 1944, Serial No. 541,380
1 Claim. (Cl. 33—100)



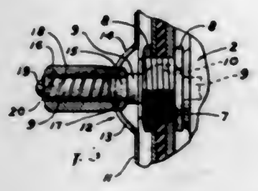
A combination tool comprising a head having a recess opening into one side edge and an adja-

cent face, said head also having an internally screw threaded opening communicating with the recess, said recess extending perpendicular to the side edge of the head, a blade adapted to be received in the recess and to project from the head perpendicular to the side edge of the head containing the recess, said blade having a countersunk opening adapted to align with the screw threaded opening, a protractor scale on the face



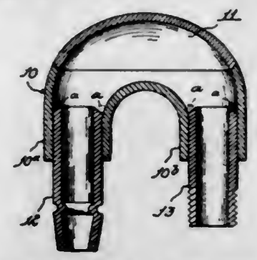
of the head opposite that containing the recess, a pointer on the blade adapted to cooperate with the protractor scale when the blade is on the unrecessed side of the head and a screw adapted to enter the countersunk opening in the blade and to engage the threaded opening in the head to hold the blade in the recess or in cooperative relation with the protractor scale according to the side of the head to which the blade is attached.

2,409,020
METHOD FOR DESULPHURIZING IRON WITH MOLTEN CALCIUM CARBIDE
John J. Crowe, Westfield, N. J., assignor to Air Reduction Company, Incorporated, New York, N. Y., a corporation of New York
Application December 8, 1943, Serial No. 513,384
3 Claims. (Cl. 75—58)



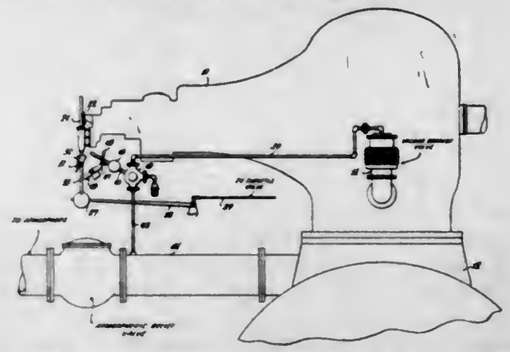
1. In the desulphurizing of molten iron and steel, the steps which comprise confining commercially pure calcium carbide to a relatively small restricted area on the surface of a body of the molten metal, melting the calcium carbide by means of an electric arc, thereby introducing the molten calcium carbide into the body of molten metal beneath the surface thereof while the molten metal is in a state of agitation to cause desulphurization of the metal.

2,409,021
PIE DOUGH FORMER, TRIMMER, AND CRIMPER
Loring J. Dale, Phoenix, Ariz.
Application July 28, 1943, Serial No. 496,468
7 Claims. (Cl. 107—49)



3. In a structure of the class described, a cup-like member having a trimmer and crimper, a dough former, a rod carrying said former and surrounded by a spring, a handle structure on said cup-like member, and a guide and detachable nut connection between the rod and handle structure, whereby to permit the former to be detached when the crimper is brought into play.

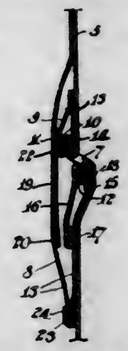
2,409,022
SAFETY SWITCH
John H. Diedring, Anderson, Ind., assignor to General Motors Corporation, Detroit, Mich., a corporation of Delaware
Application November 18, 1944, Serial No. 564,157
2 Claims. (Cl. 200—172)



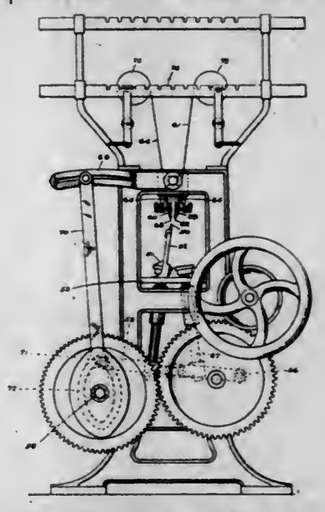
1. In a switch, an operating stem pivotally mounted for angular movement between a pair of spaced operative positions closing separate circuits and an intermediate inoperative position, a plate having a slot through which said stem passes, a knob slidably mounted on said stem at said slot and adapted to move axially of the stem to uncover the stem in the slot, a spring acting on said knob to normally hold it in a position covering said stem in the slot, said slot having a wide portion of sufficient width to receive said knob and a narrow portion of sufficient width to receive the exposed part of said stem but of insufficient width to receive said knob, the wide portion of said slot extending over the inoperative position of said stem and one of its operative positions, and the narrow portion of said slot extending over the other of the operative positions of said stem so that unobstructed movement of said stem is permitted between its inoperative position and one of said operative positions and movement to the other of said operative positions is possible only when said knob is moved axially on said stem against the action of said spring to uncover said stem in the slot and permit entrance of said stem into the narrow portion of the slot.

2,409,023
METHOD OF MAKING RETURN BEND PIPE COUPLINGS
Charles A. Dies, Chicago, Ill.
Application May 10, 1943, Serial No. 486,352
1 Claim. (Cl. 29—157.6.)

The method of making a return bend pipe coupling for radiators and coils for steam boilers which consists in cutting away a small portion at one side of a short length of pipe to provide an arcuate opening, bending the pipe at the center of the opening to form the side members and connecting portion of the return bend with the aforementioned arcuate opening in the upper part of the connecting portion, and attaching short lengths of pipe—with pipe connecting means at their outer ends—to the outer ends of the side members by inserting the short lengths of pipe into the outer ends of the side members and welding them thereto at their inner ends through the aforementioned opening in the connecting portion of the return bend, and finally welding a cap over said opening.



2,409,024
STEAM TURBINE CONTROL MECHANISM
Frederick L. Dornbrook, Milwaukee, Wis., assignor to Wisconsin Electric Power Company, Milwaukee, Wis., a corporation of Wisconsin
Application November 15, 1944, Serial No. 563,584
7 Claims. (Cl. 60—95)

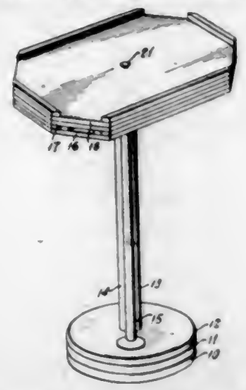


2. In a steam turbine having a rotor, a condenser, and a vacuum breaker valve for said condenser, the combination of an overspeed governor for said turbine, fluid pressure operated means to open said breaker valve through the vacuum of the condenser to reduce the speed of the turbine and to close said valve on the release of vacuum, a control valve for said valve operating means, and means controlled by said overspeed governor for moving said control valve to breaker valve opening position.

2,409,025
POCKET CONSTRUCTION FOR TROUSERS
Irving M. Falk, Philadelphia, Pa., assignor to The Nu Pocket Method Co., Philadelphia, Pa.
Application December 18, 1944, Serial No. 568,715
2 Claims. (Cl. 2—248)

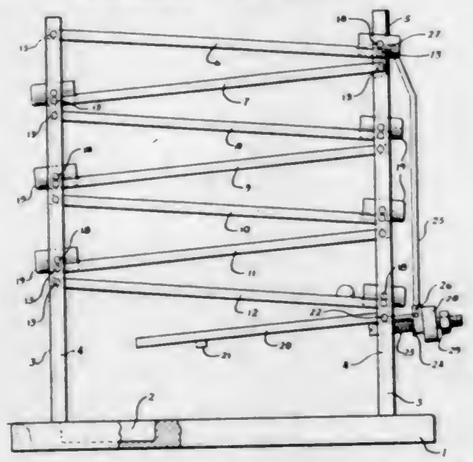
1. The method of making a garment pocket which comprises placing a double length of pocket material on a garment, slitting both the pocket material and garment and folding said pocket material upwardly upon itself, stitching the upturned portion of the pocket material to the garment above the slit, and stitching a strip of tape over the side edges of the pocket material to close the pocket.

2,409,026
KNITTING MACHINE AND METHOD
Louis N. Feinstein, Brooklyn, N. Y., assignor to Sam Feinstein, Rebecca Feinstein, and Louis Feinstein, doing business as Feinstein Knitting Mills, Inc., New York, N. Y.
Application February 3, 1945, Serial No. 575,954
3 Claims. (Cl. 66—86)



1. A warp knitting machine to produce a knitted fabric of diamond shaped pattern, said machine comprising two guide bars having uniformly spaced guides, a needle bar having uniformly spaced needles, each guide of said guide bars being adapted to have a yarn threaded therethrough, a pattern drum having two series of links thereon, the first series of links comprising the following pattern: 0, 2, 0, 2, 4, 2, 4, 2 to control the first guide bar, and the second series of links comprising the following pattern: 0, 2, 0, 0, 4, 2, 4, 4 to control the second guide bar.

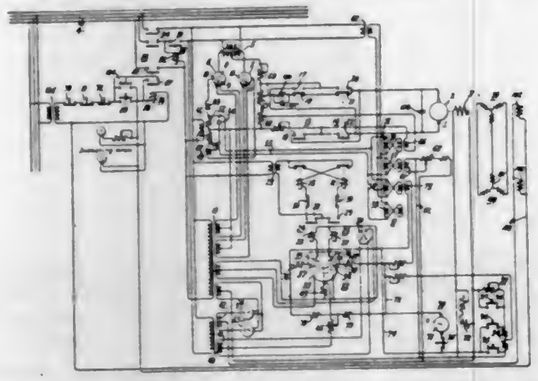
2,409,027
NESTED SERVING TABLE
Alan R. Fergusson, Larchmont, N. Y.
Application March 8, 1944, Serial No. 525,805
5 Claims. (Cl. 311—1)



1. In a serving table combination, a plurality of interengaged units, each unit consisting of a base, a standard and a tray, the trays and bases of all units being nested with one another, while their standards are in parallel relation to each other, in that the bases of the upper units are adapted to facilitate the passage therethrough of the standards of the lower units, means for at-

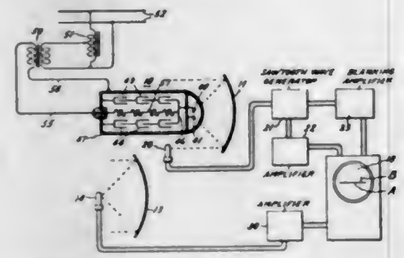
taching the trays individually to their intended standards, when the units are separated, said means serving as supports for the nested trays,

and other means for connecting all standards with each other and for securing the trays of all units in their nested position to the connected standards.



2,409,028
MECHANICAL TOY
Everett V. Filbrun, Dayton, Ohio
Application May 11, 1945, Serial No. 593,133
2 Claims. (Cl. 46—43)

1. A mechanical toy, a pair of standards, a plurality of sets of oppositely inclined tracks attached to and supported by the standards, one of said tracks pivotally mounted on one of the standards, pivoted pocket members mounted on the standards adapted to receive marbles from one set of tracks and discharge them on another set of tracks, one of said pocket members being connected to and tilted by the pivotally mounted track.

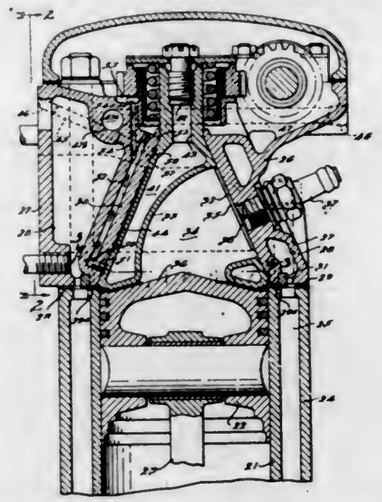


2,409,029
ELECTRIC VALVE MOTOR CONTROL SYSTEM
Lyman R. Fink, Schenectady, N. Y., assignor to General Electric Company, a corporation of New York
Application June 14, 1940, Serial No. 340,494
9 Claims. (Cl. 172—179)

1. In combination, an alternating current circuit, a dynamo-electric machine having an armature winding and a field winding, electric translating apparatus energized from said circuit and including electric valve means, reversing switching means connected between said electric valve means and one of the windings of said machine for controlling the polarity of the voltage impressed thereacross, said switching means having an actuating means, control means for said electric valve means to control the magnitude of the voltage supplied to said one winding, means for energizing said actuating means selectively to control the polarity of the voltage impressed

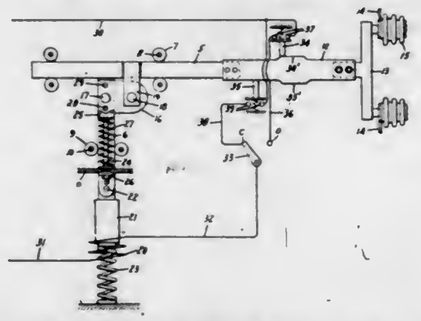
across said one winding and including an electric discharge device having a control grid, means for impressing a control voltage on said grid to control the polarity of the voltage impressed across said one winding and means responsive to said control voltage for controlling the output voltage of said electric valve means.

2,409,030
LIGHT-IMPULSE SYSTEM
Victor H. Fraenckel and Siegfried Hansen, Schenectady, N. Y., assignors to General Electric Company, a corporation of New York
Application December 22, 1941, Serial No. 423,984
10 Claims. (Cl. 315—59)



1. In a system in which light impulses are transmitted to a distant object and thereafter corresponding reflected impulses are received from said object in a time dependent upon the distance to the object, the combination which comprises a charge-storing agency, means for periodically charging the said agency, a spark-discharge type of light source, and circuit connections between the charge-storing agency and the light source for allowing the intermittent discharge of the former through the latter, said charge-storing agency and said circuit-connections being of such small inductance that the duration of each of the resultant light impulses is a fraction of the time required for reflection of such impulses from the aforesaid distant object.

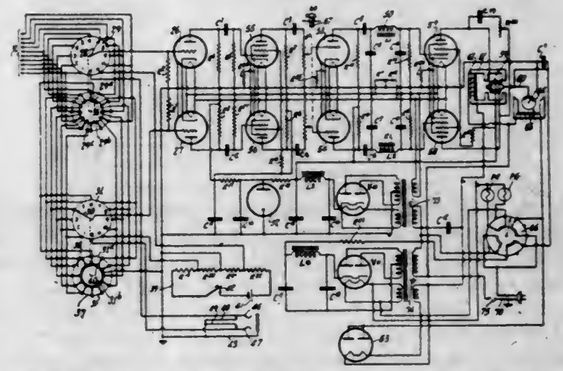
2,409,031
ENGINE
Clarence E. Frank, Fraser, Mich., assignor to Briggs Manufacturing Company, Detroit, Mich., a corporation of Michigan
Application March 20, 1944, Serial No. 527,222
20 Claims. (Cl. 123—80)



1. In an internal combustion engine having a cylinder, a cylinder head, a rotatable valve in said

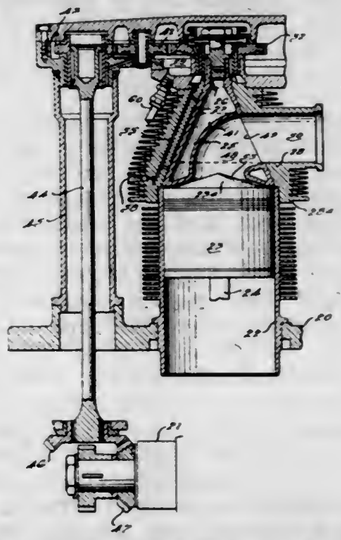
head associated with the cylinder, an oil inlet conduit in said cylinder head communicating with a bearing surface of the valve for delivering oil

thereto, and a porous plug element in said conduit contacting said valve and restricting the flow of oil to said bearing surface, and constructed to permit flow of the oil through the pores thereof.



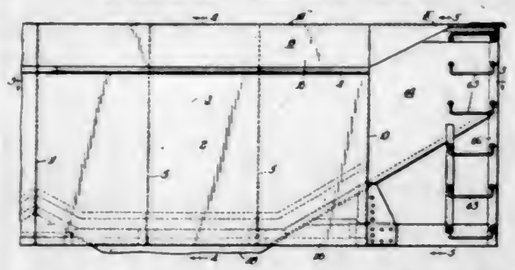
2,409,032
OPERATING MECHANISM
Charles E. Freese, Scotia, N. Y., assignor to General Electric Company, a corporation of New York
Application October 13, 1943, Serial No. 506,053
13 Claims. (Cl. 200—87)

6. An operating mechanism for electric switches comprising a contact operator and an actuator therefor respectively mounted for reciprocating rectilinear movement of predetermend extents in directions substantially perpendicular to each other, electromagnetically actuated means for effecting substantially one-half of the movement of said contact operator in one direction of its movement upon a complete forward movement of the actuator and substantially the other half of the movement of said contact operator in said one direction of its movement upon a complete reverse movement of the actuator, and means controlled by said contact operator for effectively deenergizing said electromagnetically actuated means at an intermediate point of the movement of said contact operator.



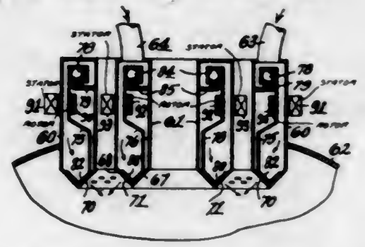
2,409,033
ELECTROENCEPHALOGRAPH DEVICE
Lovett Garceau, Holliston, Mass.
Application November 4, 1941, Serial No. 417,865
12 Claims. (Cl. 128—2.1)

1. In a device for making recordings of potentials generated in the human brain, a multistage push-pull amplifier, a plurality of contact members, means to hold said contact members in predetermined or definite positions in contact with the scalp of a patient, switching means, conductors for connecting said contact members to said switching means, connections between said switching means and the control grids of the first stage of said amplifier, said switching means being adapted to selectively connect said grids to any two of said conductors and to ground all of the other conductors,



shielding means surrounding said conductors and connected to ground potential, a metallic table or the like for supporting said patient, a thin insulating pad between said table and said patient, means for connecting said support to ground potential thereby reducing the impedance of said tissue and leading off interfering potentials to ground, and a recording device connected to the output of said amplifier for recording potentials picked up by said contact members from said patient after the same have been amplified.

2,409,034
ENGINE
Waldo G. Gernandt and Alfred E. Walden, Detroit, Mich., assignors to Briggs Manufacturing Company, Detroit, Mich., a corporation of Michigan
Application July 19, 1943, Serial No. 495,260
23 Claims. (Cl. 123—80)



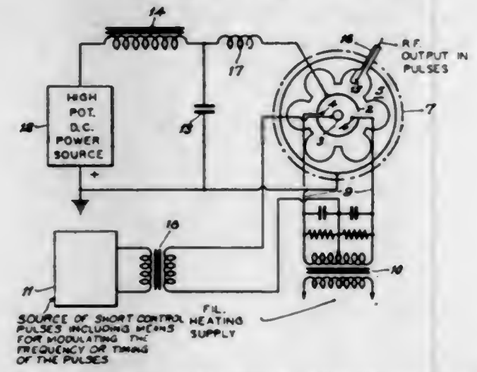
1. In an internal combustion engine, a cylinder head, and a rotatable generally frusto-conical valve therein, the outer wall of said valve and the juxtaposed wall of the cylinder head being relatively relieved to provide a circumferential area of varying clearance between the juxtaposed walls of the cylinder head and valve, said relieved area having a carbon formation therein providing a bearing surface between the valve and cylinder head.

2,409,035
RAILWAY CAR STRUCTURE
Garth G. Gilpin, Chicago, Ill., assignor to Standard Railway Equipment Manufacturing Company, Chicago, Ill., a corporation of Delaware
Application October 27, 1943, Serial No. 508,083
6 Claims. (Cl. 105—409)

1. A wall for a railway car comprising spaced apart stakes each comprising a single web extending transversely of said car and chamfered at its upper outer edge, a wall sheet bent along its upper portion to the plane of said chamfers and welded to the outer edges of said stakes including the chamfered portions thereof, and a top chord comprising an inverted L-shaped section welded at both edges thereof to the bent portion of said wall sheet in overlapping relation with said stakes.

2,409,036
FEEDING DEVICE FOR COMBUSTION CHAMBERS
Robert H. Goddard, Roswell, N. Mex., assignor of one-half to The Daniel and Florence Guggenheim Foundation, New York, N. Y., a corporation of New York
Application October 12, 1942, Serial No. 461,670
5 Claims. (Cl. 158—36)

2. Feeding mechanism for a combustion chamber in a rocket motor comprising concentric fixed annular casings mounted on said combustion chamber and projecting therein and having slots in their lower end portions, means to feed fluid fuel and a fluid oxidizing agent to said concentric fixed casings, rotatable annular members mounted within said fixed casings and having slots in their lower end portions coacting with said first-named slots to provide fluid passages when aligned therewith, and means to rotate said annular members.

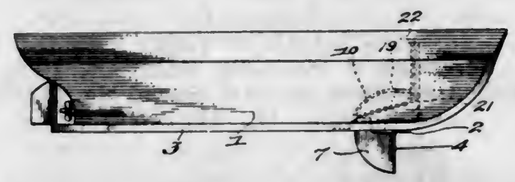


2,409,037
DOOR CONSTRUCTION
Frederick A. Guth, Denver, Ohio
Application September 4, 1944, Serial No. 552,590
10 Claims. (Cl. 160—33)

1. Door construction comprising a plurality of relatively slidable rigid door sections effective when in extended positions to close an associated doorway and to occupy relatively overlapping positions of marginal registration when positioned to open said doorway, means for supporting and moving said door sections between positions of doorway opening and closure, each pair of said door sections being formed with registering channels, and a rigid bar member movably occupying said channels and confined for longitudinal move-

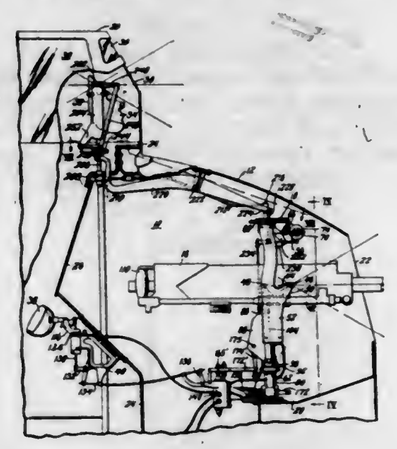
ment therein, said bar members serving to unite the door sections associated therewith for guided relative movement.

2,409,038
MAGNETRON AND CIRCUIT THEREFOR
Clarence W. Hansell, Port Jefferson, N. Y., assignor to Radio Corporation of America, a corporation of Delaware
Application December 31, 1942, Serial No. 470,768
28 Claims. (Cl. 250—36)



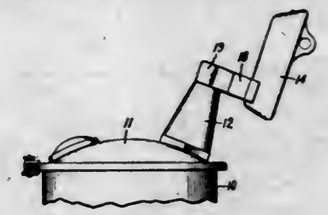
23. An electron discharge device comprising a metallic anode structure having a plurality of similar inwardly projecting electron target portions surrounding a substantially cylindrically-shaped hollow cathode, said anode and cathode being coaxially arranged, the spacing between the outside diameter of said cathode and the internally projecting target portions being less than the diameter of said cathode.

2,409,039
HALOGENATED COMPOUNDS AND PROCESS FOR MAKING SAME
Edgar E. Hardy, Anniston, Ala., and Gennady M. Kosolapoff, Dayton, Ohio, assignors to Monsanto Chemical Company, a corporation of Delaware
No Drawing. Application January 28, 1944, Serial No. 520,100
14 Claims. (Cl. 260—461)



1. The process for manufacturing dialkyl phosphate derivatives which comprises reacting an aliphatic alcohol with phosphorus trichloride to form a crude product containing a dialkyl hydrogen phosphite and then chlorinating said product to produce the corresponding dialkyl chlorophosphate.

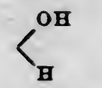
2,409,040
COMBINED SEA ANCHOR AND STABILIZER FOR BOATS
Asa J. Harris, Balboa, C. Z.
Application March 21, 1945, Serial No. 583,987
3 Claims. (Cl. 114—126)



1. The combination with the hull of a boat having a keel, of a horizontal stabilizing fin fixed to the bottom of said keel and extending crosswise of the same, and a sea anchor comprising a drag plate hinged to said horizontal fin for swinging upwardly and rearwardly into horizontal position and downwardly into pendent substantially vertical position, and a vertical stabilizing fin extending from one side of said drag plate at a right angle thereto to trail said drag plate when said plate is swung downwardly, the vertical stabilizing fin extending upwardly through said keel for vertical swinging from a down swung position into an ineffective position and to swing the drag plate into horizontal position, and means in said hull to swing said vertical stabilizing fin upwardly.

2,409,041
GUN MOUNTING MECHANISM
Fred V. Hart, Lynn, and Lambert S. Linderoth, Jr., Marblehead, Mass., assignors, by mesne assignments, to the United States of America, as represented by the Secretary of War
Application May 12, 1942, Serial No. 442,688
5 Claims. (Cl. 89—41)

1. In a power operated mount for a gun, a pair of normally-vertical side plates embracing said gun and interconnected above and below said gun to form a frame, means pivoting said gun on and between said plates for elevation about a first normally-horizontal axis fixed relatively thereto, means mounting said frame for pivotal movement about a second normally-vertical axis and including a shaft aligned with said second axis and fixed to said frame, a traveler guided for translation only on and along said shaft, motor means connected to so translate said traveler, and link means pivoted at one end of said gun on an axis parallel to and offset with respect to said first axis, and to said traveler at the other end, whereby operation of said power means pivots said gun in elevation.

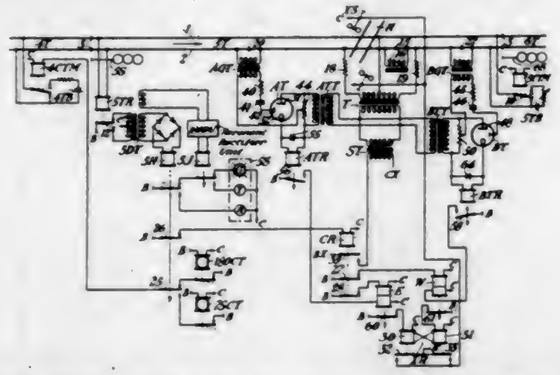


2,409,042
INSULATING GUARD
Benjamin R. Hermann, Lanesborough, Mass., assignor to General Electric Company, a corporation of New York
Application December 5, 1942, Serial No. 467,974
5 Claims. (Cl. 174—138)

1. In combination with an electrical device, an insulator including an electrical terminal at one end thereof, a circuit interrupting device, a supporting arm for said circuit interrupting device mounted on said terminal and electrically interconnecting said circuit interrupting device and said terminal, a resilient member mounted on said arm, a guard of insulating material enclosing the exposed parts of said terminal and arm for preventing foreign objects from adversely affecting said circuit interrupting device, and means including said resilient member engaging said guard to hold said guard in position on said arm.

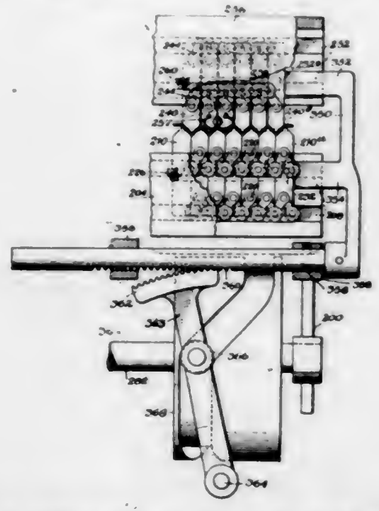
2,409,043
HYDROXYLATED CYCLOPENTANO POLYHYDROPHENANTHRENE COMPOUNDS AND METHOD OF MAKING THE SAME
Hans Herloff Inhoffen, Berlin-Wilmersdorf, Germany, assignor to Schering Corporation, Bloomfield, N. J., a corporation of New Jersey
No Drawing. Application January 19, 1940, Serial No. 314,687. In Germany January 13, 1939
9 Claims. (Cl. 260—397.4)

1. In a process for the production of compounds of the cyclopentano polyhydrophenanthrene series, the step which comprises reacting a member of the group consisting of nuclearly saturated and nuclearly unsaturated 3-R-20-keto compounds of the pregnane series wherein R is a member of the class consisting of



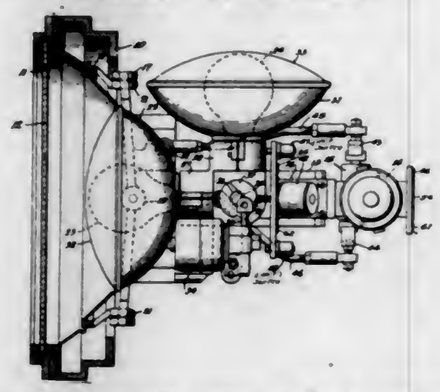
and groups convertible into the latter group with the aid of hydrolysis, there being a methyl group occupying the 21-position, with a halogen to convert said methyl group into —CH_2Hal, Hal standing for halogen.

2,409,044
RAILWAY SIGNALING APPARATUS
Arthur L. Jerome, Edgewood, Pa., assignor to The Union Switch & Signal Company, Swissvale, Pa., a corporation of Pennsylvania
Application January 9, 1943, Serial No. 471,838
17 Claims. (Cl. 246—130)



1. In apparatus for controlling the signal at the intersection between a highway and a stretch of railway track having track rails divided by insulated joints into track sections each of which is provided with track circuit apparatus comprising a relay governed by energy supplied over the section rails, said track stretch including an approach zone which is traversed by a train approaching said intersection and at least one end of which is situated at a point in said stretch

which is not a point of division between said track sections, in combination, a crossing signal, a first and a second transformer located at opposite ends of said approach zone and connected together in series over the rails of the portion of said stretch forming said approach zone, the relay of the track circuit for the track section which includes the highway intersection being

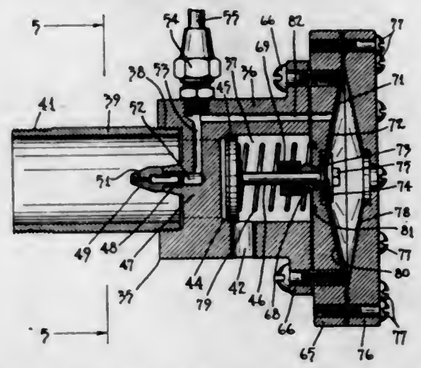


effective when picked up to prevent operation of said crossing signal and when released to cause to be supplied to said first transformer energy which is incapable of operating said track relay, and means responsive to energy supplied from said first transformer through said second transformer for also preventing operation of said crossing signal.

2,409,045
SLIP STITCHING MACHINE
Carl W. Johnson, Brooklyn, and Joseph A. Neumair, Hollis, N. Y., assignors to American Machine & Foundry Company, a corporation of New Jersey
Application February 17, 1943, Serial No. 476,164
5 Claims. (Cl. 112—174)

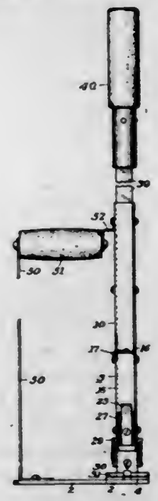
1. In a machine for making neckties, a row of spaced elements upon which a lining may be positioned with its length extending transversely thereof, and a folded necktie fabric having its longitudinal edges lapped upon each other may be positioned with its lapped edges extending along a longitudinal axis of said lining, a series of spaced members adapted to be engaged with the portions of said positioned necktie parts extending between said elements, springs connected to said elements and members and thereby maintaining them in spaced relation, means for moving said members to engage said members with and thereby flex the portions of said necktie parts intermediate said elements, and mechanism for moving said elements and members transversely toward each other to decrease the spacing thereof and thereby pleat the lining and fabric for stitching of the same together by a needle.

2,409,046
SIGNAL DEVICE
Jeremiah D. Kennelly, Oak Park, Ill.
Application June 22, 1944, Serial No. 541,561
6 Claims. (Cl. 177—329)



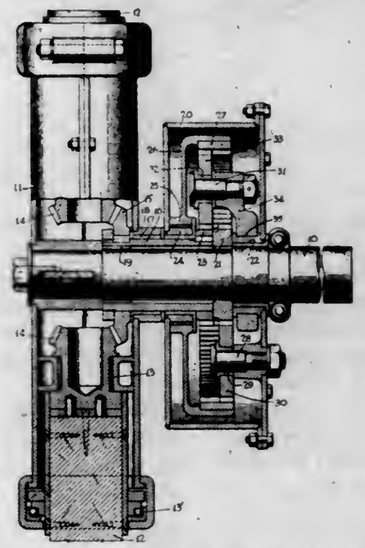
1. A signal device comprising a main frame adapted to be fixedly mounted on a car or the like and formed with an opening through which a light beam may project, a subframe, universal mounting means connecting the subframe to the main frame for universal pivotal movement relative thereto, a support pivoted on the subframe, a pair of light sources carried by the support to be moved selectively into register with the opening, means to oscillate the subframe about the universal mounting means, and means on the subframe to move the support to bring one or the other of the light sources into register with the opening.

2,409,047
PAPERBOARD COIN BOX
Clarence F. Klein, Columbus, Ohio, assignor to Frankenberg Bros., Inc., Columbus, Ohio, a corporation of Ohio
Application June 20, 1945, Serial No. 600,460
3 Claims. (Cl. 229—8.5)



3. A normally closed coin-receiving box comprising a paperboard body composed of a single blank of material which is cut and folded to provide side, front and back panels and a plurality of reenforcing panels engageable with the inner surfaces of the front and back panels and with at least one of the side panels, a plurality of end-forming flaps formed with certain of said panels, the flaps at one end of said box embodying a pair of overlapping slotted flaps constituting integral extensions of said front and back panels, each of said slotted flaps possessing an area corresponding substantially to the full horizontal cross sectional area of the assembled box body, additional coin-retaining flaps integrally formed with the inner reenforcing front and back panels, each of said coin-retaining flaps possessing an area substantially less than that of the slotted flaps, so that the adjoining edges of the coin-retaining flaps are disposed substantially in alignment with the slots of the first-named flaps, and narrow inturned flap extensions formed with said side panels and arranged between the resiliently movable coin-retaining flaps and the slotted upper flaps for adhesive union with the lower of the slotted flaps.

2,409,048
WATER CLOSET
Frank J. La Mere, Minneapolis, Minn.
Application April 10, 1944, Serial No. 530,315
7 Claims. (Cl. 4—215)

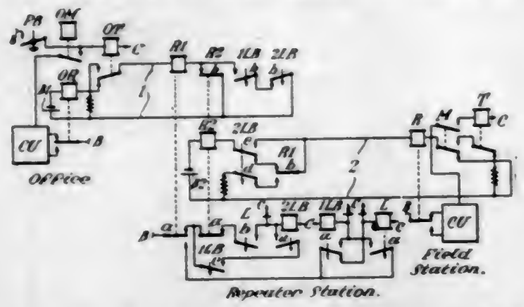


1. In combination with the bowl, stack and water supply pipe of a water closet, means forming a gas passageway between said bowl and stack, a valve in said passageway, an injector connected to said water pipe for procuring a draft through said passageway, means including an expansible fluid chamber connected to said water pipe for operating said valve and means for causing the simultaneous opening of said valve and operation of said injector.

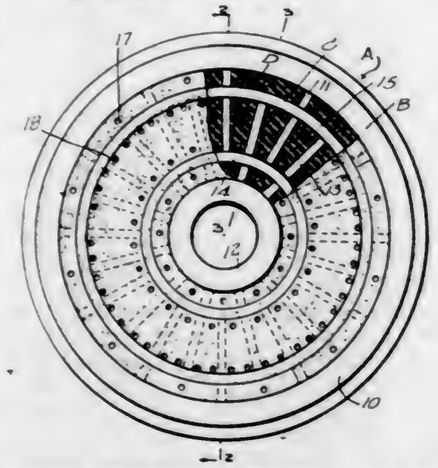
2,409,049
DRIVER FOR TILT-TOP STAPLES
Joseph C. Lang, Pittsburgh, Pa., assignor to Bocji Corporation, Pittsburgh, Pa., a corporation of Delaware
Application August 2, 1943, Serial No. 497,002
7 Claims. (Cl. 1—49)

1. A staple driving machine for use on roofs and like locations comprising a base plate of relatively large area, a driver mechanism and magazine mounted on the base plate, the base plate extending to one side of the driver and magazine sufficiently to provide a surface on which the operator of the machine may place his foot for holding the machine in place, the magazine being mounted directly on the base plate, and being provided with a feed mechanism for advancing a row of staples horizontally.

2,409,050
PROPELLER DRIVE WITH PITCH-CHANGING MECHANISM
Joseph Ledwinka, Philadelphia, Pa.
Application March 17, 1944, Serial No. 526,985
2 Claims. (Cl. 74—395)



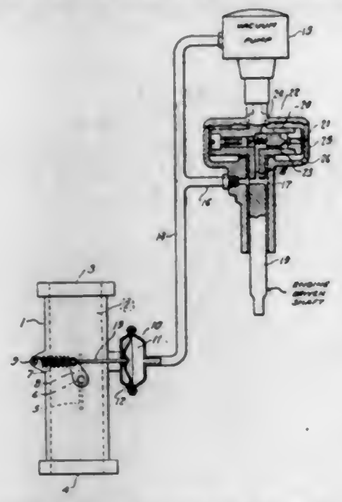
1. In a device of the class described, a pair of shafts rotatable about a common axis, one driving and one driven, and continuously intermeshed gearing forming a driving connection between said shafts, said gearing comprising an external gear fast to said driving shaft and a similar gear fast to said driven shaft and disposed in side by side relation to said first-named gear, an internal gear having a peripheral toothed portion encircling said external gears and spanning in width the combined width of their peripheries and further having a mounting portion disposed axially at one side only of said external gears for supporting it through a plain radial bearing for rotation about the common axis of said shafts, and a single pair of external gears rotatably mounted on respective normally fixed axes disposed on substantially diametrically opposite sides of said common shaft axis, the gears of said pair having their planes of rotation offset from each other in the direction of the common shaft axis, one meshing with the gear fast to said driving shaft and the other meshing with the gear fast to said driven shaft and both meshing with said internal gear and together forming the sole driving connection between said driving and driven shafts and said internal gear, the axis of one of said pair of external gears being mounted for angular adjustment about the common shaft axis to advance or retard the speed of one shaft with respect to the speed of the other.



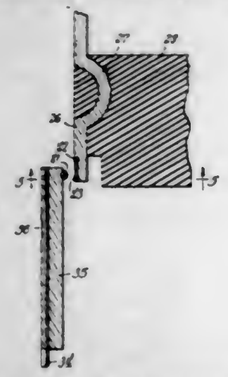
2,409,051
REMOTE CONTROL SYSTEM
Lloyd V. Lewis, Pittsburgh, Pa., assignor to The Union Switch & Signal Company, Swissvale, Pa., a corporation of Pennsylvania
Application September 2, 1944, Serial No. 552,504
12 Claims. (Cl. 177—353)

8. In a remote control system, a repeater including two line relays, a code transmitter at a control office for supplying code impulses to a first

communication circuit extending to said repeater for controlling one of said line relays, a code transmitter at a distant station for supplying code impulses to a second communication circuit extending to said repeater for controlling the other line relay, means including contacts of said one line relay for repeating code impulses received from the office into said second circuit, means controlled by the other line relay in response to the first impulse of a code received from said station for locally generating an impulse of relatively brief duration and for supplying such impulse to said first circuit, and means effective only if no impulse is received from the office during the reception by said repeater of the first impulse of a code received from said station for rendering the line relay for said second circuit effective to repeat the succeeding impulses of such code into said first circuit.



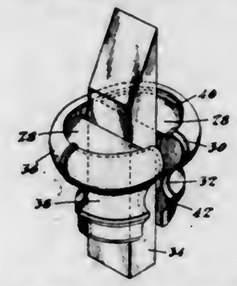
2,409,052
WHEEL
James Matthew MacLean, Detroit, Mich.
Application July 20, 1944, Serial No. 545,811
6 Claims. (Cl. 295—11)



2. A wheel comprising two main structural elements in the form of a rim and a hub operatively arranged in concentric relation to one another, load supporting means in connection with each of said elements and a filling material having resilient characteristics disposed in the annular space between said elements and in contact with said load supporting means providing a resilient but stable wheel core and forming the means of continuity between the rim and the hub, said core being orificed adjacent to said load supporting means.

2,409,053
ENGINE GOVERNOR
Marion Mallory, Detroit, Mich.
Application June 11, 1945, Serial No. 598,818
6 Claims. (Cl. 123—103)

2. A governor for an internal combustion engine having an intake passageway comprising a throttle valve in said passageway, a pressure responsive device connected to said throttle valve, vacuum producing means in communication with said pressure responsive device and adapted to be driven by the engine so that the vacuum produced by said means will vary substantially in accordance with the speed of the engine, an air bleed to atmosphere for controlling the effective pressure at said pressure responsive device, and a centrifugally controlled valve for said air bleed responding at the governed speed of the engine and tending to close said air bleed whereby the pressure responsive device responds to the vacuum created by said means and tends to move said throttle valve toward closed position to decrease the charge entering the engine.



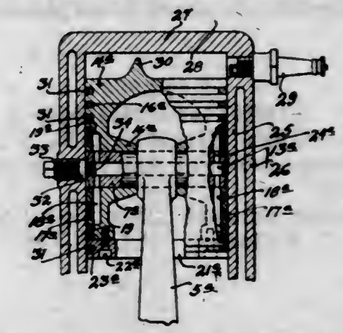
2,409,054
RELAY CONSTRUCTION
Frank R. McBerty, Mansfield, Ohio, assignor to The North Electric Manufacturing Company, Galion, Ohio, a corporation of Ohio
Original application July 29, 1940, Serial No. 348,222. Divided and this application June 28, 1943, Serial No. 492,568
8 Claims. (Cl. 200—104)

6. Multiple contact arrangement comprising a stationary contact element, a flat narrow metallic strip fixedly supported in insulated relation, a contact plate of erosion resisting metal clad upon the face of the lower end thereof, a groove formed in said contact plate to provide ridges on opposite sides of the groove, a cooperating movable contact element cooperating with said stationary contact element, said movable contact element comprising a narrow rigid metallic armature aligned longitudinally with said strip and having its inner end overlapping said contact plate, a slender spring wire reed upon the outer end of which said armature is rigidly attached in longitudinal alignment, and a short piece of fine contact wire of an erosion resisting metal welded upon and across the upper overlapping end of the armature and lying transverse to the aforesaid ridges on the stationary contact, said wire reed being adapted to be flexed longitudinally to bring said contact wire into engagement with said contact plate and adapted to be twisted if necessary to secure engagement of said contact wire with both ridges when the movable contact element is urged toward the stationary contact element.

2,409,055
METHOD OF MAKING HELMET EAR MUFFS
John J. McCann, Lowell, Mass.
Application February 10, 1944, Serial No. 521,767
11 Claims. (Cl. 2—209)

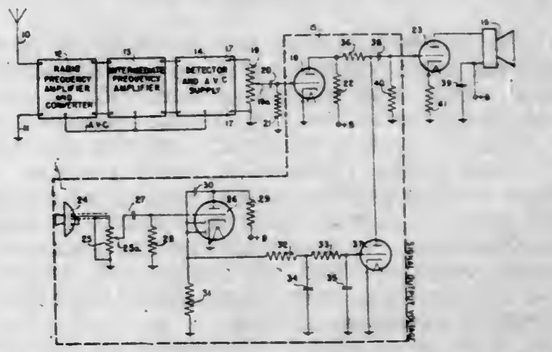
3. A method of making an annular shell, comprising the steps of placing an annulus of soft fabric over an expansible form having a substantially annular and convex outwardly curved peripheral portion and an adjacent substantially annular and concave inwardly curved peripheral portion of relatively smaller diameter, expanding the form to bring said portions into tight shaping contact with the annulus, removing the shaped annulus from the form, turning the larger portion outside-in to a position forming the outer wall of a hollow ring of which the relatively smaller shaped portion is the inner wall, and securing the free edges of the inner and outer walls together.

2,409,056
SOAP COMPOSITION
Herbert Kenneth McClain, Wyoming, Ohio, assignor to The Procter and Gamble Company, Ivorydale, Ohio, a corporation of Ohio
No Drawing. Application August 22, 1944, Serial No. 550,671
8 Claims. (Cl. 252—368)



1. The process of inhibiting the development of rancidity and discoloration in a granular soap product prepared from a fat formula containing a minor proportion of rosin, which comprises incorporating with the soap a polyethylene polyamine of the formula

$$H_2N \cdot C_2H_4 \cdot (HN \cdot C_2H_4)_x \cdot NH_2$$



wherein x is a whole number from 1 to 3.

2,409,057
PISTON
Arthur E. Meinke, Minneapolis, Minn.
Application May 24, 1943, Serial No. 488,113
13 Claims. (Cl. 309—6)

8. In an engine, a cylinder, a piston working in said cylinder and having a head and a skirt, the skirt being formed by spaced inner and outer walls providing a lubricant reservoir therebetween, the outer cylinder-engaging portion of said walls being formed of a porous oil-absorbing metal, cooperating oil passages leading from the lubricating reservoir of the piston, aligned wrist pin-receiving apertures extending diametrically of the piston and through opposite sides of the inner and outer walls of the skirt, a wrist pin seated in the several aligned apertures, an oil passage through the cylinder wall at a point traversed by one of the wrist pin-receiving apertures in the outer wall of the piston skirt, and a cooperating oil passage from that end of the wrist pin to the piston's lubricant reservoir, a removable plug for closing the oil passageway in the wrist pin, and a removable plug for closing the oil passageway in the wrist pin, and a removable plug for closing the oil passage in the cylinder.

2,409,058
CONTROL SYSTEM FOR WAVE-SIGNAL RECEIVERS
Donald H. Mitchell, Chicago, Ill., assignor to Galvin Manufacturing Corporation, Chicago, Ill., a corporation of Illinois
Application December 18, 1944, Serial No. 568,635
5 Claims. (Cl. 250—20)

1. In a modulated-wave-signal receiver adapted to be installed in an automobile and to operate under ambient noise levels of a wide range of values encountered while the automobile is in motion and including a sound-reproducer, a control system comprising, a signal-translating stage, a microphone displaced from said sound-reproducer and responsive to ambient noise in the vicinity of said receiver for developing a control signal, and means for utilizing said control signal to vary the signal output of said stage directly in accordance with said ambient noise.

2,409,059
PROCESS FOR REFINING MINERAL OILS
James V. Montgomery, Brownwood, Tex., L. Barrett Goodson, New York, N. Y., and Robert W. Henry, Bartlesville, Okla., assignors to Phillips Petroleum Company, a corporation of Delaware
No Drawing. Original application August 23, 1940, Serial No. 353,956. Divided and this application June 9, 1944, Serial No. 539,590
2 Claims. (Cl. 196—13)

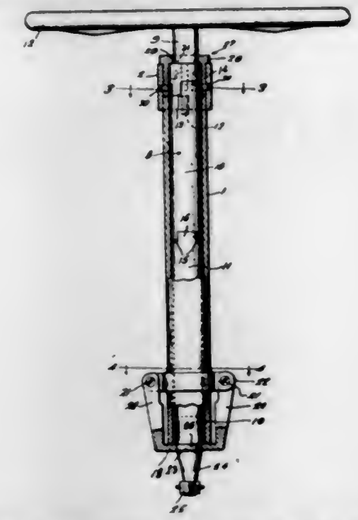
1. The process of solvent extraction of mineral oils including the steps of mixing the oil with a solvent mixture comprising a hydrogenated selected fraction of commercial pyridine, an anti-solvent, and water, the selected fraction of com-

mercial pyridine boiling between the approximate limits of 240° and 500° F., and the hydrogenated material consisting essentially of pipecolines and the antisolvent being acetone, thereby forming a raffinate phase and an extract phase, and separating the raffinate phase from the extract phase.

2,409,060
LIGHTWEIGHT MAST
Harold A. Moore, Riverhead, N. Y., assignor to Radio Corporation of America, a corporation of Delaware
Application June 11, 1943, Serial No. 490,441
4 Claims. (Cl. 20—99)

1. A lightweight mast composed of one or more sections, each comprising three parallel arranged wood rails substantially symmetrically related each to the other, corresponding recesses spaced along the length of said rails on each side thereof, bent rungs retained in said recesses, said rungs serving as steps and as means for retaining said rails as a unit, said rails being of reduced dimensions at each end and having enlarged recessed portions than the other end thereof so that the sections may be partially telescoped to extend the mast as desired.

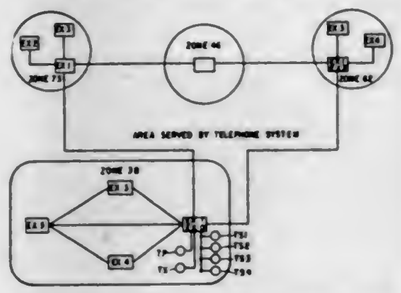
2,409,061
BETA-AMINO, BETA-PROPYL GLUTARONITRILES AND PROCESS OF PREPARING THEM
Richard O. Norris, Chicago, Ill., assignor to Sinclair Refining Company, New York, N. Y., a corporation of Maine
No Drawing. Application August 1, 1945, Serial No. 608,361
5 Claims. (Cl. 260—464)



1. Compounds of the formula

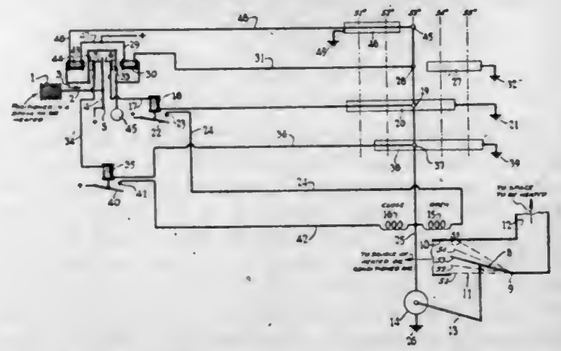
$$N{\equiv}C{-}CH_2{-}\underset{\displaystyle R}{\overset{\displaystyle NH_2}{\underset{|}{\overset{|}{C}}}}{-}CH_2{-}CN$$

in which R is a radical of the group consisting of the propyl and isopropyl radicals.



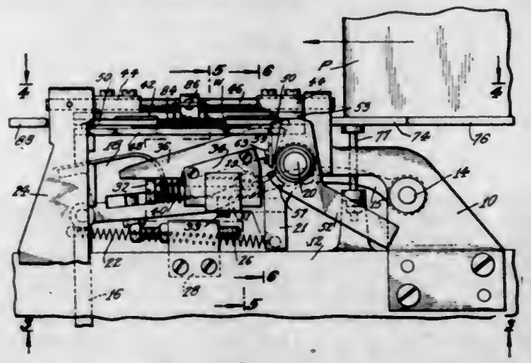
2,409,062
STEERING COLUMN
Charles C. Oliver, New Orleans, La., assignor of one-half to Avin C. Johnson, New Orleans, La.
Application March 10, 1945, Serial No. 582,086
5 Claims. (Cl. 64—3)

1. A steering column of the character described comprising a tubular housing, a removable shaft rotatably mounted in said housing, said shaft including a shoulder on one end portion, a sleeve fixed on the corresponding end portion of the housing and projecting therefrom, said sleeve having an internal circumferential groove and further having a longitudinal groove therein communicating with the first-named groove, a stop projecting into the first-named groove, a



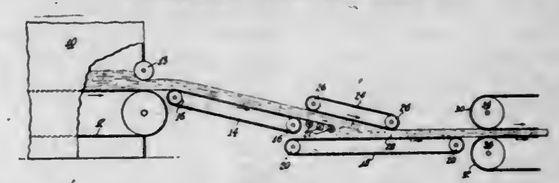
cap member mounted on the shaft and engaged with the shoulder, a lug on said cap member engageable in the first-named groove for anchoring said cap member in the sleeve, said lug being engageable with the stop, and a latch on the sleeve engageable with the lug for releasably securing the nut against retrograde rotation in said sleeve.

2,409,063
TELEPHONE SYSTEM
John E. Ostline, Chicago, Ill., assignor to Automatic Electric Laboratories, Inc., a corporation of Delaware
Application September 18, 1941, Serial No. 411,350
19 Claims. (Cl. 179—18)



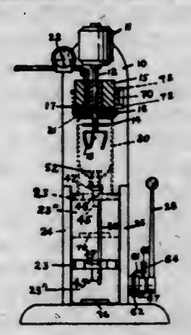
1. In a telephone system, a calling line, a called line, switching apparatus operative to set up a connection from said calling line to said called line, primary register mechanism, secondary register mechanism, means included in said primary register mechanism for registering therein digits transmitted over said calling line, additional means included in said primary register mechanism for determining in accordance with one or more of the digits registered therein whether said secondary register mechanism must be utilized to control said switching apparatus, further means included in said primary register mechanism and governed by said determining means for sending the digits registered therein to said secondary register mechanism, and means included in said secondary register mechanism for registering therein the digits sent from said primary register mechanism and for controlling said switching apparatus in accordance with the digits registered therein, whereby said switching apparatus is operated to set up a connection from said calling line to said called line.

2,409,064
DAMPER CONTROL
Robert J. Parsons, Schenectady, N. Y., assignor to Consolidated Car Heating Company, Inc., Albany, N. Y., a corporation of New York
Application February 4, 1944, Serial No. 521,036
2 Claims. (Cl. 236—76)



2. In a damper control, in combination: two separated juxtaposed contact fingers, said fingers having an unoperated position and an operated position, means normally biasing the contact fingers to unoperated position; a pivoted conducting member positioned therebetween and adapted to pivot so as to touch either of the contact fingers; electro-magnetic members, one positioned adjacent each of the contact fingers and each including an armature bearing a contact finger; means including a device actuated by the temperature of a space to be air-conditioned for moving the conducting member into contact with either of the said contact fingers and means for energizing either one or the other of the electromagnetic members whereby either one or the other of the contact fingers may be separated from the pivoted conducting member.

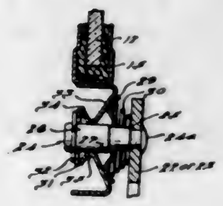
2,409,065
END LABELING MECHANISM
Ernest E. Pohl, Elmhurst, N. Y., assignor to American Machine & Foundry Company, a corporation of New Jersey
Application January 24, 1945, Serial No. 574,380
9 Claims. (Cl. 164—49)



3. In a web-cutting mechanism, the combination with a stationary support, of a stationary knife provided with a cutting edge, said stationary knife also being provided with members which are pivotally mounted on said stationary support, an arm pivotally mounted for swinging movement to and fro, a knife supporting member pivotally mounted on said arm, a movable knife secured to said member and having a cutting edge adapted to coact with the cutting edge of said stationary knife to sever a length of material from a web of material positioned between the cutting edges of said knives, said stationary knife being pivotally movable upon said stationary support to a position wherein its cutting edge overlies one corner of said movable knife, and a spring urging said movable knife toward the stationary knife to maintain the corner of the movable knife underlying the stationary knife against the cutting edge of the stationary knife, the remainder of the movable knife being spaced sufficiently from the stationary knife to permit a web of material to be inserted between the cutting edges of the knives, said arm being movable toward the stationary knife to move the cutting edge of the lower knife across the cutting edge of the upper knife and thereby sever a length of material from said web, and a device for moving said movable knife away from the stationary knife to permit the stationary knife to be removed by swinging said members outwardly on said stationary support.

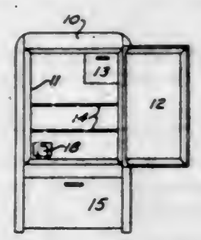
2,409,066
MANUFACTURE OF FELTED PRODUCTS
Edward R. Powell, North Plainfield, N. J., and Harry E. Holcomb, Stratford, Conn., assignors to Johns-Manville Corporation, New York, N. Y., a corporation of New York
Application January 23, 1943, Serial No. 473,368
7 Claims. (Cl. 154—28)

1. A method of reorienting the fibers of a traveling mat of felted mineral wool in which the fibers lie predominantly in planes parallel to the faces of the mat, said method comprising moving said mat to means traveling in a plane at an angle to the plane of such movement of said mat, but in the same general direction as, and at a slower speed than, such movement of said mat, and substantially simultaneously therewith confining the upper surface of said mat by means traveling in the plane of the upper surface of said mat and in the direction of movement of said mat.



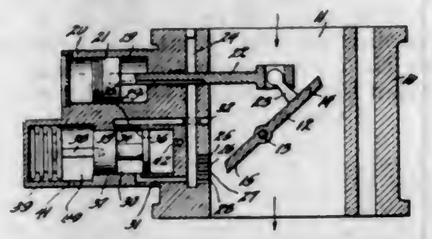
2,409,067
MEANS AND METHOD FOR MAKING PALATABLE MATERIAL
Claude A. Reed, Omaha, Nebr.
Application June 30, 1941, Serial No. 400,430
22 Claims. (Cl. 99—79)

1. The process of preparing a lacteal food comprising freezing a plurality of the ingredients



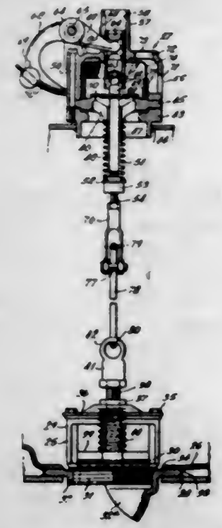
of said food into a solid mass, comminuting, mixing and impregnating ingredients of said food, including said solid mass, in a mixing zone with a gaseous material under superatmospheric pressure until a flowable mixture results, and releasing said flowable mixture to atmospheric pressure.

2,409,068
WINDOW REGULATOR
John H. Roethel, Detroit, Mich., assignor to Marvel Equipment Corporation, Detroit, Mich., a corporation of Michigan
Application February 11, 1942, Serial No. 430,327
11 Claims. (Cl. 287—93)



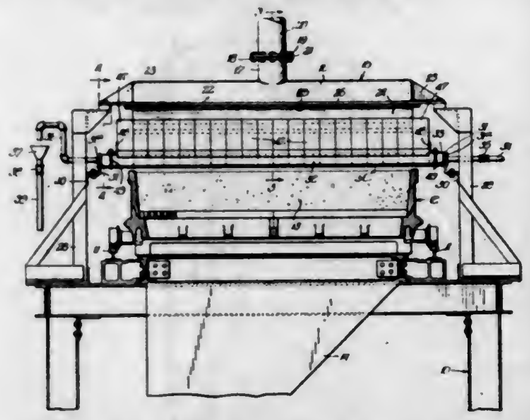
7. A window regulator comprising a swinging arm having a transverse stud fixed at its inner end adjacent one end of said arm, said stud having inner and outer annular abutments and a cylindrical portion therebetween, a yieldable washer located on the stud and slidable under spring pressure toward the outer end of the stud between the arm and the inner abutment and limited by said last abutment against outward movement on the stud, and means attachable to the stud and engaging the outer abutment for connecting the stud to a member.

2,409,069
REFRIGERATOR
Homer E. Rosebrook, Greenville, Mich., assignor, by mesne assignments, to Gibson Refrigerator Company, Greenville, Mich., a corporation of Michigan
Application June 12, 1941, Serial No. 397,680
7 Claims. (Cl. 62—89)



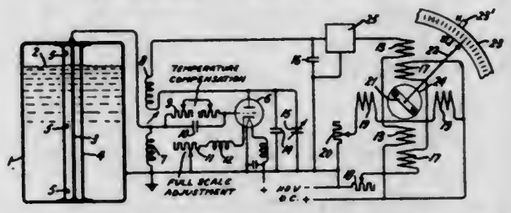
1. A refrigerator including, in combination, a cabinet formed to provide a main refrigerated compartment, a housing in said main compartment defining an auxiliary compartment, the walls of said housing being formed of relatively poor heat conducting material, means for refrigerating said main compartment including a condenser located outside of said main compartment, and heat transfer means for maintaining the temperature within said auxiliary compartment above that within the main compartment, said heat transfer means having a portion in heat exchange relation with said condenser and another portion in heat exchange relation with said auxiliary compartment, said last named portion being substantially insulated from said main refrigerated compartment.

2,409,070
SPEED GOVERNOR
Thomas M. Ruby, Whitmore Lake, Mich., assignor to King-Seeley Corporation, Ann Arbor, Mich., a corporation of Michigan
Application April 27, 1945, Serial No. 590,541
8 Claims. (Cl. 137—153)



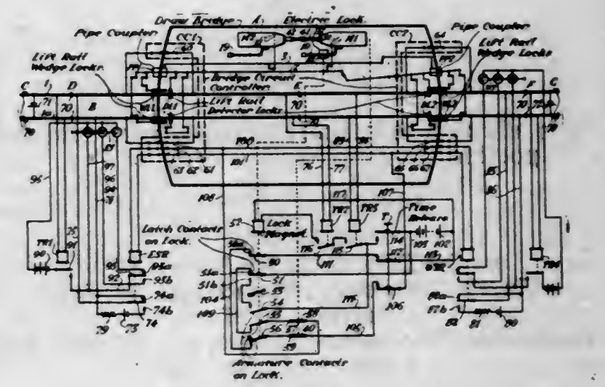
1. In a speed governor for internal combustion engines, a governor body enclosing a fuel-mixture conduit, an unbalanced throttle-plate supported in said conduit and adapted to be moved toward closed position by the flow of fuel mixture therethrough, means including a pressure-responsive element for urging said throttle-plate toward closed position, and means for progressively subjecting said pressure-responsive element to increasing degrees of engine vacuum as said throttle-plate approaches its closed position.

2,409,071
VENTING AND DISCHARGE VALVES FOR TANKS
Carlyle H. Scott, Forest Hills, and Paul H. Scott, Flushing, N. Y., assignors to The Safety Tank Truck Corporation, New York, N. Y., a corporation of New York
Application May 25, 1940, Serial No. 337,269
2 Claims. (Cl. 137—21)



1. In a vent and breather valve for tanks for storing liquids having volatile components, comprising a valve seat, a valve head, yieldable means for normally holding said valve head on said seat, the combination therewith comprising a cap overlying said valve seat, and means movably mounted on said cap for lifting said valve from said seat against the resistance of said spring by a lost motion linkage whereby the valve may move independently and auxiliary discharge means for said valve comprising vent openings in said cap, a second set of vent openings in said cap, and fusible and frangible means normally closing said openings but adapted to yield under conditions of excessive pressure or temperature.

2,409,072
IGNITION FURNACE
Edward W. Shallock, Chicago, Ill., assignor to American Ore Reclamation Company, Chicago, Ill., a corporation of New York
Application August 26, 1943, Serial No. 500,075
8 Claims. (Cl. 266—21)



1. In an ignition furnace for sintering machines, a fuel supply retort having a downwardly extending tip member, a supporting frame disposed below said retort provided with substantially horizontal tubular members disposed at opposite sides of said tip member, said tubular members being adapted for circulation therethrough of a cooling fluid, refractory members seating adjacent their lower ends on the upper portions of said tubular members and seating adjacent their upper ends against the opposite sides of said tip member defining a downwardly opening combustion chamber, said refractory members being free from each other and from said tubular members and said tip member for individual removal and replacement, said tip member opening into said chamber for supplying fuel thereto, and refractory members mounted on said tubular members closing the ends of said chamber.

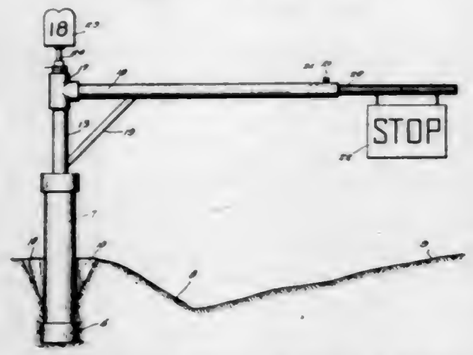
2,409,073
CAPACITOR FUEL GAUGE
Frederick R. Sias, Lynnfield Center, and Donald B. Pearson, Marblehead, Mass., assignors to General Electric Company, a corporation of New York
Application March 7, 1945, Serial No. 581,494
6 Claims. (Cl. 177—351)

1. An oscillation circuit measuring system comprising a vacuum tube having cathode, control grid and plate electrodes, a tuned input circuit connected between the cathode and grid containing a variable measurement condenser, a tuned output circuit including a direct current source of supply connected between the cathode and plate, said tuned circuits including a coil connected across the input circuit and a coil connected in the output circuit for coupling said circuits, a measuring instrument responsive to changes in current in the output circuit caused by variations of the measurement condenser in the input circuit, variable resistance means in the output circuit for obtaining full scale instrument adjustment, variable capacitance connected across the coil in the output circuit for varying the tuning of such circuit and obtaining zero scale instrument adjustment, and a grid leak in the grid connection of said vacuum tube including resistance having a temperature coefficient of resistance selected to compensate said measuring system for temperature errors.

2,409,074
DRAWBRIDGE INTERLOCKING
Roger Mills Snyder, Norfolk County, Va., assignor to The Union Switch and Signal Company, Swissvale, Pa., a corporation of Pennsylvania
Application July 18, 1944, Serial No. 545,523
6 Claims. (Cl. 246—118)

1. In an interlocking for a drawbridge over which the rails of a stretch of railway track pass, locks for locking the rails on said bridge in the proper positions relative to the rails on the bridge abutments for the passage of trains over said bridge, manually operable means operatively connected with said rail locks for actuating them between locking and unlocking positions, an electric lock controlling the operation of said manually operable means, two detector track sections one extending onto said bridge at each end of said bridge, means controlled in part by said detector sections for controlling the energization of said electric lock, said electric lock being effective when deenergized to prevent operation of said manually operable means away from the position in which said rail locks are in their locking positions, a control circuit controlled in accordance with the energized or deenergized condition of said electric lock and including a single pair of control wires extending across said bridge, and signals governing the passage of trains over said bridge controlled by said control circuit.

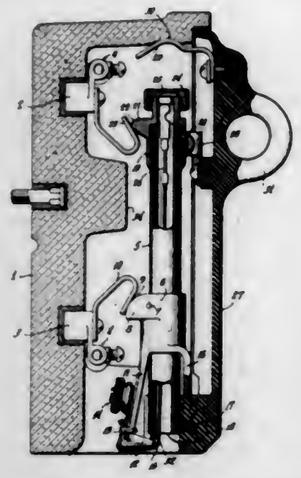
2,409,075
EXTENSIBLE STAND
Arthur M. Starck, Stamford, Conn.
Application November 18, 1944, Serial No. 564,110
2 Claims. (Cl. 248—161)



1. In a telescoping stand having stationary and movable relatively non-rotatable portions, a device for counterbalancing the weight of the movable portion, said device comprising a helical compression spring non-rotatably secured at one end to the stationary portion, a cap member rigidly secured to the other end of said spring, and an elongated member non-rotatably secured at one end to the movable portion and provided with a helical element extending through and threadedly engaging said cap member to torsion

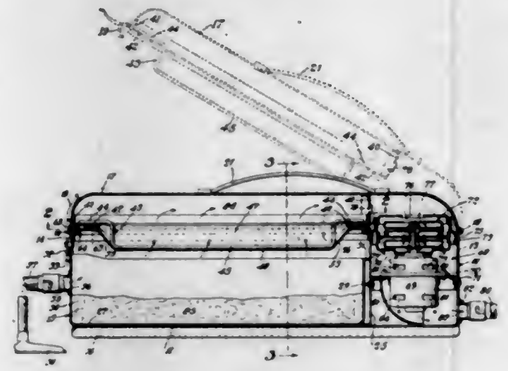
said spring, said cap member reacting under the torsional force of said spring to provide a vertical

force adapted to support the weight of said movable portion.



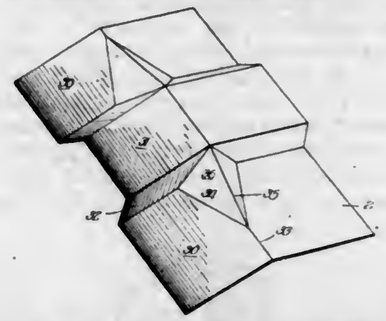
2,409,076
SWINGABLE ROAD SIGN
Harry J. Steinberger and Sam Sanders, Artesia, N. Mex.
Application December 27, 1944, Serial No. 570,027
1 Claim. (Cl. 40—145)

A road sign comprising a base, a tubular member fixed to the base and rising therefrom, a tubular housing rising from the base and adapted for embedding in the ground, a cylindrical guide positioned in the member and projecting upwardly therefrom, said member having an inclined upper edge, a tubular post having a correspondingly inclined lower edge rotatably supported on said member and receiving said guide, a horizontal arm attached to the upper end of the post and adapted to rotate the post upon an object engaging and moving the arm, and spring means exerting a downward pressure on the post to yieldably maintain the inclined edges in matching relation.



2,409,077
EXPULSION FUSE
Alwin G. Steinmayer, Milwaukee, Wis., assignor to Line Material Company, South Milwaukee, Wis., a corporation of Delaware
Application June 4, 1943, Serial No. 489,599
10 Claims. (Cl. 200—114)

1. A housed type of drop-out fuse construction comprising a housing, a fuse tube pivotally supported from the housing and normally positioned within the housing, pivot means fixedly carried by said fuse tube, a door pivoted on said pivot means, said fuse tube having spaced contacts, stationary contacts carried by said housing and normally engaging the contacts of said fuse tube, a fuse link within said fuse tube normally electrically connecting the contacts of said fuse tube and coacting with said door to nor-

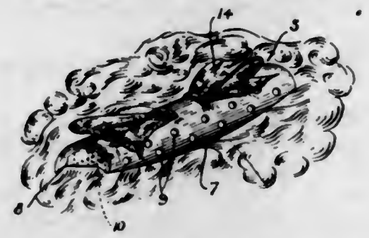


mally prevent said door from pivoting with reference to said fuse tube, said door being biased towards rocking motion with reference to said fuse tube and said fuse tube being biased towards rocking motion with reference to said housing, said door normally interlocking with said housing and releasing itself from said housing when said door rocks with reference to said fuse tube.

2,409,078
SUCTION CLEANER
Edward R. Swann, Floral Park, N. Y., assignor to The Hoover Company, North Canton, Ohio, a corporation of Ohio
Application October 13, 1943, Serial No. 506,043
3 Claims. (Cl. 183—71)

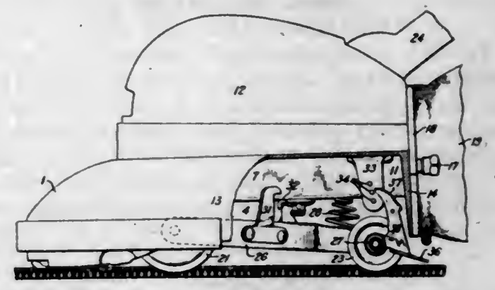
1. A suction cleaner comprising a casing, a movable cover for said casing, a filter having elongated corrugations including alternate ridges and depressions each terminating at their opposite ends in one plane at the marginal edge of said filter, cooperating means on said cover and casing each in one plane, closing said cover clamping said marginal edge of said filter in one plane, and a filter supporting frame mounted in said cover and movable therewith, closing said cover positioning said frame only in the said ridges of said filter to support said ridges against the force of said air stream and said depressions unsupported.

2,409,079
RAILWAY CAR ROOF STRUCTURE
James S. Swann, Homewood, Ill., assignor to Standard Railway Equipment Manufacturing Company, Chicago, Ill., a corporation of Delaware
Application April 2, 1945, Serial No. 586,090
5 Claims. (Cl. 108—5.4)



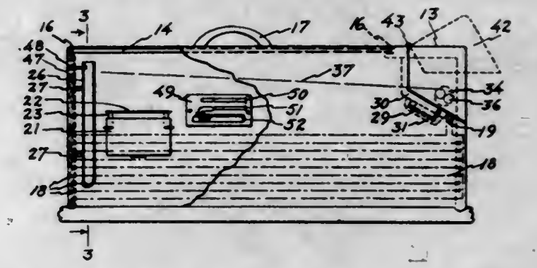
1. A car roof sheet of thin metallic material having a main portion, an offset portion in a plane substantially parallel to said main portion, and a web connecting said portions, said portions and said web being bent to form a ridge extending transversely of said sheet, said sheet formed with an embossment springing from the ridge of said main portion and merging with the adjacent edge of the ridge of the offset portion and merging into said main portion and web on opposite sides of said ridge.

2,409,080
PREPARATION OF ALKYLATED CYCLIC HYDROCARBONS
Carlisle M. Thacker and Richmond T. Bell, Highland Park, Ill., assignors to The Pure Oil Company, Chicago, Ill., a corporation of Ohio
No Drawing. Application March 4, 1944, Serial No. 525,100
17 Claims. (Cl. 260—671)



6. The method of alkylating benzene which comprises contacting a mixture of benzene and a sulfur compound selected from the group consisting of alkyl mercaptans and alkyl sulfides with copper pyrophosphate at a temperature of approximately 200–525° C.

2,409,081
ORNAMENTAL HAIR CURLER COVER
Julia R. W. Torrens, Lake Jackson, Tex.
Application July 19, 1945, Serial No. 605,933
4 Claims. (Cl. 132—31)



4. As a new article of manufacture, an accessory fashioned to receive, enclose and wholly conceal an unsightly tubular hair curler, comprising a mask, said mask being in the form of a hollow shell of elongated concavo convex form and including longitudinal side portions and enclosing transverse end portions, said end portions being provided with laterally inturned attaching and retaining fingers adapted to fit into open ends of the tubular portion of the aforementioned hair curler.

2,409,082
SUCTION CLEANER
Charles G. Troxler, Canton, Ohio, assignor to The Hoover Company, North Canton, Ohio, a corporation of Ohio
Application April 19, 1943, Serial No. 483,557
7 Claims. (Cl. 15—16)

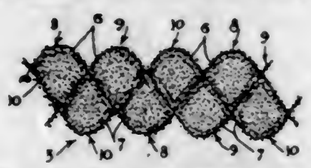
3. In a suction cleaner, a first part comprising a body including a nozzle adapted to drop down into contact with an underlying surface covering and to determine the plane of the aforesaid top surface thereof, said first part also comprising a first supporting wheel fixed to said body, a second part comprising a second supporting wheel movable relative to said body, and means to adjust said second supporting wheel relative to said body to position said nozzle relative to said surface covering through determining the angular position of said body on said first supporting wheel, said means including a plurality of fixed contacts carried by one of said parts and a movable operator-operable element carried by the other part and provided with a cam surface adapted selectively to engage said fixed contacts, said cam surface shaped as to cam said second supporting wheel relative to said body to alter its position relative thereto to raise said nozzle from a position in contact with said surface covering for determining the plane of the top surface thereof to an optimum operating position thereabove.

2,409,083
ENCLOSURE FOR BASSINETS
Robert Valverde, New York, N. Y.
Application August 25, 1943, Serial No. 500,023
3 Claims. (Cl. 128—1)

1. An incubator for premature infants, said incubator comprising a cabinet having an open bottom, the edges of which form a rectangle slightly smaller than the top surface of a mattress of a hospital bassinet so as to enclose the infant completely, the cabinet also having a top opening of substantial size and through which a nurse can service an infant in the incubator, a flange around the top opening, and a transparent cover that fits within the flange and closes said top opening of the incubator, said transparent cover being free along all four sides so that any edge of the cover can be tipped up above the edge of the flange and the cover slid toward the tipped-up edge to provide an opening of any desired width along any side of the cabinet.

2,409,084
PROCESS OF BLEACHING AND STERILIZING STARCH
George Paul Vincent, Poughkeepsie, N. Y., assignor to The Mathieson Alkali Works, Inc., New York, N. Y., a corporation of West Virginia
No Drawing. Application August 3, 1940, Serial No. 351,207
5 Claims. (Cl. 127—71)

1. In the bleaching and sterilizing of starch, the improvement which comprises subjecting the starch in a substantially dry state to the action of an activated soluble, inorganic chlorite by intimately admixing the starch with the chlorite and activating the chlorite while in admixture with the starch by an acid in a non-liquid state.

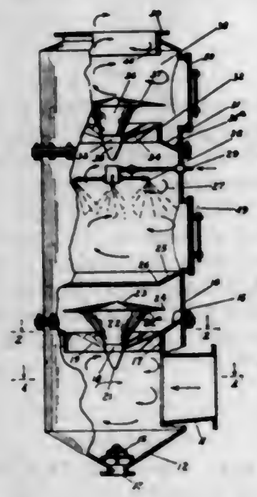


2,409,085
STARCH SOLUBILIZATION
George P. Vincent, Briarcliff Manor, N. Y., assignor to The Mathieson Alkali Works, Inc., New York, N. Y., a corporation of Virginia
No Drawing. Application January 25, 1944, Serial No. 519,660
4 Claims. (Cl. 127—33)

1. A process which comprises treating starch in an acid aqueous medium with about 0.15% to 2.5% by weight on the starch of a soluble inorganic chlorite in the presence of an activating agent for the chlorite, the agent being present in an amount effective to activate the chlorite, the temperature and the duration of he treatment being such as to result in substantial solubilization of the starch.

2,409,086
REACTION PRODUCTS OF NITRILES AND ALDEHYDES
Joseph Frederic Walker, Lewiston, N. Y., assignor to E. I. du Pont de Nemours & Company, Wilmington, Del., a corporation of Delaware
No Drawing. Application May 1, 1943, Serial No. 485,361
1 Claim. (Cl. 260—464)

As a new chemical compound γ-formyl pimelonitrile.

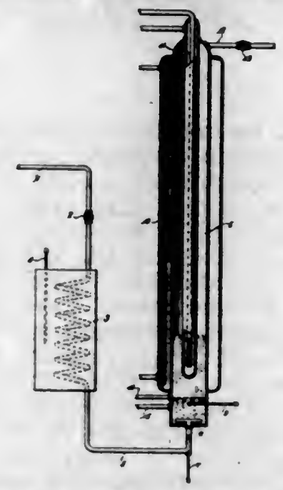


2,409,087
WOVEN CLOTH
Jan V. Weinberger, Truro, Nova Scotia, Canada
Application August 10, 1945, Serial No. 610,077
In Canada October 21, 1943
7 Claims. (Cl. 139—390)

1. A woven cloth comprising a plurality of courses of large gauge weftwise extending fillers bound in place and crushed together by a plurality of intersecting woven binding fabrics.

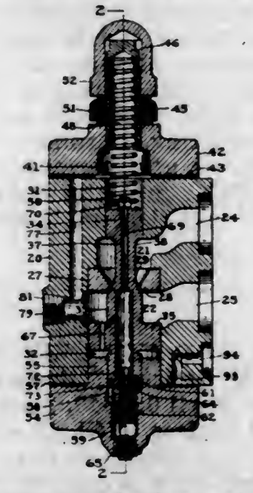
2,409,088
DEVICE FOR WASHING AND CONDITIONING AIR AND GASES
John Weits, Baldwin, and Hans Held, Flushing, N. Y.
Application July 9, 1943, Serial No. 493,962
5 Claims. (Cl. 183—21)

4. An air cleansing device comprising in combination a cylindrical casing having a vertical axis, comprising an intake chamber at the bottom, a spray chamber above said intake chamber and a separating chamber above said spray chamber, said intake chamber having a tangential inlet to establish a rotary motion in incoming air to form a rotating column within said intake chamber, said spray chamber having jets for projecting a spray through air rotating in said spray chamber, an annular baffle extending inwardly and downwardly from said casing between said intake chamber and said spray chamber, a second annular baffle extending inwardly from said casing between the spray chamber and the separating chamber, each of said baffles having a central opening, an inverted conical deflector supported within and extending downwardly into the opening of each of said baffles, each forming with the



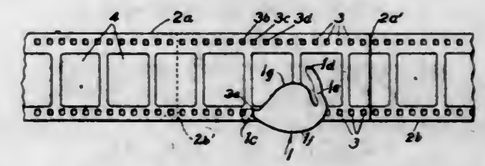
baffle an upwardly and outwardly extending annular channel, a set of vanes for said first mentioned conical deflector and a set of vanes for said second mentioned conical deflector, all of said vanes being attached along their inner edges to each of said conical deflectors and extending from said point of attachment radially outward, and attached along their outer ends to corresponding annular baffle dividing each of said channels into a plurality of upwardly extending passageways, said vanes being inclined to the vertical, one set to receive the rotating column of air from said intake chamber and maintain it in rotation and deliver it smoothly into the spray chamber and the other set to receive the rotating column of air from said spray chamber and maintain it in rotation and deliver it smoothly into the separating chamber.

2,409,089
DIRECTIONALLY STIFF WOVEN FABRIC AND METHOD
Ross C. Whitman, Walpole, Mass., assignor to The Kendall Company, Boston, Mass., a corporation of Massachusetts
Application May 17, 1943, Serial No. 487,360
18 Claims. (Cl. 139—420)



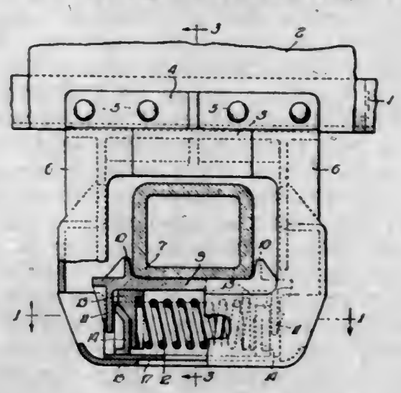
1. A woven fabric having much greater stiffness in one yarn direction than in the other, comprising sets of warp and filling yarns interwoven with each other, one of said sets consisting mainly of fused cellulosic oppositely twisted yarns materially stiffer than those of the other set and providing greater stiffness in their direction.

2,409,090
ETHYLENE ALKYLATION
Robert E. Woodward, Westville, and Wendell P. Hawthorne, Wenonah, N. J., and Jacob R. Meadow, Memphis, Tenn., assignors to Socony-Vacuum Oil Company, Incorporated, a corporation of New York
Application November 29, 1944, Serial No. 565,787
8 Claims. (Cl. 260—683.4)



1. A process for the synthesis of valuable hydrocarbon products by alkylation of isoparaffins with ethylene which comprises forming a vapor phase charge mixture containing ethylene and isoparaffin, dispersing said charge mixture as a vapor at a temperature of 400° F. to 1000° F. into a body of liquid hydrogen fluoride maintained at a temperature of about 100° F. to 200° F. under a pressure sufficient to maintain liquid hydrogen fluoride in said body, separating hydrocarbons from hydrogen fluoride and separating valuable synthetic products from the separated hydrocarbons.

2,409,091
HYDRAULIC APPARATUS
Fred J. Wright, Columbus, Ohio, assignor to The Denison Engineering Company, Columbus, Ohio, a corporation of Ohio
Application February 29, 1944, Serial No. 524,407
12 Claims. (Cl. 137—15.3)

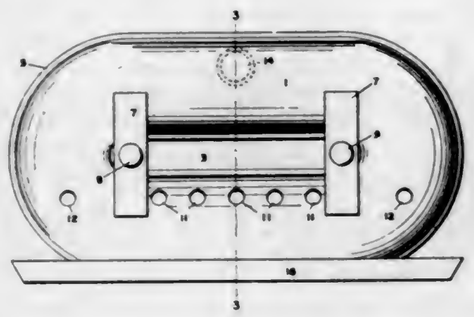


1. A fluid pressure reducing valve comprising, in combination, a valve body having inlet and outlet ports and a passage connecting the same; valve means in said body for dividing the passage into a high pressure chamber and a low pressure chamber connected, respectively, to said inlet and outlet ports, said valve means including a valve seat and a valve movable onto and away from the seat for controlling the flow of fluid between said chambers, said high pressure chamber including a cylinder; a movable body, including said valve, forming a piston, said piston being slidable in said cylinder, one of said bodies providing a restricted passage leading to opposite ends of the piston, said body forming a third chamber and a passage connecting the same with a source of pressure; and means responsive to an increase in pressure in the third chamber for actuating the movable body to decrease communication between said chambers.

2,409,092
SPLICE FROG FOR TEMPORARILY JOINING MOTION-PICTURE FILM SECTIONS
Joseph Yolo, Yakima, Wash.
Application October 19, 1944, Serial No. 559,470
7 Claims. (Cl. 88—19.5)

4. In a splice frog for temporarily joining lapped motion picture film sections having two rows of aligned sprocket sprocket wheel apertures, the combination of a body portion having oppositely disposed edges, a head portion hooked toward one edge of said body portion and adapted to be inserted through a pair of aligned said apertures of one row, and a tail portion adapted then to be inserted slantwise through a pair of said aligned apertures in the other row by turning said body portion in the general direction toward its other edge.

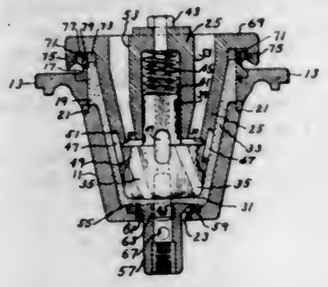
2,409,093
CAR COUPLER CENTERING DEVICE
Kurt E. Zeidler, Chicago, Ill., assignor to Standard Railway Equipment Manufacturing Company, Chicago, Ill., a corporation of Delaware
Application June 3, 1943, Serial No. 489,559
6 Claims. (Cl. 213—21)



3. A coupler carrying and centering device for a railway car having a member rigidly mounted thereupon and adapted to support a coupler shank, said device comprising a carrier having spaced upwardly projecting lugs adapted to receive a coupler shank therebetween and spaced depending flanges, a pair of telescopic followers

adjacent each flange, the outer follower of each pair supported by said member and slidable thereupon and engageable therewith to limit the outward movement of said follower, and the inner follower of each pair supporting said carrier between said flanges, and a coil spring between the paired followers, each pair of followers having downwardly and inwardly inclined surfaces arranged so that a downward and/or lateral movement of said carrier causes compression of said spring and is thereby resiliently resisted so that said parts are returned to normal when free to do so.

2,409,094
BALLAST BLOCK
Carl C. Ahles, Albany, N. Y.
No Drawing. Application May 29, 1943, Serial No. 489,257
4 Claims. (Cl. 106—97)



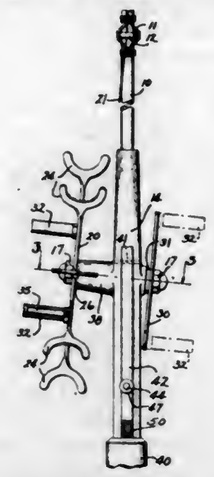
1. A magnetic ballast block having a specific gravity of the order of 3 and up and formed of concrete comprising, by weight, about one part of hydraulic cement and from about four to about eight parts of magnetite.

2,409,095
RETORT TYPE OIL BURNER
Ernest J. Ashby, Indianapolis, Ind.
Application September 16, 1944, Serial No. 554,506
1 Claim. (Cl. 158—63)

An oil burner comprising a two part vaporizing chamber of circular form in cross section and oval form in elevation, both parts of the chamber being substantially similar in form and of completely curved form throughout the interior of each part, the two parts of the chamber being hollow and fitted edge to edge to complete a substantially closed chamber, the chamber having a central web in line with the junction of the meeting edges of the two parts of the chamber with the central web formed with an opening, a pin passed through said opening, a plate on each side of the chamber in parallelism with the central web through which the pin is passed, a head on one end of the pin to bear against one plate, and a wedge key to be passed through an opening in the pin to overly the other plate to secure the parts of the sectional chamber removably together, a supply pipe entering the chamber near the top thereof, the chamber being formed in parallelism with the central web and throughout the length thereof with openings for the escape of the vapor of the medium used, and further formed beyond such escape openings with further openings for the admission of air to the chamber, the wedge key maintaining the junction of the chamber parts under a sealing tension and permitting ready separation of the chamber parts when desired.

2,409,096
PLASTIC FORMING APPARATUS
William J. Baird, Birmingham, and William N. Sparks, Inkster, Mich.
Application November 24, 1944, Serial No. 564,984
3 Claims. (Cl. 25—26)

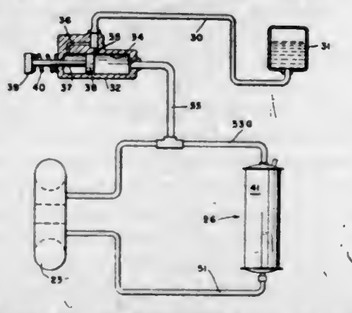
1. A spinner for rotatable insertion into a mold for shaping plastic material to form smoothly finished ware comprising, a body of substantially circular cross-sections, the upper end of said body being adapted for mounting upon axial rotation means, a nose on the other end of said body, means for slidably supporting said nose on said body for movement toward the body to define a contiguous peripheral surface therewith and for movement away from the body to separate formed wares therefrom, the adjacent portions of said body and nose being formed to meet along a plane at right angles to the axis of rotation, trimming means around the upper end of said body, an elongated driving and wiping key, key receiving slots extending in aligned interconnecting relation in the adjacent peripheral surfaces of said body and nose for receiving said key flush with said surfaces, and one end of said key being secured in one of said slots so that the other end of the key may slide back and forth in the other slot as the nose is moved toward or away from the body.



2,409,097
ELECTROLYTIC POLISHING
Clements Batcheller, Glens Falls, N. Y.
No Drawing. Application January 7, 1941, Serial No. 373,461
3 Claims. (Cl. 204—140)

1. The method of polishing the surface of a metal alloy of the group consisting of "Monel" metal and the chrome-nickel stainless steels, which comprises subjecting the alloy to electrolytic action as anode at a current density of from about ½ to about 30 amperes per square inch and in an electrolyte containing a plurality of ingredients of which the following, in the percentages by weight stated, are the only necessary ingredients, free sulphuric acid from about 15% to about 55%, a second acid selected from the group consisting chromic, vanadic, metavanadic, manganic and permanganic from about 2% to about 20%, and the balance water; the temperature of said electrolyte being in execess of about 160° F.

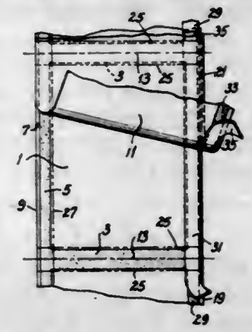
2,409,098
FISHING ROD AND REEL ASSEMBLY
John M. Benson, Milwaukee, Wis.
Application April 6, 1945, Serial No. 586,938
8 Claims. (Cl. 43—20)



1. A fishing rod and reel assembly comprising the combination with a casting rod, of a transverse reel supporting shaft obliquely mounted in the rod, and an open reel disk fixedly secured to

the shaft at one end and provided with transversely disposed arcuate line-gathering wings, radially spaced from the disk, a brake lever pivoted to the rod in bearing relation to said shaft,

and a spring interposed between the actuating arm of the brake lever and the rod in a position to normally urge the lever out of bearing contact with the shaft.

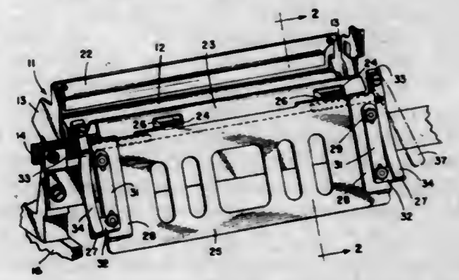


2,409,099
BRAKE COOLER
John J. Bloomfield, Burbank, Calif., assignor, by mesne assignments, to Lockheed Aircraft Corporation, a corporation of California
Application July 12, 1943, Serial No. 494,330
8 Claims. (Cl. 188—264)

1. In a brake system having a brake drum, friction means operable into cooperation with the drum and a fluid pressure system for operating the friction means, the combination of coolant discharge means for discharging coolant adjacent the drum and friction means, and means controlled and operated by said fluid pressure system for supplying coolant under superatmospheric pressure to the discharge means including piston means actuated by the fluid pressure in said system and operable to impose pressure on the coolant to force the same to the discharge means.

2,409,100
BAG STRUCTURE AND PROCESS OF MANUFACTURE
Charles V. Brady, Webster Groves, and Russell J. Williams, Richmond Heights, Mo., assignors to Bemis Bro. Bag Company, St. Louis, Mo., a corporation of Missouri
Application November 1, 1943, Serial No. 508,534
6 Claims. (Cl. 93—35)

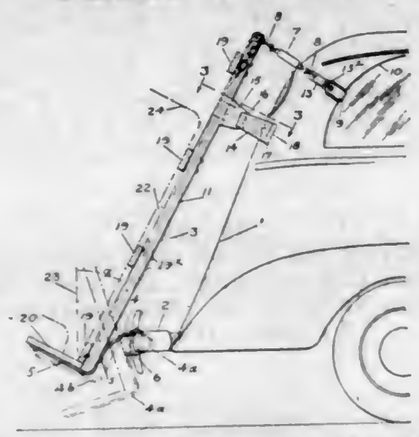
3. A method of manufacturing bags comprising applying to a continuous web portion of material laterally located and longitudinally spaced bars of adhesive, applying longitudinal stripes joining the ends of said bars of adhesive and located near the edges of said web, applying a continuous tape over one of said stripes to cover the same, said last-named stripe being tacky to permit tape removal, applying an edgewise stripe of tacky adhesive to a second web portion of material, applying said second web portion to the



first web portion so as to bring its stripe of tacky adhesive opposite said tape-covered stripe on the other web, locating a second covering of continuous removable tape between the last-named adhesive and the first-named tape, and segmenting both web portions and the tapes in the regions of said laterally located adhesive bars.

2,409,101
FINGER OR HAND ATTACHMENT
Vertner D. Brittingham, Dearborn, Mich.
Application November 23, 1943, Serial No. 511,409
1 Claim. (Cl. 2—21)

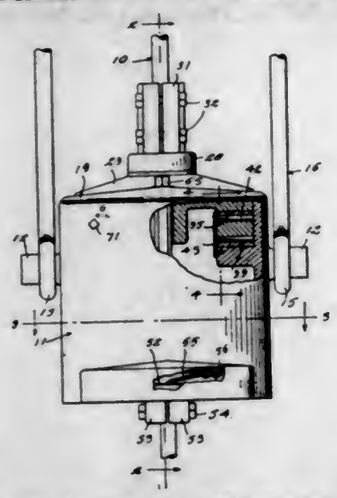
A finger attachment comprising an element formed from hard surfaced material and adapted to be positioned over a finger of the user, said element having on the outer surface a pair of relatively large flat surfaces angularly disposed one to the other, said surfaces abutting on the ball side of the finger along substantially the center line of the finger, whereby the flat surfaces on an attachment positioned on the user's thumb will engage corresponding flat surfaces on two other similar attachments on the fingers to provide an improved gripping action.



2,409,102
GUIDING MEANS
Charles W. Burcky, Park Ridge, Ill., assignor to Teletype Corporation, Chicago, Ill., a corporation of Delaware
Application January 29, 1945, Serial No. 575,131
3 Claims. (Cl. 197—133)

1. In a printing apparatus, a stationary frame, a platen carriage movable upon said frame for character spacing, a convex apron at the rear of said carriage having a set of slots near the

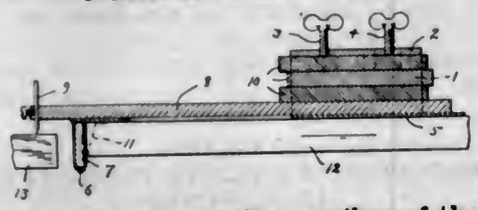
rearmost edge thereof, a paper guiding chute having ears insertable into said slots for supporting said chute to extend obliquely downwardly from said apron, a pair of flat spring hold-down clamps pivotally attached to said carriage, one adjacent each edge of said chute, cooperating lugs on said chute, whereby said clamps are adapted to be superimposed upon said lugs to retain said chute and to be swung clear of said lugs to render said chute readily detachable, and means on said chute coactive with the extremities of said clamps to obviate disalignment of said chute with respect to the paper.



2,409,103
AUTOMOBILE LUGGAGE CARRIER
John C. A. Cameron, Washington, D. C.
Application August 17, 1943, Serial No. 498,963
3 Claims. (Cl. 224—29)

1. An automobile luggage carrier which includes: a frame composed of uprights connected by cross arms; a foot-board at the bottom of said frame; shock-absorbing leaf spring members, one end of each leaf-spring member being secured to the lower part of the frame and extending upwardly from the same, the other end of each leaf-spring member being formed into a hook to hook over and under the rear bumper of an automobile; blocks secured to said uprights; a bar shaped to fit crosswise of the back of the automobile and having portions engaged by said blocks with rolling contact; and means to connect the upper part of the frame with the side windows of the automobile.

2,409,104
SUCKER ROD TIGHTENER
James D. Cavaness, Arlington, Tex.
Application February 26, 1945, Serial No. 579,877
5 Claims. (Cl. 255—14)

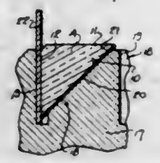


1. A sucker rod tightener comprising a housing engaging about polish rod, oppositely extending trunnions carried by said housing, means engaging said trunnions supporting said housing for vertical reciprocating movement, and means in said housing for effecting rotation of said rod in one direction upon upward movement of said housing, said latter means including a pair of oppositely disposed wedge members slidably mounted in said housing, a plate, movable endwise with respect to said housing and rotatable about said rod, said plate formed with inclined surfaces engageable with said wedge members for sliding said wedge members upon vertical movement of said housing, a pair of rock levers engageable at one end thereof with said wedge members, whereby movement of said wedge members will rock said levers, a pair of oppositely disposed pawls carried by the opposite ends of said levers, and a toothed plate loose in said housing and fixed to said rod, said pawls engaging said plate to thereby effect the rotation of said plate upon rocking of said levers in one direction.

2,409,105
ELECTRICAL TIMING ARRANGEMENT
David Adam Christian, Batley, England, assignor to Siemens Brothers & Co. Limited, London, England, a British company
Application October 21, 1943, Serial No. 507,115
In Great Britain November 19, 1942
14 Claims. (Cl. 179—16)

1. Electrical timing apparatus for deriving a time interval which bears a linear relation to a given time interval comprising first and second timing means arranged to be operated at different rates, means for starting the first timing means at the beginning of the given time interval, means for starting the second timing means at the end of the given time interval, and means controlled by said two timing means responsive to their reaching a common condition for determining the duration of the derived time interval.

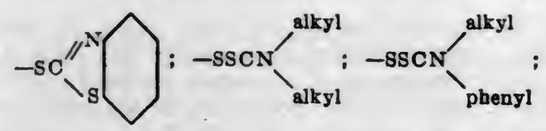
2,409,106
SCRIBER
Robert T. Connelly, Duluth, Minn.
Application March 17, 1944, Serial No. 526,968
3 Claims. (Cl. 33—41)



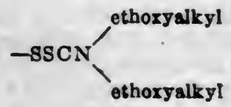
1. The combination with a scriber of the class described having a hollow body portion normally open at opposite ends, an arm-like gauging member carried upon the lowermost longitudinal face of said body portion, a gauging beam longitudinally adjustable within said body portion, and means for holding same in any of its adjusted positions; of means carried by said body portion for selective positioning of said beam in spaced relation perpendicularly in respect to said arm-like member.

2,409,107
PROCESSING OF CERTAIN NONGELATIN EMULSIONS
John I. Crabtree and George T. Eaton, Rochester, N. Y., assignors to Eastman Kodak Company, Rochester, N. Y., a corporation of New Jersey
No Drawing. Application October 16, 1942, Serial No. 462,233
4 Claims. (Cl. 95—88)

1. The method of treating an exposed photographic element which comprises immersing the element including a layer of a polyvinyl resin which contains a silver salt and which is not readily permeable to processing baths, in a processing bath which contains an inorganic thiocyanate and ethanolamine.



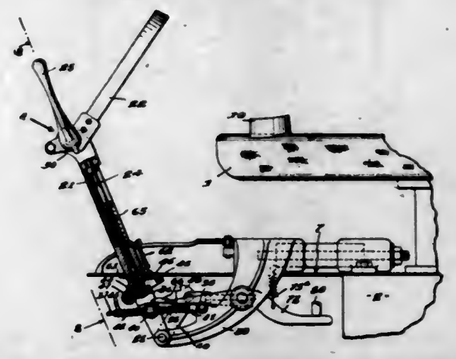
2,409,108
PROCESS OF FORMING GLASS PRISMS
Joseph P. Crowley, Toledo, Ohio, assignor to Libbey-Owens-Ford Glass Company, Toledo, Ohio, a corporation of Ohio
Application November 2, 1942, Serial No. 464,174
3 Claims. (Cl. 51—283)



2. In apparatus for the processing of solid glass prism blanks having a hypothenuse face and two side faces extending at angles with respect thereto, a recessed table for supporting said blanks during grinding and polishing, said recess having an accurately machined inclined wall for receiving the hypothenuse face of the prism blank and an accurately machined substantially vertical wall, and spacing means adapted to be inserted between the substantially vertical wall of the recess and a side wall of said prism blank to properly position the said blank within said recess with the side face thereof to be ground and polished above the top of the supporting table.

2,409,109
DIARYL GUANIDINE ADDITION PRODUCTS
Arnold Rogers Davis, Riverside, Conn., assignor to American Cyanamid Company, New York, N. Y., a corporation of Maine
No Drawing. Application August 7, 1944, Serial No. 548,497
5 Claims. (Cl. 260—306.6)

1. A reaction product of one to two mols of a diaryl-guanidine and one mol of a zinc salt having the formula $Zn(X)_2$ in which X represents a member of the group consisting of the

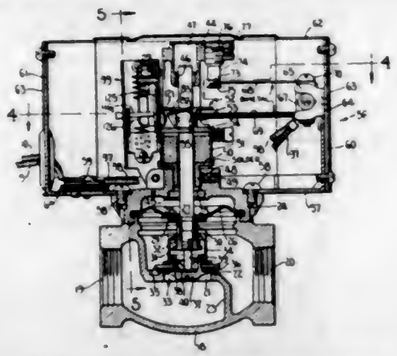


and

radicals.

2,409,110
NECK BAND CLAMP MECHANISM
Ernest Davis, Syracuse, N. Y., assignor to The Prosperity Company, Inc., Syracuse, N. Y., a corporation of New York
Application January 6, 1941, Serial No. 373,257
8 Claims. (Cl. 38—13)

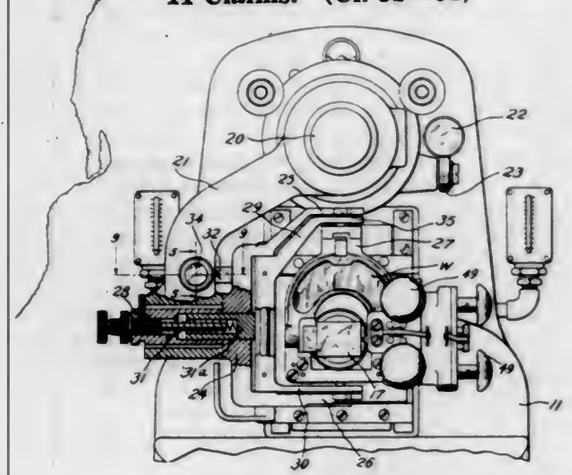
1. In a neck band clamping mechanism for garment presses including a pressing element provided with a neck band form, said mechanism including a carrier, a neck band clamping member pivoted thereto, the carrier being movable to carry the clamping member into a position over said element, a handle supported by the carrier and operable to swing the clamping member relative to the carrier into a position overreaching and spaced from the form, spring means between the handle and the clamping member operable to yieldingly transmit the movement of the handle to the clamping member, and permit the handle to have an additional movement when the clamping member is in operative position, the clamping member being movable into frictional locking engagement with the form, returning means acting on the carrier tending to return it to starting position and cause the clamping member to move from its overreaching position into frictional coaction with the form upon the additional movement of the handle, returning means tending to move the clamping member in a retrograde direction relative to the carrier, means operable by the additional movement of the handle to apply increased force to the carrier and hold the clamping member in frictionally locked contact with the form, and means operable to release the holding means.



2,409,111
PYROTECHNIC DEVICES
Tenney L. Davis, Norwell, Mass., assignor to National Fireworks, Inc., Hanover, Mass., a corporation of Massachusetts
No Drawing. Application January 21, 1943, Serial No. 473,097
4 Claims. (Cl. 52—23)

1. A pyrotechnic composition designed to produce a colored smoke, comprising a volatile colored organic compound and a cool guanidine explosive.

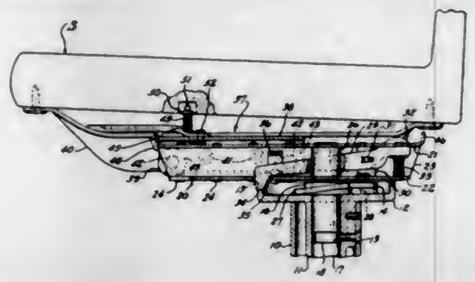
2,409,112
AUTOMATIC VALVE
Earnest J. Dillman, Detroit, Mich., assignor to Detroit Lubricator Company, Detroit, Mich., a corporation of Michigan
Application June 3, 1942, Serial No. 445,571
27 Claims. (Cl. 137—139)



23. An automatically operable valve, comprising a valve member having a stem, an abutment on said stem, automatic means operable to move said valve member toward open position, a piv-

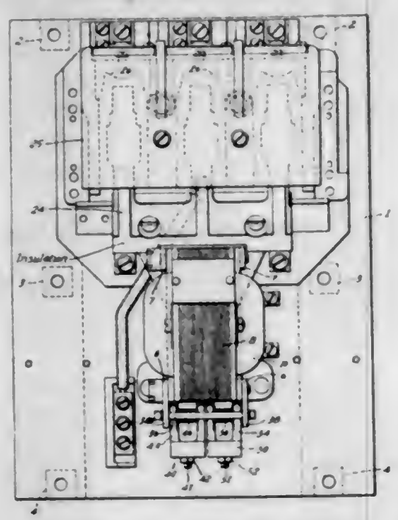
oted arm extending into the path of movement of said abutment and spaced from said abutment in valve member closed position, said arm having a cam portion, an adjustable stop member movable along said cam portion to determine the

spacing of said arm from said abutment in valve member closed position, and means acting on said arm to interrupt opening movement of said valve member, said automatic means being operable to overcome said acting means and continue the opening movement of said valve member.



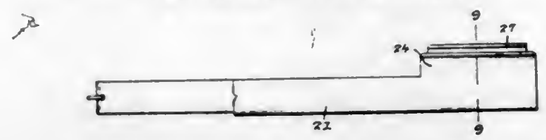
2,409,113
GAUGE LAPPING MACHINE
Alden M. Drake, West Hartford, Conn., assignor to Niles-Bement-Pond Company, West Hartford, Conn., a corporation of New Jersey
Application June 27, 1944, Serial No. 542,288
11 Claims. (Cl. 51—64)

4. An operating mechanism for the lapping member of a lapping machine comprising a rotatable spindle having an eccentric at one end, a slide reciprocated thereby in a vertical plane normal to the axis of said spindle, a second slide mounted within said first mentioned slide for free movement in a plane at right angles to the plane of movement of said first slide, and a lapping member having opposite plane parallel lapping surfaces mounted in said second slide for free rotary movement about its longitudinal central axis.



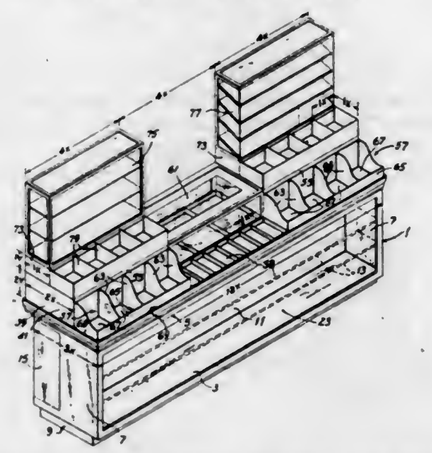
2,409,114
ADJUSTABLE CHAIR SEAT
Tom Elleman, Port Washington, and Roy W. Johnson, Milwaukee, Wis., assignors, by mesne assignments, to The Seng Company, Chicago, Ill., a corporation of Illinois
Application May 18, 1944, Serial No. 536,092
6 Claims. (Cl. 155—95)

1. In a chair seat support, a relatively-fixed bearing, a slide support mounted for rotation with respect to said bearing, a locking lever carried by one of said relatively movable parts and engageable with the other to prevent relative movement therebetween, a seat-carrying slide carried by said slide support and laterally movable with respect thereto, and camming means between said locking lever and said slide to move said locking lever to disengaged position when said slide is in its fully retracted position.



6. In a chair seat support, a slide support comprising a top plate and a lower plate spaced apart by side plates extending therebetween, said side plates being spaced inwardly from the edges of said top and lower plates to form a pair of tracks, a chair seat carrying slide having a top portion and down-turned side flanges, said down-turned side flanges overlapping the edges of the top plate of said slide support, non-metallic rollers carried on the inner surface of each of said down-turned side flanges, said rollers riding in said tracks and being fixedly spaced relative to each other and to said slide top portion.

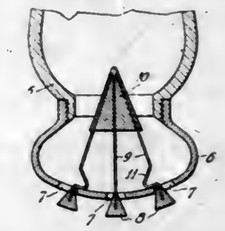
2,409,115
SHOCKPROOF CONTACTOR
Delbert Ellis and Owen L. Taylor, Wilkinsburg, and Robert T. Basnett, Edgewood, Pa., assignors to Westinghouse Electric Corporation, East Pittsburgh, Pa., a corporation of Pennsylvania
Application December 8, 1943, Serial No. 513,364
7 Claims. (Cl. 74—527)



1. An electric apparatus comprising, in combination, a base plate for mounting the apparatus, an operating member mounted on said plate for motion between two positions, a movable latch arranged for locking said member in either of said positions and normally biased for motion in unlocking direction, and a stop member arranged for limiting the unlatching motion of said latch and movably mounted for motion toward and away from said base plate, said stop member having a portion normally resting against said plate so that said stop member is flung toward said latch in order to move it into latching position when said plate is subjected to high impact shock in the moving direction of said stop member.

2,409,116
SAFETY RAZOR BLADE HOLDER
Alfred Felardo, Bronx, N. Y.
Application January 10, 1944, Serial No. 517,716
4 Claims. (Cl. 30—334)

1. A holder of the kind described, comprising interfitting slidably related relatively flat members, one of which is bent upon itself longitudinally to have relatively spaced substantially parallel sides between which the other member is slidably received, means for anchoring a razor blade within the innermost member, and laterally extending opposed jaws formed on the outermost member for engaging and supporting the razor blade when anchored.



2,409,117
STORE FIXTURE
George G. Fero, Newton Upper Falls, Mass., assignor to United-Rexall Drug Company, a corporation of Delaware
Application May 2, 1945, Serial No. 591,462
7 Claims. (Cl. 312—107)

1. A counter comprising a unit having a bottom, closed ends and a top, a longitudinal divider in the counter, removable end panels within said ends flush with the backs of the counter and covering openings in the ends to which a cooperating pair of doors may be applied to form common unobstructed entry means into the space between two dividers when two counters are used back to back.

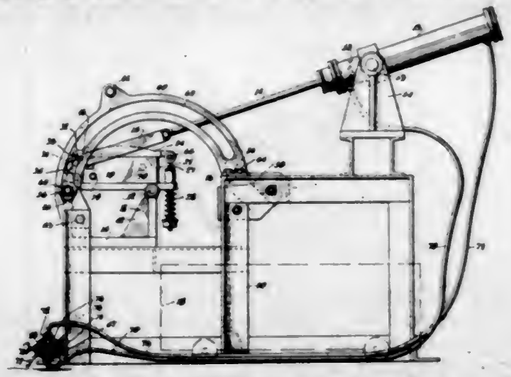
2,409,118
CONDIMENT HOLDER
Glen D. Fleak, Beaumont, Tex.
Application September 24, 1943, Serial No. 503,617
2 Claims. (Cl. 65—57)

1. An article of the class described, comprising a container having a plurality of small spaced dispensing openings in a wall thereof, a tapering plug extending into each opening from the exterior and movable into said opening far enough to completely close it, and resilient rods secured to said plugs and extending from the smaller ends thereof, the several rods converging as they extend into the container and being connected to each other at a distance from the plugs,

the rods having offsets therein adjacent their connection to the plugs to provide stops limiting the outward movement of the plugs to maintain the inner ends of said plugs in said openings at the limit of their outward movement.

2,409,119
METHOD OF ELECTROPLATING NICKEL AND COBALT, BATHS AND AGENTS THEREFOR
Meyer L. Freed, Ansonia, Conn., assignor to The Seymour Manufacturing Co., Seymour, Conn.
No Drawing. Application April 28, 1939, Serial No. 270,513
34 Claims. (Cl. 204—49)

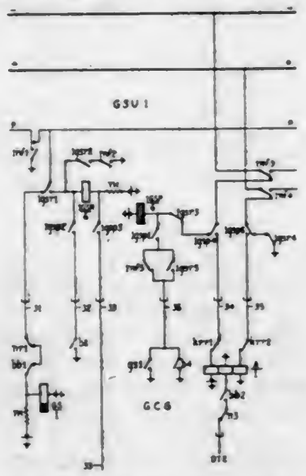
1. An aqueous, acid electroplating bath which comprises in the aqueous medium a metal-ion yielding material consisting essentially of a mixture of the sulfate and of the chloride of one of the metals selected from the group consisting of nickel and cobalt, together with an amount of a sulfonated aryl aldehyde sufficient to permit a brilliant cathodic deposit of the metal to be obtained upon the passage of an electric current from an anode comprising said metal through the bath to a cathode, under the operating conditions.



2,409,120
PRODUCTION OF BRIGHT METALLIC DEPOSITS
Meyer L. Freed, Ansonia, and Oscar A. Stocker, New Haven, Conn., assignors to The Seymour Manufacturing Co., Seymour, Conn.
No Drawing. Application April 15, 1940, Serial No. 329,724
27 Claims. (Cl. 204—49)

1. An aqueous electroplating bath for producing by electrodeposition under acid conditions a brilliant, cathodic deposit of nickel, which bath comprises in addition to nickel ion yielding material selected from nickel sulfate, nickel chloride, and a mixture of nickel sulfate and nickel chloride, a thiourea as the brightening agent and in a concentration less than about one and one-half grams per liter but in a quantity sufficient to permit a brilliant deposit of nickel of unusually satisfactory hiding power to be obtained under the operating conditions.

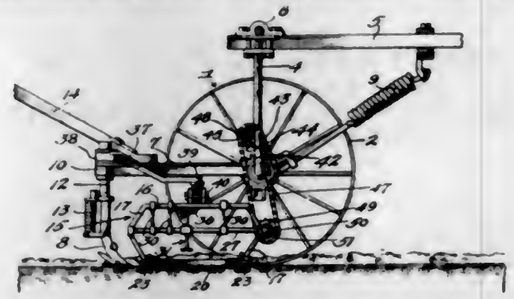
2,409,121
DUMPING MECHANISM FOR MOLDS
Arthur Fritschle, University City, Mo., assignor to American Smelting and Refining Company, New York, N. Y., a corporation of New Jersey
Application April 29, 1943, Serial No. 484,968
5 Claims. (Cl. 22—91)



1. In a self-dumping mold, a frame, an open-top ingot mold adapted to rest on said frame in pouring position, hinge means connecting the rear of said mold and said frame, an anvil in back of said mold to engage the mold when it is

swung to dumping position, operating mechanism for moving said mold between pouring and dumping positions, a shaft passing through the

front of said mold, semi-circular slotted roller guides concentric with said dumping hinge, and rollers in said guides disposed on said shaft.

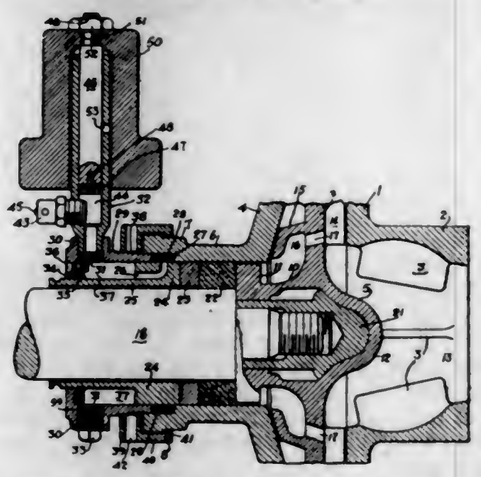


2,409,122
CROSSBAR SELECTOR SWITCHING UNIT
Charles Gillings and Lawrence John Murray, Liverpool, England, assignors to Automatic Electric Laboratories, Inc., Chicago, Ill., a corporation of Delaware
Application December 4, 1943, Serial No. 512,888
In Great Britain January 8, 1943
8 Claims. (Cl. 179—22)

1. In a switching system, a plurality of groups of lines, a numerical switch, means for operating said switch directively to select any one of said groups, a crossbar switch thereupon operated by said numerical switch to complete connections simultaneously to all of the lines of the selected group, means for testing the lines of the selected group successively over the connections completed to the respective ones of said lines by said crossbar switch, and means operated responsive to said testing means finding a line having a predetermined condition on it for causing said crossbar switch to interrupt all of said connections except the one completed to the line having such condition on it.

2,409,123
COMBINATION CULTIVATOR AND ROW THINNER
Russell L. Harral, Jonesboro, Ark.
Application April 5, 1945, Serial No. 586,692
5 Claims. (Cl. 97—12)

1. The combination with a wheel-supported straddle-row cultivator including a pair of trailing shovel-carrying beams, of a skid frame intermediate said beams for straddling a row being cultivated and adapted to travel over the ground, ground-engaging skids on said frame for supporting the same, a combined row-thinning and hoeing element mounted in said frame to travel over



the row and be revolved crosswise of the row, means to revolve said element operative by a wheel of the cultivator, and means to detachably attach said frame to one of said beams to travel in advance of the shovel carried by the beam.

2,409,124
PREPARATION OF ACRYLONITRILE
Ralph V. Heuser, Glenbrook, Conn., assignor to American Cyanamid Company, New York, N. Y., a corporation of Maine
Application October 19, 1940, Serial No. 361,986
19 Claims. (Cl. 260—464)

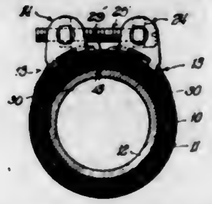
1. The process of preparing acrylonitrile which comprises reacting acetylene and hydrocyanic acid in an aqueous solution of a cuprous halide as a catalyst at a temperature within the range of 60° to 110° C.

2,409,125
SHAFT SEAL
Oystein Jacobsen, Montgomery County, Ohio, assignor to The Duriron Company, Inc., Dayton, Ohio, a corporation of New York
Application June 24, 1944, Serial No. 541,860
3 Claims. (Cl. 286—9)

1. A seal for a fluid pressure pump having a casing, a pump shaft and an impeller connected thereto, said impeller being provided with a thrust collar, said seal comprising a sealing ring mounted about the shaft and in abutting relation to the thrust collar, and means for applying a continuous pressure to said sealing ring, said means including a pressure block mounted on said shaft and having a reduced sleeve portion, a gland surrounding said sleeve and providing with said sleeve a pressure chamber for receiving hydraulic fluid, whereby sealing pressure is applied to said sealing ring.

2,409,126
SYNTHETIC NITROGENOUS RESINS AND INTERMEDIATES THEREFOR
William O. Kenyon and Delbert D. Reynolds, Rochester, N. Y., assignors to Eastman Kodak Company, Rochester, N. Y., a corporation of New Jersey
No Drawing. Application March 20, 1943, Serial No. 479,304
2 Claims. (Cl. 260—83)

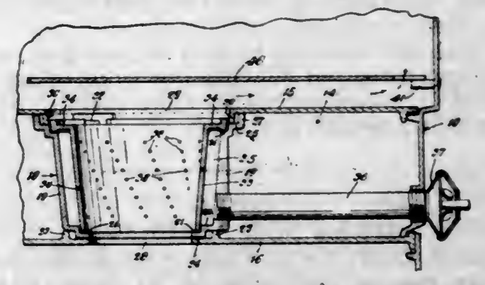
2. Polymerized N-(α-methacrylyl)-dl-α-aminophenyl acetic acid ethyl ester.



2,409,127
QUINONYLAMINO-N-ALKYLENESULFONIC ACIDS AS PRINTING AIDS
Roy Herman Kienle and Chester Albert Amick, Bound Brook, N. J., assignors to American Cyanamid Company, New York, N. Y., a corporation of Maine
No Drawing. Application July 1, 1943, Serial No. 493,138
8 Claims. (Cl. 8—70)

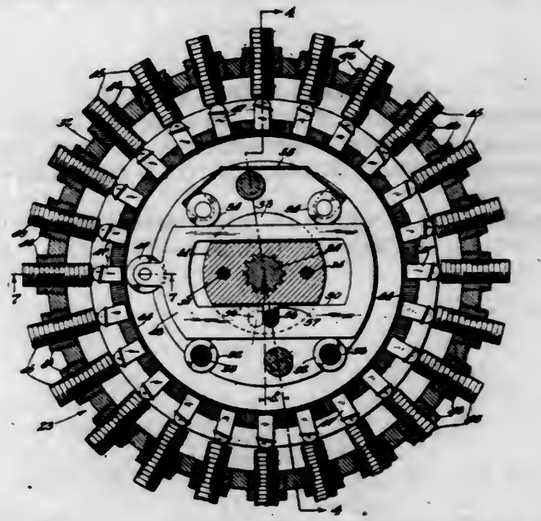
1. A color composition comprising a vat dye and a printing assistant having the type formula

$$Q—(NH—Alk—SO_3—X)_n$$



in which Q represents an anthraquinonyl radical, Alk represents a short chain alkylene radical, X represents a radical selected from the group consisting of hydrogen and the monovalent alkali radicals and n represents a small whole number selected from the group consisting of one and two.

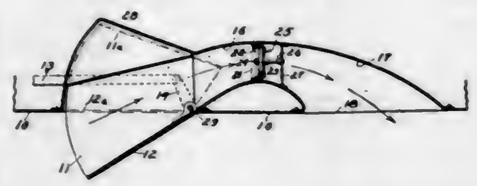
2,409,128
BANDING MEANS
Rudolf G. Krasberg, Chicago, Ill.
Application February 25, 1944, Serial No. 523,786
5 Claims. (Cl. 24—19)



1. A clamp, which comprises a banding element adapted substantially to encompass an object to be clamped thereby with end portions terminating in loops, and U-shaped locking members constituting spaced apart substantially parallel upstanding wall members integrally connected to each other by bridging pieces underlying the wall members and providing an apertured base for each of said locking members, one of said bridging pieces on each locking member having its lower surface lying in a plane below said other bridging piece on its locking member with said banding element in the area of each loop secured between said walls of said locking members and carried by each of said loops, each of said locking members having a cross-head swivelly mounted and connected by a bolt adapted to draw said cross-heads together and to constrict the banding element, said bolt being screw-threaded and one of said cross-heads constituting a nut for said bolt having trunnions journaled in said side walls, each of said locking members overlying an inner portion of its loop and being pressed thereagainst by the remaining overlying portion of the loop to press said inner portion and said locking member into frictional engagement with said object to be clamped.

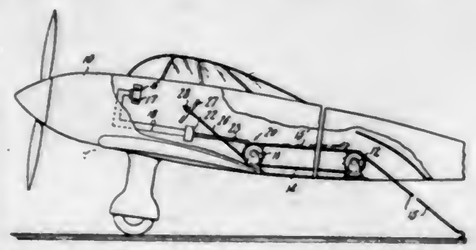
2,409,129
GAS BURNER
Henry Lange, Quincy, Ill., assignor to The Quincy Stove Manufacturing Company, Quincy, Ill., a corporation of Illinois
Application September 16, 1943, Serial No. 502,583
7 Claims. (Cl. 126—36)

1. In combination with spaced horizontal walls of an oven gas flue provided with vertically aligned openings therein a gas burner positioned between said horizontal walls, said burner comprising an outer tubular member extending between said walls and provided with means at the upper and lower ends thereof providing gas-tight seals with said walls at the margins of said openings, an inner tubular member positioned within said outer member, said inner member defining therein a central combustion chamber substantially equal in length to the distance between said walls and being open at the upper and lower ends for permitting flow of air upwardly through the chamber, said tubular members having upper and lower contacting portions providing gas seals therebetween and being spaced apart intermediate said contacting portions to provide an annular gas distributing passage therebetween, and a plurality of gas ports in said inner member for jetting gas from said passage into the stream of air in said chamber for combustion therein.



2,409,130
RADIO AZIMUTH COMPENSATOR
William P. Lear, Piqua, Ohio, assignor, by mesne assignments, to Lear, Incorporated, Grand Rapids, Mich., a corporation of Illinois
Application October 31, 1942, Serial No. 464,016
15 Claims. (Cl. 250—11)

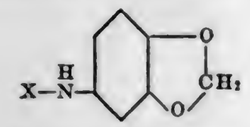
1. In a bearing compensator, a rotatable shaft, a corrector arm in engagement with said shaft whereby said arm and shaft are rotated together, said arm being movable radially in a plane including said shaft, a flexible member in engagement with said arm to position said arm radially relative to said shaft, a plurality of displaceable



units individually gripping said flexible member at spaced intervals for establishing a predetermined compensator cam surface, an output disk engaged with said corrector arm for transmitting compensated angular positions by said output disk in correspondence with the shaft positions, a first annular dial attached to said shaft for indicating the shaft orientation, and a second annular dial arranged concentrically about said front dial and secured to said output disk, whereby the compensated bearing positions of said output disk are indicated by said second dial for each reading of said first dial.

2,409,131
SIREN FOR AIRCRAFT
William P. Lear, North Hollywood, Calif., assignor, by mesne assignments, to Lear, Incorporated, Grand Rapids, Mich., a corporation of Illinois
Original application February 21, 1942, Serial No. 431,814. Divided and this application August 24, 1943, Serial No. 499,755
4 Claims. (Cl. 244—1)

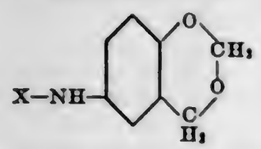
1. The combination with an aircraft of sirens fixedly mounted within the fuselage of the aircraft; an air duct surrounding each of said sirens and extending on either end to air intake and air outlet openings in the fuselage, each of said ducts converging from each end toward its center; said sirens being supported at substantially the narrowest cross-sectional region in said ducts; air scooping means attached to said fuselage at said intake openings; said air scoop means each having a fuselage section secured thereto and conforming with the surface contour of the fuselage when said scoop means is retracted; and said ducts being formed with receptacle portions receiving said scoop means in the retracted position.



2,409,132
REELING MECHANISM
William P. Lear, North Hollywood, Calif., assignor, by mesne assignments, to Lear, Incorporated, Grand Rapids, Mich., a corporation of Illinois
Application October 19, 1943, Serial No. 506,796
9 Claims. (Cl. 244—110)

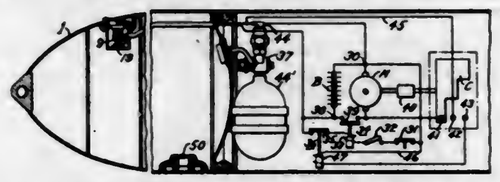
9. In combination, an aircraft having a fuselage; a landing hook adapted to be extended from and retracted into said fuselage; a first sprocket located adjacent the mid-section of said fuselage; a second sprocket located adjacent the rear section of said fuselage; an endless chain engaging said sprockets; an electric motor; reduction gearing connected to said one sprocket; planetary gearing, said planetary gearing including an element coupled to said reduction gearing, a movable mounting plate and an element adapted to be coupled to said electric motor; means effective upon energization of said electric motor to connect said motor to said last named element; a pair of switches interposed in the circuit of said electric motor; an actuating member disposed in operative relation with said switches, said actuating member being operable by said mounting plate to selectively open said switches to deenergize said electric motor when the torque of said motor exceeds a preselected value; means normally restraining movement of said mounting plate and said actuating member; a reel; a bracket supporting said reel; a cable secured to said reel to rotate the same in one direction; a grip secured to said cable; means urging said reel to rotate in the opposite direction to rewind said cable thereon; a ratchet secured to said first sprocket; a pawl mounted on said reel adjacent said ratchet; means urging said pawl into engagement with said ratchet to interconnect said reel and said one sprocket; and a cam secured to said bracket and adapted to engage said pawl to disengage the same from said ratchet.

2,409,133
N-SUBSTITUTED DERIVATIVES OF 5-AMINO-1,3-BENZODIOXOLES
Hans Z. Lecher, Plainfield, and John P. Goulding, Neshanic Station, N. J., assignors to American Cyanamid Company, New York, N. Y., a corporation of Maine
No Drawing. Application December 10, 1943, Serial No. 513,735
3 Claims. (Cl. 260—338)



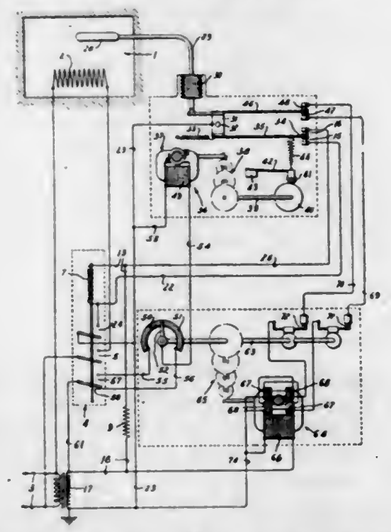
1. Chemical compounds selected from the group consisting of derivatives of 5-amino-1,3-benzodioxole represented by the formula

in which X represents a mononuclear para-amino-phenyl radical and the salts of said compounds.



2,409,134
DERIVATIVES OF 6-AMINO-1,3-BENZODIOXAN
Hans Z. Lecher, Plainfield, John P. Goulding, Neshanic Station, and Robert P. Parker, Somerville, N. J., assignors to American Cyanamid Company, New York, N. Y., a corporation of Maine
No Drawing. Application December 10, 1943, Serial No. 513,733
5 Claims. (Cl. 260—338)

1. Chemical compounds selected from the group consisting of compounds represented by the formula

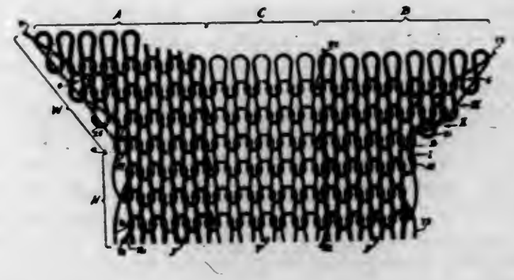


in which X represents a mononuclear para-aminophenyl radical, and the salts of said compounds.

2,409,135
BUOYANCY CONTROL SYSTEM
Merrill G. Leonard, Sharon, Pa., assignor to Westinghouse Electric Corporation, East Pittsburgh, Pa., a corporation of Pennsylvania
Application August 5, 1944, Serial No. 548,279
10 Claims. (Cl. 114—20)

1. For the control of the exercise head of a torpedo which is filled with a ballast liquid, as water, to balance the torpedo and to give it a predetermined negative buoyancy and which exercise head is associated with a source of gas under relatively high pressure for expelling the ballast liquid from the torpedo exercise head, in combination, a source of electric energy, electrically actuated buoyancy control means for connecting, the gas pressure of the source of relatively high pressure, to the interior of the exercise head to cause the expulsion of the ballast liquid from the exercise head, electrically actuated timing means set in operation by the firing of the torpedo for causing the operation of the buoyancy control means a predetermined time after firing of the torpedo, switching means for causing the operation of said buoyancy control means independent of the timing means, and means responsive to both the pressure of the water outside of the torpedo and the speed of the torpedo with reference to the water outside of the torpedo for causing the operation of said switching means.

2,409,136
CONDITION CONTROL
Edgar D. Lilja, Rockford, Ill., assignor to Barber-Colman Company, Rockford, Ill., a corporation of Illinois
Application September 22, 1941, Serial No. 411,893
6 Claims. (Cl. 236—46)

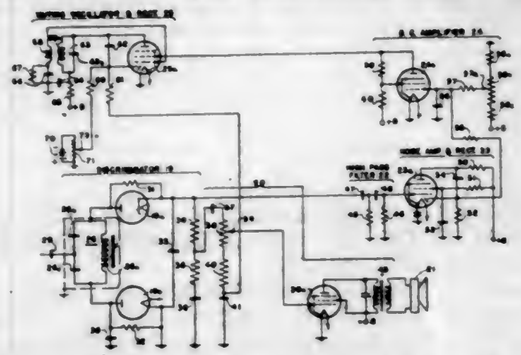


1. The combination of a condition-responsive instrument having a variably adjustable control point, mechanism including an electric timing motor operating continuously to raise and lower said control point alternately through a fixed range, voltage regulating means governing the speed of operation of said motor during the raising and lowering periods, a reversible motor operable to actuate said voltage regulating means and decrease or increase the voltage applied to said timing motor according to the direction of operation of the reversible motor, and means responsive to deviations of said condition from a predetermined desired value to determine the direction and extent of operation of said reversible motor.

2,409,137
PROCESS OF SEPARATING TALL OIL INTO FRACTIONS BY TREATMENT WITH LEVULINIC ACID ESTER
Kermit D. Longley, Philadelphia, Pa., assignor to Quaker Chemical Products Corp., Conshohocken, Pa., a corporation of Pennsylvania
No Drawing. Application December 26, 1944, Serial No. 569,907
2 Claims. (Cl. 260—97.5)

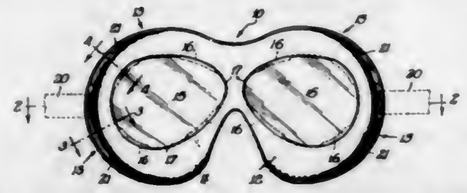
1. The process of separating tall oil into useful fractions which comprises mixing tall oil with a liquid ester of levulinic acid to form an apparently homogeneous solution, allowing the solution to stand at approximately normal room temperature until a waxy solid precipitates, separating the precipitate from the supernatant and cooling the supernatant to substantially below room temperature whereby a fraction consisting largely of fatty acids precipitates.

2,409,138
HOSIERY
Sterling C. Mack, Bangor, Pa., assignor to Julius Kayser & Co., Brooklyn, N. Y.
Application July 9, 1942, Serial No. 450,330
18 Claims. (Cl. 66—187)



1. A flat knitted fabric comprising series of courses, the courses in each series being knitted from separate but identical yarns, certain of said courses having a pair of needle loops and an intermediate sinker loop added thereonto, the portions of the several yarns incorporated in the courses of one series and floating from the selvage thereof passing through such a sinker loop added onto courses of subsequent series.

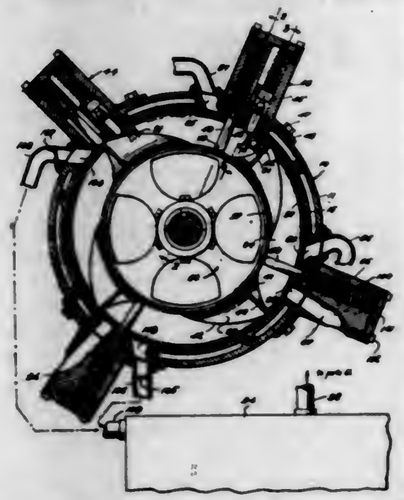
2,409,139
RADIO RECEIVING SYSTEM
Henry Magnuski, Chicago, Ill., assignor to Galvin Manufacturing Corporation, Chicago, Ill., a corporation of Illinois
Application July 3, 1943, Serial No. 493,322
16 Claims. (Cl. 250—20)



1. In a wave signal receiving system which includes a signal responsive device, means responsive solely to undesired noise signals appearing in said system in the absence of a received desired signal for developing a control voltage, means responsive to a received desired signal in the presence of noise signals for changing said voltage, an oscillator, means responsive to said voltage

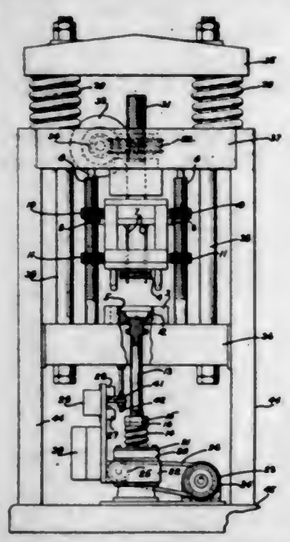
for controlling an electrical characteristic of the output of said oscillator, and means controlled by

said oscillator output for determining the responsiveness of said device.



2,409,140
INDUSTRIAL EYESHIELD
Robert L. Malcom, Chicago, Ill., assignor to Chicago Eye Shield Company, Chicago, Ill., a corporation of Illinois
Application April 29, 1944, Serial No. 533,305
3 Claims. (Cl. 2—14)

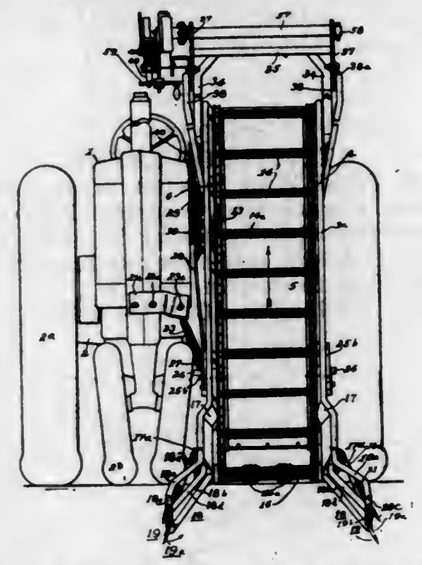
1. An industrial eye shield, which comprises a resilient plastic frame, said frame having a frontal section with lens-receiving openings therein, said frontal section, around each lens-receiving opening, having a plurality of spaced apart inner ledges extending generally toward each other on the inside of the frame and adapted to support a lens in each opening along marginal portions of an inner surface of each lens, said frontal section, around each lens-receiving opening, also having a plurality of spaced apart outer projections extending generally toward each other on the outside of the frame, said outer projections overlying the spaces between said inner ledges and adapted to maintain the lens in locked position in each opening and in abutting relation against said inner ledges by pressing against marginal portions of the opposite surface of each lens after an edge of a lens is inserted in each opening between said ledges and said projections and the frame is flexed so that the lens can be sprung into the opening and positioned therein.



2,409,141
ROTARY INTERNAL-COMBUSTION ENGINE
Louis Margolis, Washington, D. C., assignor of five per cent to Eugene Berger, Washington, D. C.
Application August 30, 1944, Serial No. 551,877
1 Claim. (Cl. 123—14)

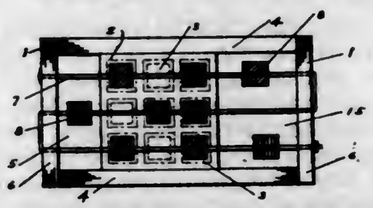
A rotary internal combustion engine comprising a substantially toroidal cylinder, a rotor including a plurality of circumferentially spaced apart pistons movable in said cylinder, a housing extending radially from and secured to said cylinder, an abutment slidably carried by said housing and normally biased to a position across said cylinder, each piston including a cam-shaped leading portion engageable with said abutment for moving the latter outwardly into said housing, a fuel intake valve carried by said housing, and means connected to said valve and projecting into said cylinder in a position for engagement with said cam-shaped leading portion for moving said valve to open position, said latter means including a bell crank pivotally carried

by said housing and having an elongated slot in one arm thereof, a pin carried by said valve loosely engaging in said slot, a second pin slidable through said cylinder, and means rockably connecting said second pin to the other arm of said bell crank.



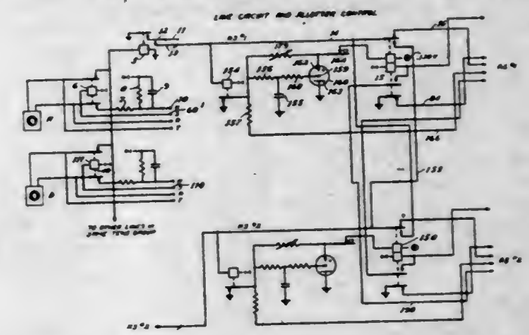
2,409,142
MOLDING APPARATUS
Clarence E. McCoy, Western Springs, Ill., assignor to Western Electric Company, Incorporated, New York, N. Y., a corporation of New York
Application February 11, 1942, Serial No. 430,391
5 Claims. (Cl. 18—16)

1. An apparatus for compression molding a threaded article including a sectional mold, a rotatable, threaded mold core, means for clamping the sections of said mold together to close said mold, means for moving said mold, a motor for rotating said core, a current supply for said motor, a magnetic switch for controlling the energization of said motor, a double pole relay associated with said magnetic switch for controlling the energization of said magnetic switch, a normally closed single contact switch connected to said current supply, said switch being operable to deenergize said relay a double contact switch normally biased to complete a circuit from said single contact switch to said magnetic switch



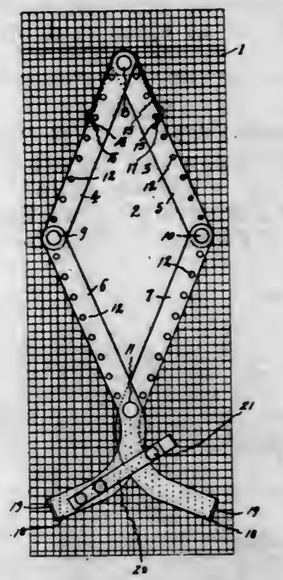
but movable to open said circuit and to energize said relay, a holding circuit completed by the energizing of said relay when said single contact switch is closed for holding said relay closed as said double contact switch returns to its normal biased position, a second circuit prepared by the energizing of said relay, said second circuit connecting the magnetic switch to the double contact switch, and means operable in response to the movement of said mold for alternately actuating said single contact switch and said double contact switch.

2,409,143
LOADER
Eric M. McElhinney and James A. Podhajsky, Tama County, Iowa
Application May 14, 1942, Serial No. 442,902
19 Claims. (Cl. 198—13)



1. In combination with a wheeled structure having a pair of traction wheels mounted on an axle support, a conveyer comprising a basal body inclined downwardly toward its forward end and having its rear portion carried by and adjustably mounted above said axle support and its forward portion adjustably mounted for up and down movement on said wheeled structure forwardly of said axle support, an endless conveyer mounted on said basal body and having its upper course traveling rearwardly and upwardly, the forward end of said basal body being provided with forwardly extending and laterally inclined gathering arms having gathering fingers rockable inwardly toward each other against a normal bias, and driving means for connecting said endless conveyer to a power source.

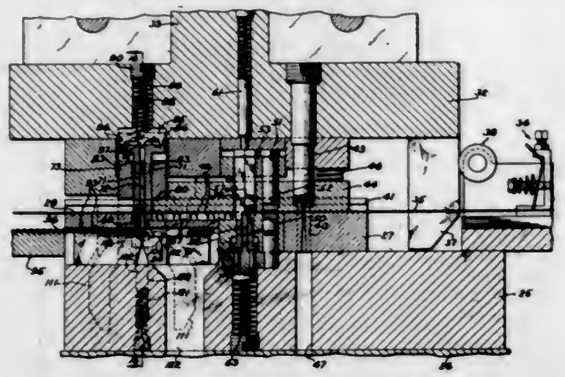
2,409,144
GAME
Gillis A. Mills, Pikesville, Md.
Application December 1, 1944, Serial No. 566,095
2 Claims. (Cl. 273—130)



2. A game device of the class described comprising a support, a playing board mounted in said support to create open spaces at each end, playing cubes for movement over the face of said board, and means for supporting the playing cubes on the face of said playing board.

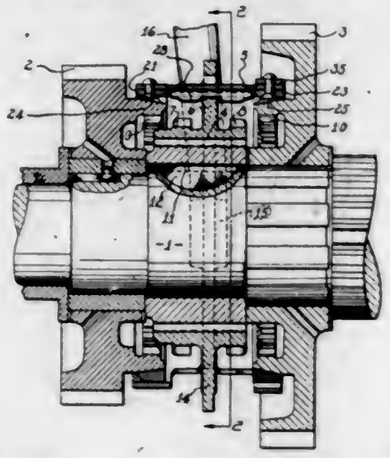
2,409,145
CONTROL AND TRIGGER CIRCUIT FOR TELEPHONE SYSTEMS AND THE LIKE
Frank A. Morris, Rochester, N. Y., assignor to Stromberg-Carlson Company, Rochester, N. Y., a corporation of New York
Application September 26, 1944, Serial No. 555,850
20 Claims. (Cl. 179—175.2)

1. The method of initiating electrical conduction through an arc discharge device having an anode, a cathode and a starter electrode, said cathode and said anode being connected in series with a source of unidirectional electrical energy, which method comprises accumulating an electrostatic charge from a relative low voltage source, discharging said charge, utilizing said discharge to develop a voltage of a higher order, applying said higher voltage to the starter electrode to cause a discharge in said device.



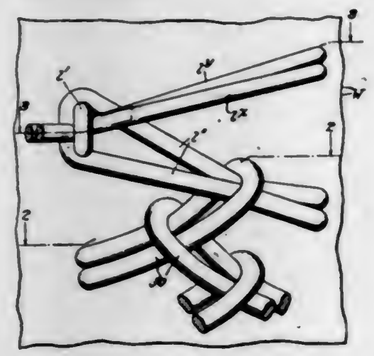
2,409,146
SHUTTER FOR FISHING NETS
John Motel, Cleveland, Ohio
Application July 11, 1945, Serial No. 604,435
1 Claim. (Cl. 43—7)

In or for a fishing-net, a shutter apparatus comprising the combination of a plurality of articulated links normally held in closed position, manually operated means having a normally inactive position connected to and movable with one of the aforesaid articulated links and adapted to release the links, when manually manipulated,



to produce an opening in the fishing-net, and means cooperating with the links to hold the links in closed position when the manually operated inactive means is returned to its initial position.

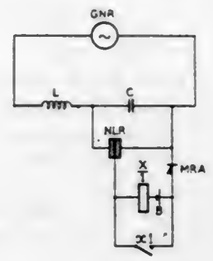
2,409,147
APPARATUS FOR FORMING AND ASSEMBLING ARTICLES
Elmer C. Neuhaus, Chicago, and Charles W. Verrill, Hinsdale, Ill., assignors to Western Electric Company, Incorporated, New York, N. Y., a corporation of New York
Application July 20, 1943, Serial No. 495,472
5 Claims. (Cl. 153—1)



1. In an assembling apparatus, a fixed cutting die, a movable cutting member cooperating with said cutting die for severing a blank from a strip of material, a pair of transfer jaws yieldably carried by said cutting member and projecting in advance of said cutting member and normally movable therewith for receiving said severed blank and transferring said severed blank to a predetermined position, resilient means for maintaining said transfer jaws in said normal advanced relation to said cutting member, means for actuating said cutting member to sever said blank from said strip and carry said blank to said predetermined position, and means for arresting the movement of the transfer jaws adjacent said predetermined position to cause a relative movement between said jaws and said cutting member to eject said blank.

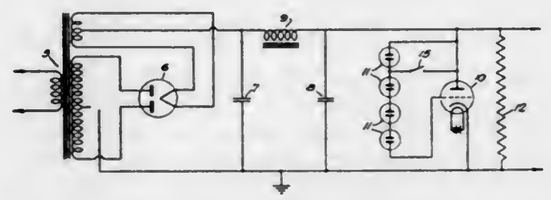
2,409,148
SYNCHRONIZING CLUTCH CONSTRUCTION
Carl D. Peterson and Robert R. Burkhalter, Toledo, Ohio
Application January 20, 1945, Serial No. 573,731
6 Claims. (Cl. 192—53)

1. In a synchronizing clutch of the type shiftable in opposite directions from neutral to connect together driving and driven elements through different speed ratios, including two members, one being a toothed member rotatable with and shiftable axially of one of said elements into and out of clutching engagement and having an annular peripheral flange, the flange being formed with arcuate slots extending through the opposite faces thereof, and a friction member including a sleeve having lengthwise slots extending through the arcuate slots of the flange, the portions between the lengthwise slots being formed to coact at their side edges with the end walls of the arcuate slots to block relative shifting movement except when the speeds of the driving and driven elements approach synchronization, internal bands at opposite ends of the sleeve, and a bow spring extending lengthwise of each of said portions and having its apex portion provided with spaced apart bosses providing a depression arranged astride the inner wall of the arcuate slot, with the bosses on opposite sides of the flange in an axial direction, the spring thrusting at its ends against the bands.



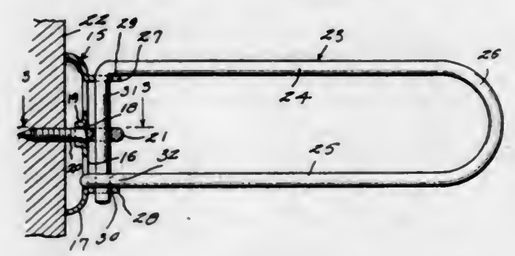
2,409,149
STITCH FORMATION
Joseph H. Pikul, West Newton, Mass., assignor to The Reece Corporation, a corporation of Maine
Original application February 21, 1944, Serial No. 523,173. Divided and this application September 11, 1944, Serial No. 553,527
4 Claims. (Cl. 112—262)

1. A tying stitch for chain sewing in which the last-formed loop of the thread extends through the work and between the legs of the next to the last-formed loop, and, after emerging from the work, the free end of the thread passes first over one leg of the next to the last loop and then through the last loop, said last loop being drawn tight and pulling the free end against the next to the last loop and the work.



2,409,150
ELECTRICAL CIRCUIT EMPLOYING NON-LINEAR RESISTANCE MATERIAL
Thomas George Rice, Huyton, near Liverpool, England, assignor to Automatic Electric Laboratories Inc., Chicago, Ill., a corporation of Delaware
Application May 27, 1944, Serial No. 537,566
In Great Britain July 13, 1943
10 Claims. (Cl. 175—320)

1. In combination, a non-inductive non-linear electrical resistance device having a high resistance at low voltages and a low resistance at high voltages, a low voltage circuit connected across at least a portion of said resistance device, a high voltage circuit connected across said resistance device, and means for impressing a high voltage from said high voltage circuit across said resistance device, to cause a substantially increased



current flow in said low voltage circuit and said resistance device.

2,409,151
ELECTRICAL REGULATING DEVICE
Donald H. Rogers, Jersey City, N. J., assignor to Western Electric Company, Incorporated, New York, N. Y., a corporation of New York
Application February 2, 1943, Serial No. 474,477
6 Claims. (Cl. 171—312)

1. A voltage regulating device comprising a current supply circuit having impedance, a triode tube connected across said supply, and a neon tube connected between the grid and the plate of said tube.

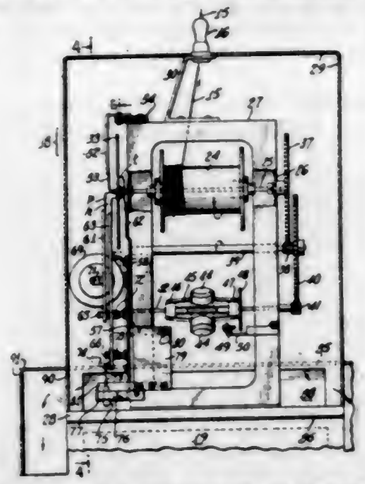
2,409,152
SWINGING BRACKET
Raymond R. Rundell, Miami, Fla.
Application June 13, 1944, Serial No. 540,079
4 Claims. (Cl. 248—289)

1. A swinging bracket comprising a base formed with an opening, a pair of ears extending from said base, an article supporting bracket including a pair of parallel arms, an integral connecting member connecting the outer ends of said arms together, a stub shaft integral with the inner end of one of said arms and pivotally engaging through one of said ears, a second stub shaft integral with the inner end of the other of said arms and pivotally engaging through the other of said ears and aligning with said first stub shaft, a sleeve telescoping said shafts between said ears, means fixedly securing said sleeve to at least one stub shaft, and an eye screw having the shank thereof extended through said opening and the eye thereof engaging about said sleeve.

2,409,153
PROCESSING APPARATUS
Harold D. Russell and John I. Crabtree, Rochester, N. Y., assignors to Eastman Kodak Company, Rochester, N. Y., a corporation of New Jersey
Application November 30, 1943, Serial No. 512,348
8 Claims. (Cl. 95—94)

1. A fluid treating compartment for a machine for processing strip material comprising bottom, side and end walls, one of said end walls constituting a first end wall and the other of the end walls constituting a second end wall, a pair of resilient rollers, one mounted adjacent the first end wall and the other mounted adjacent the second end wall, both of said rollers pressing toward the bottom wall, power means for turning the roller adjacent the first end wall in a counter-clockwise direction and for turning the roller adjacent the second end wall in a clockwise direction, a sponge means movably mounted between the rollers and driven by said power means for turning the rollers for carrying a quantity of fluid into contact with a strip of film stretched between the rollers, said fluid being confined to the film between the rollers by the pressure of the resilient rollers against said film and towards the bottom of the treating compartment.

2,409,154
FISHING REEL
John V. Schafer, Bronson, Mich.
Application August 6, 1943, Serial No. 497,570
7 Claims. (Cl. 242—84.5)



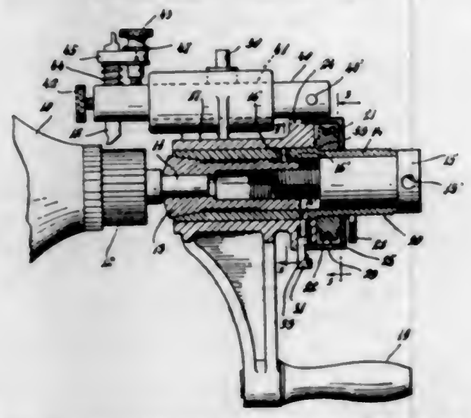
2. A reel comprising, a frame including an end member, a spool rotatably mounted in said frame, a drive shaft journalled in said end member, a gear member carried by said shaft, a recess provided in one of said members, an element having a relatively large braking surface disposed in said recess between said members, and means bearing on the shaft for urging the gear in a direction to cause the element to effect a braking action upon the gear.

2,409,155
RADIO TRANSMISSION APPARATUS
Eugene L. Schellens, Essex, and Norman E. Gibbs, Old Lyme, Conn., assignors to The R. W. Cramer Company, Incorporated, Centerbrook, Conn., a corporation of Connecticut
Application September 4, 1942, Serial No. 457,268
6 Claims. (Cl. 177—380)

1. In a balloon-elevated radiometeorograph, in combination, a suspension cord below the balloon, a telemeter, a suspended housing closed at top and sides and enclosing the telemeter, and for driving the telemeter a gravity motor comprising a drum from which said cord unwinds by the relative descent of the telemeter, and a radio-signal transmitter operated by the telemeter; the suspended housing enclosing the telemeter having at the top wall thereof an exit guide for the

relatively ascending drive cord, comprising a rubbery nipple member through which the cord slides

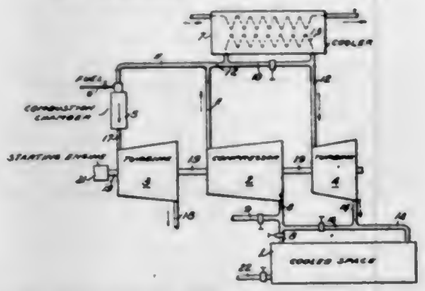
and which excludes entrance of water from the cord into the telemeter.



2,409,156
FUEL COMPOSITION
Walter A. Schulze and Richard C. Alden, Bartlesville, Okla., assignors to Phillips Petroleum Company, a corporation of Delaware
No Drawing. Application March 28, 1942, Serial No. 436,714
4 Claims. (Cl. 44—80)

1. An improved method of operating an aviation gasoline engine requiring a fuel having an octane number of at least about 100, which consists of supplying to said engine as the fuel during an operating period a gasoline comprising essentially a mixture of isoparaffin hydrocarbons having five, six, seven, eight and nine carbon atoms per molecule and about 10 per cent by volume of isopropyl benzene and at least about 3 ml. of tetraethyl lead fluid per gallon, said hydrocarbons being so proportioned that said mixture has gasoline characteristics of distillation range and contains isopentane in an amount not more than is sufficient to result in a Reid vapor pressure not greater than seven pounds, and maintaining during said operating period for said aviation engine rich-mixture operating conditions such that the fuel-air ratio is at least about .09.

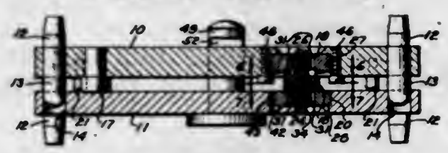
2,409,157
FUEL COMPOSITION
Walter A. Schulze and Richard C. Alden, Bartlesville, Okla., assignors to Phillips Petroleum Company, a corporation of Delaware
No Drawing. Application March 28, 1942, Serial No. 436,715
7 Claims. (Cl. 44—80)



1. An improved method of operating an aviation gasoline engine requiring a fuel having an octane number of at least about 100, which consists of supplying to said engine as the fuel during an operating period a gasoline comprising essentially a mixture of isoparaffin hydrocarbons having five, six, seven, eight and nine carbon atoms per molecule and between about 2 and about 7% by volume of a mono-butylbenzene other than normal butylbenzene and at least about 3 ml. of tetraethyl lead fluid per gallon, said hydrocarbons being so proportioned that said mixture has gasoline characteristics of distillation range and contains isopentane in an amount not more than is sufficient to result in a Reid vapor pressure not greater than seven pounds, and maintaining during said operating period for said aviation enigine rich-mixture operating conditions such that the fuel-air ratio is at least about .09.

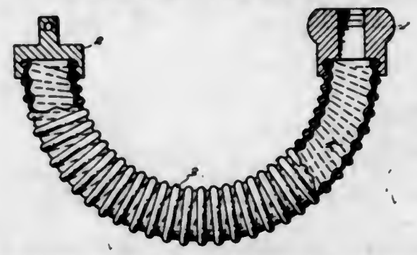
2,409,158
APPARATUS FOR TRIMMING COMMUTATORS
John Simpson, Jr., and James Williams, North Tiverton, R. I.; said Williams assignor to said Simpson, Jr.
Application December 30, 1944, Serial No. 570,570
3 Claims. (Cl. 82—4)

1. A commutator trimmer including a collet and a draw-in screw, a sleeve embracing said collet and screw and having a recess, a cutter carrier rotatable on said sleeve, an interlocking plunger pin mounted in the carrier and adapted to be inserted into said recess in said sleeve for interlocking the carrier to the sleeve, said pin having a notch in one side and a member carried by said cutter carrier and projecting into said notch to limit the movement of said pin.



2,409,159
ELASTIC FLUID CONDITIONING APPARATUS
Joseph L. Singleton, Wauwatosa, Wis., assignor to Allis-Chalmers Manufacturing Company, Milwaukee, Wis., a corporation of Delaware
Application August 26, 1944, Serial No. 551,370
14 Claims. (Cl. 257—9)

1. A self operative power unit for cooling and delivering large quantities of air or other combustion supporting elastic fluid into a fluid confining space comprising means for compressing a combustion supporting elastic fluid, a plurality of fluid expanding prime movers drivingly connected with said compressing means, fluid conductors severally connecting the inlets of said prime movers with the discharge of said compressing means, a fuel combusting means forming at least a part of one of said conductors and disposed in upstream relation with respect to the inlet of the prime mover connected thereto, means for cooling the fluid flowing through another one of said conductors prior to its entering the inlet of the prime mover connected thereto, and conduit

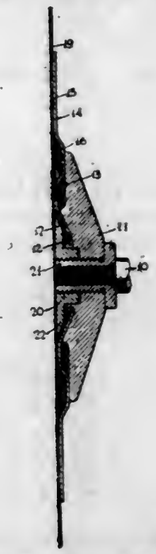


means connecting the exhaust of the prime mover receiving compressed fluid through another one of said conductors with a fluid confining space to be cooled.

2,409,160
WORK SUPPORT
Emil Sirp, Downers Grove, Ill., assignor to Western Electric Company, Incorporated, New York, N. Y., a corporation of New York
Application June 29, 1944, Serial No. 542,760
6 Claims. (Cl. 77—62)

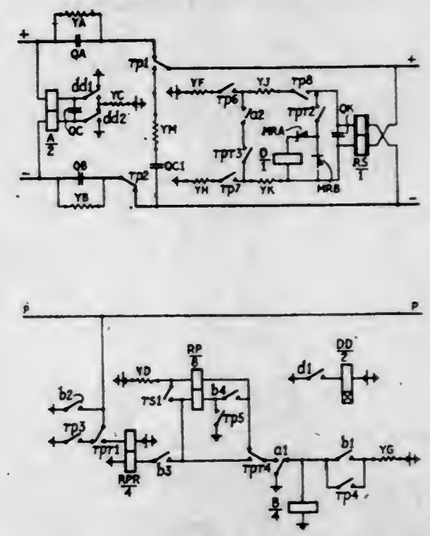
5. A work support and tool jig comprising a plate having an aperture, a work piece support freely rotatably mounted for limited rotation in said aperture and having a tool guiding aperture, means carried by said plate cooperating with a formation on said support for predeterminedly limiting the rotation of said support, and a member having peripheral formations engageable in alignable slots formed in central apertures in said support and the work piece to maintain said support and work piece in predetermined alignment.

2,409,161
BOURDON TUBE
Jens Sivertsen, Philadelphia, Pa.
Application February 22, 1943, Serial No. 476,744
3 Claims. (Cl. 73—418)



1. A Bourdon tube having a composite wall formed of a tube to seal the internal pressure and an encircling spring, the tube being within the spring and expanded outwardly between adjacent turns of the spring to form elastic bridge portions, whereby radial and axial strains on the Bourdon tube are substantially equalized and maximum tip travel is obtained.

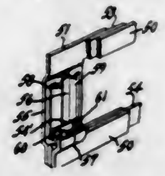
2,409,162
PHOTOGRAPHIC MATERIAL
Cyril J. Staud, Rochester, N. Y., assignor to Eastman Kodak Company, Rochester, N. Y., a corporation of New Jersey
Application April 15, 1942, Serial No. 439,007
1 Claim. (Cl. 95—8)



A photographic element comprising a rigid, opaque, non-frangible support, a layer of luminescent material thereon which emits green light when subjected to X-rays and a photographically sensitive layer insensitive to green light over said luminescent layer.

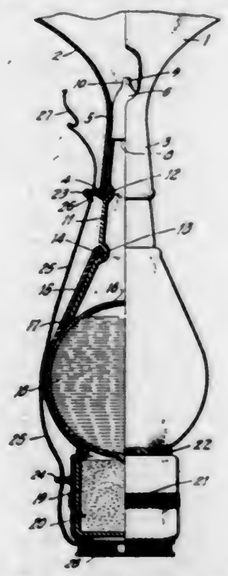
2,409,163
BACKING PAD FOR ABRASIVE DISKS
William Stever, Philadelphia, Pa., assignor to The Budd Company, Philadelphia, Pa., a corporation of Pennsylvania
Application September 15, 1943, Serial No. 502,423
6 Claims. (Cl. 51—197)

1. Flexible disk for supporting abrasive means, said disk consisting of sheet material and comprising a wide substantiallly flat annular marginal portion, an intermediate narrow annular portion forming a beading on one side and an open groove on the other side of the plane of said disk as defined by its said marginal portion and a central portion adapted for attachment to a supporting head, said beading and groove imparting to the disk added flexibility and reducing warping and breakage.



2,409,164
TELEPHONE SYSTEM
Reginald Taylor and George Thomas Baker, Liverpool, England, assignors to Automatic Electric Laboratories Inc., Chicago, Ill., a corporation of Delaware
Application September 25, 1943, Serial No. 503,750
In Great Britain November 10, 1942
10 Claims. (Cl. 179—18)

1. In a telephone system, two exchanges interconnected by a trunk line, means in one of said exchanges operated to seize said trunk line, means effective upon such seizure to condition said trunk

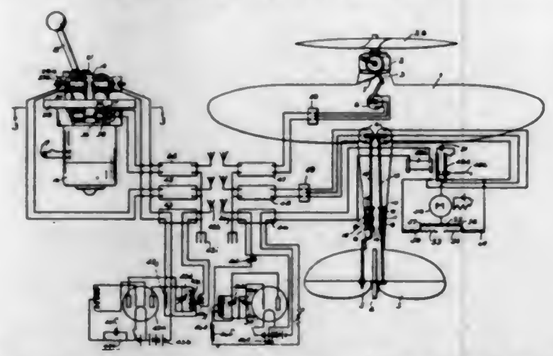


line for the transmission of impulses thereover, means in said one exchange operated to transmit impulses over said trunk line after it has been thus conditioned, means in the other of said exchanges associated with said trunk line for registering said impulses and controlling the extension of a connection in accordance therewith, and means thereafter controlled by said impulse registering means to alter the connections of said trunk line in said one exchange thereby to condition said trunk line for the transmission of speech thereover.

2,409,165
ELECTRON DISCHARGE DEVICE
Harry C. Thompson, Princeton, N. J., assignor to Radio Corporation of America, a corporation of Delaware
Application January 25, 1945, Serial No. 574,472
9 Claims. (Cl. 250—162)

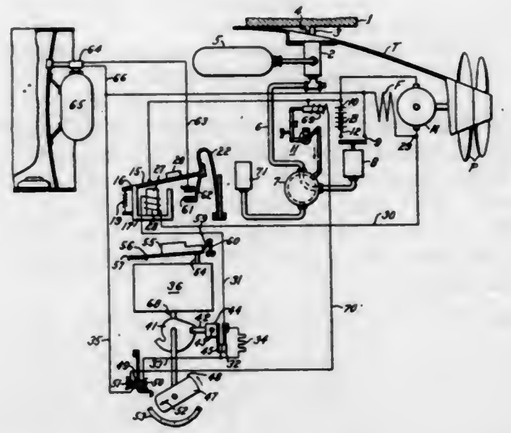
1. An electron discharge device having a cathode means for supplying electrons, and an electrode in the path of said electrons, and beam defining means positioned between said cathode means and said electrode and through which the path of the beam of electrons lies, said beam defining means including a pair of oppositely disposed conducting members spaced apart to provide a passageway therebetween, registering spring-like elements mounted on said conducting members and having ribs extending transversely of the beam path on opposite sides of the beam path, and extending toward each other to provide an aperture therebetween, and means at opposite edges of said spring-like elements for maintaining said ribs in spaced relationship for positively determining the aperture width.

2,409,166
SIGNAL DEVICE
John M. Tracy and Harold G. Veeder, Loudonville, N. Y.
Application January 17, 1944, Serial No. 518,672
4 Claims. (Cl. 244—33)



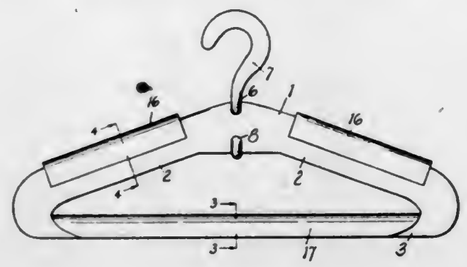
1. In a compact, portable signal device adapted to be carried by hunters for use in indicating their location when lost, the combination with a balloon bag formed of thin elastic material and having a restricted throat portion, of a hydrogen generator separate from said bag and comprising a gas-impervious casing of elastic material enclosing and closely engaging a hermetically sealed container having an acid therein, whereby said container may be broken by a blow on the outside of said casing, a metal in said casing adapted to react with said acid to generate hydrogen when said acid container is broken, and passage forming means providing communication between said generator and said balloon bag and frictionally engaged by the restricted throat portion of said bag for detachably connecting said balloon bag to said generator; whereby said bag, when inflated may be detached from said generator.

2,409,167
MOTOR FUELS
Preston L. Veltman, Port Arthur, Tex., assignor to Texaco Development Corporation, Jersey City, N. J., a corporation of Delaware
No Drawing. Application July 17, 1942, Serial No. 451,324
14 Claims. (Cl. 44—68)



1. A motor fuel comprising a hydrocarbon base fuel having dissolved therein a minor amount of an organo-metallic anti-knock agent comprising essentially a product obtained by heating together under pressure an unsaturated hydrocarbon and a carbonyl of a metal of atomic number 26 to 28.

2,409,168
DISTANT CONTROL
Nevilles E. Walker, Portland, Oreg.
Application October 15, 1941, Serial No. 415,109
10 Claims. (Cl. 172—282)

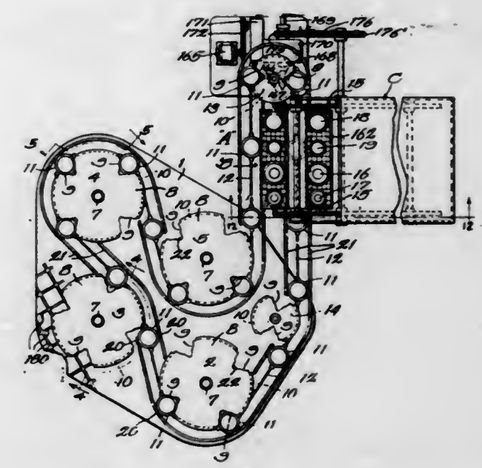


9. In combination with a mobile object a control including a reversible electric motor having reversible power circuits characterized by having a relay circuit receptive to and energized by interrupted electric impulses, thereby to make said control independent of the amplitude of said impulses, remote actuating apparatus including a motor driven make-and-break having an adjustable device for varying the duration and spacing of the electric impulses thereby to vary correspondingly the operation of said control, a clutch mechanism in said control adapted to be disengaged automatically when it is actuated past a fixed point and means for returning it to a neutral position, and inversely balanced resistance elements in electrical series with the power circuits leading to said motor, said resistance elements having movable contacts electrically connected therewith and physically joined to a rotatable member actuated by said motor and being operatively arranged to maintain said motor at any angular position to which it has been rotated.

2,409,169
CONTROL SYSTEM FOR EXHAUSTING BALLAST FROM TORPEDOES
Charles C. Whittaker, Pittsburgh, Pa., assignor to Westinghouse Electric Corporation, East Pittsburgh, Pa., a corporation of Pennsylvania
Application May 9, 1945, Serial No. 592,803
8 Claims. (Cl. 114—20)

1. In an electro-mechanical control system for controlling the buoyancy of an underwater craft normally having a negative buoyancy, in combination, a chamber containing a ballast liquid, a flask containing gas under pressure mounted on the craft for connection to the chamber containing the ballast liquid, means for establishing fluid communication between the chamber and flask, a pair of electric terminals normally energized at a substantially constant potential, means responsive to predetermined drop of said potential for operating said means for establishing fluid communication between the chamber and the flask to thus admit gas from the flask into the chamber containing the ballast liquid.

2,409,170
METHOD OF MAKING GARMENT HANGERS
Leonard A. Young, Detroit, Mich.
Application August 28, 1943, Serial No. 500,341
4 Claims. (Cl. 223—87)



1. The method of making garment hangers comprising the steps of applying adhesive to at least one of the surfaces of a plurality of plies of paper stock, superimposing the plies with the adhesive therebetween, stamping from such multi-ply material prior to the setting of the adhesive a blank comprising an integral yoke portion having downwardly diverging arm portions and a strut portion integrally connected with the lower ends of the arm portions, the upper edges of the arm portions having flap-like portions of substantial length extending therefrom, the upper edge of the strut portion having a flap-like portion extending therefrom, and conforming and folding the said flap portions of said arms and strut to provide relatively wide curved garment supporting edges and portions extending downwardly against the sides of the arms and strut from which they project prior to the setting of said adhesive between said plies to facilitate the conforming and folding of said flap portions, and retaining said flap portions as thus conformed and folded until said adhesive sets to facilitate permanent retention of the flap portions in the conformed and folded position, the central portion of the yoke being of substantially greater width than the arms of the yoke, and affixing a hook to said widened central portion.

2,409,171
MOTOR FUELS
Paul L. De Verter, Baytown, Tex., assignor to Standard Oil Development Company, a corporation of Delaware
No Drawing. Application December 3, 1943, Serial No. 512,781
7 Claims. (Cl. 44—69)

1. A motor fuel comprising a hydrocarbon mixture normally stable against gum formation and composed predominately of saturated aliphatic hydrocarbons and containing a small amount of a lead alkyl anti-knock agent which in the presence of said hydrocarbons tends during storage to form lead-containing precipitates and a hydroxy aromatic hydrocarbon of the class consisting of hydroquinone and quinhydrone in an amount sufficient to inhibit the formation of a lead-containing precipitate during storage.

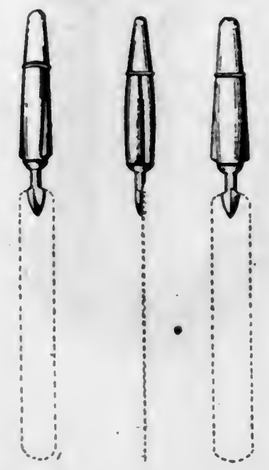
2,409,172
APPARATUS FOR THE MANUFACTURE OF POTTERYWARE
William J. Miller, Swissvale, Pa., assignor to Miller Pottery Engineering Company, Swissvale, Pa., a corporation of Pennsylvania
Application October 6, 1941, Serial No. 413,734
35 Claims. (Cl. 25—22)

1. In combination, a feeding means, preforming means and profiling means, carriers therefor and means for moving said carriers and means in orbital paths with uninterrupted forward movement, a pottery mold, a carrier therefor, means for moving said mold carrier and mold in another path with uninterrupted forward movement to bring the mold successively into registration with the feeding means and preforming means and

profiling means, means for causing said feeding, preforming and jiggering means to perform their designated functions whilst in registration with the mold.

2,409,173
PROCESS FOR PREPARING STABLE ROSIN ESTERS
Frederick J. Webb, Passaic, N. J., assignor to Ridbo Laboratories, Inc., Paterson, N. J., a corporation of New Jersey
No Drawing. Application November 11, 1943, Serial No. 509,901
11 Claims. (Cl. 260—104)

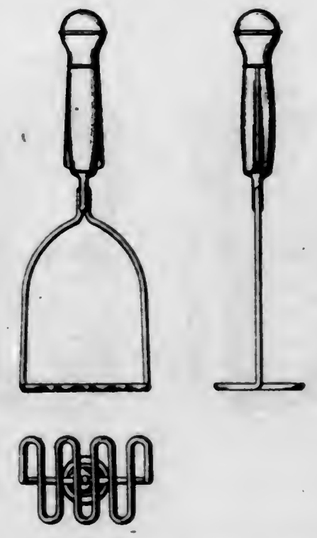
1. In the production of a rosin ester of low unsaturation from rosin of high unsaturation, the process for concurrently effecting esterification and reduction of unsaturation, which process consists in heating the rosin to a temperature between about 150° C. and 300° C. and subjecting the heated rosin concurrently to the action of an alcohol and of from 0.5% to 25% by weight of the rosin of sulfur, the temperature and time of heating being sufficient to effect esterification and reduction of unsaturation.



2,409,174
LUMINESCENT MATERIALS
Herbert J. Dietz, Rochester, N. Y., assignor to Eastman Kodak Company, Rochester, N. Y., a corporation of New Jersey
No Drawing. Application May 2, 1944, Serial No. 533,802
5 Claims. (Cl. 252—301.4)

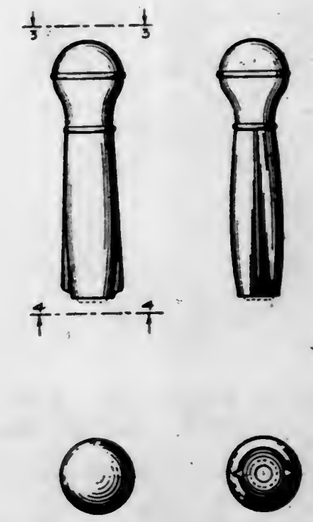
1. A luminescent composition comprising as its principal ingredient a barium fluorhalide which has been heat-treated at a temperature of the order of 1450° and containing at least one quarter of one per cent by weight of a silicon compound selected from the silico fluorides, the silicates and silicon dioxide.

DESIGNS



OCTOBER 8, 1946

145,685
DESIGN FOR A KITCHEN TOOL OR SIMILAR ARTICLE
James Harvey Chandler, Oak Park, and Allen J. Eggleston, Chicago, Ill., assignors to Ekco Products Company, Chicago, Ill., a corporation of Illinois
Application August 4, 1945, Serial No. 121,208
Term of patent 14 years
(Cl. D44—29)

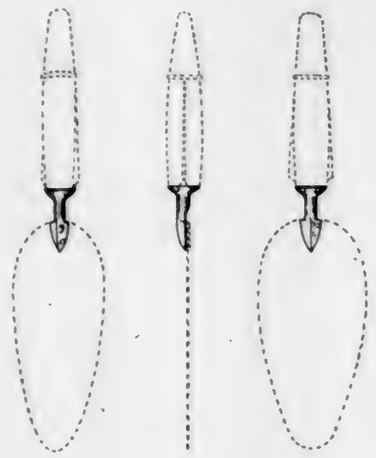


The ornamental design for a kitchen tool or similar article, as shown and described.

145,686
DESIGN FOR A KITCHEN TOOL OR SIMILAR ARTICLE
James Harvey Chandler, Oak Park, and Allen J. Eggleston, Chicago, Ill., assignors to Ekco Products Company, Chicago, Ill., a corporation of Illinois
Application September 19, 1945, Serial No. 122,180
Term of patent 14 years
(Cl. D89—1)

The ornamental design for a kitchen tool or similar article, as shown.

145,687
DESIGN FOR A HANDLE FOR KITCHEN UTENSILS OR SIMILAR ARTICLES
James Harvey Chandler, Oak Park, Ill., assignor to Ekco Products Company, Chicago, Ill., a corporation of Illinois
Application September 19, 1945, Serial No. 122,183
Term of patent 14 years
(Cl. D44—29)



The ornamental design for a handle for kitchen utensils or similar articles, as shown.

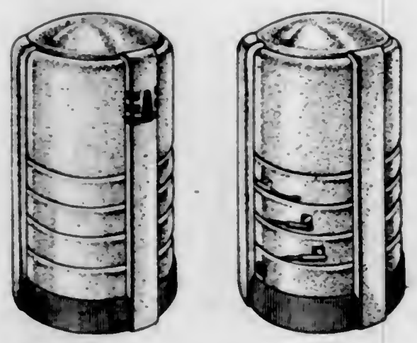
145,688
DESIGN FOR A SHOE
Joseph K. Eagan, Peoria, Ill.
Application April 26, 1946, Serial No. 128,974
Term of patent 3½ years
(Cl. D7—7)

The ornamental design for a shoe, as shown.

145,689
DESIGN FOR A KITCHEN TOOL OR SIMILAR ARTICLE
Allen J. Eggleston, Chicago, Ill., assignor to Ekco Products Company, a corporation of Illinois
Application June 30, 1945, Serial No. 120,414
Term of patent 14 years
(Cl. D44—29)

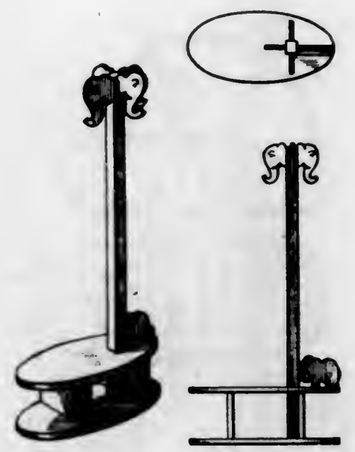
The ornamental design for a kitchen tool or similar article, as shown and described.

145,690
DESIGN FOR A LUBRICATING EQUIPMENT CABINET
Arthur M. Fitzpatrick, Jr., Detroit, Mich., assignor to Stewart-Warner Corporation, Chicago, Ill., a corporation of Virginia
Application October 26, 1945, Serial No. 123,216
Term of patent 14 years
(Cl. D52—2)



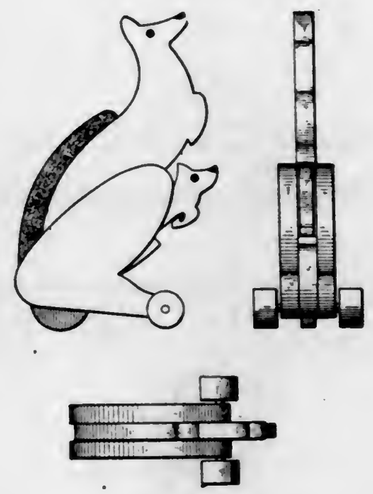
The ornamental design for a lubricating equipment cabinet, substantially as shown and described.

145,691
DESIGN FOR A LUBRICATING EQUIPMENT CABINET
Arthur M. Fitzpatrick, Jr., Detroit, Mich., assignor to Stewart-Warner Corporation, Chicago, Ill., a corporation of Virginia
Application October 26, 1945, Serial No. 123,217
Term of patent 14 years
(Cl. D52—2)



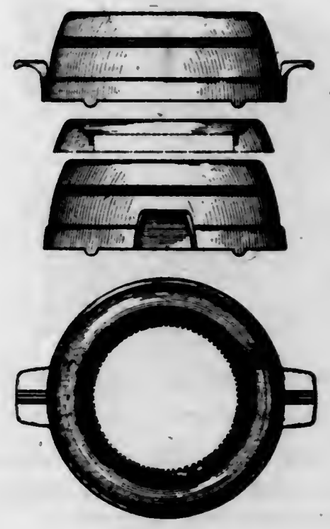
The ornamental design for a lubricating equipment cabinet, substantially as shown and described.

145,692
DESIGN FOR A LUBRICATING EQUIPMENT CABINET
Arthur M. Fitzpatrick, Jr., Detroit, Mich., assignor to Stewart-Warner Corporation, Chicago, Ill., a corporation of Virginia
Application October 26, 1945, Serial No. 123,218
Term of patent 14 years
(Cl. D52—2)



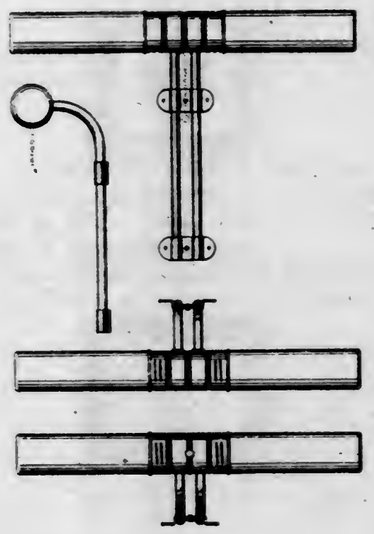
The ornamental design for a lubricating equipment cabinet, substantially as shown.

145,693
DESIGN FOR A YOUTH'S COSTUMER
Jack W. Floyd, Seattle, Wash.
Application November 23, 1945, Serial No. 124,039
Term of patent 7 years
(Cl. D33—8)



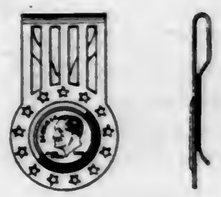
The ornamental design for a youth's costumer, as shown.

145,694
DESIGN FOR A PULL TOY
John A. Healey, Chicago, Ill.
Application September 24, 1945, Serial No. 122,269
Term of patent 14 years
(Cl. D34—15)



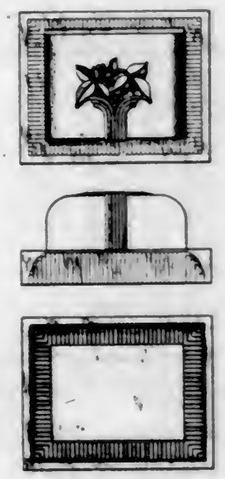
The ornamental design for a pull toy, as shown.

145,695
DESIGN FOR AN ELECTRIC STOVE
Raymond Heer, Chicago, Ill., assignor to General Consumer Products, Inc., Chicago, Ill., a corporation of Illinois
Application December 15, 1945, Serial No. 124,769
Term of patent 14 years
(Cl. D81—10)



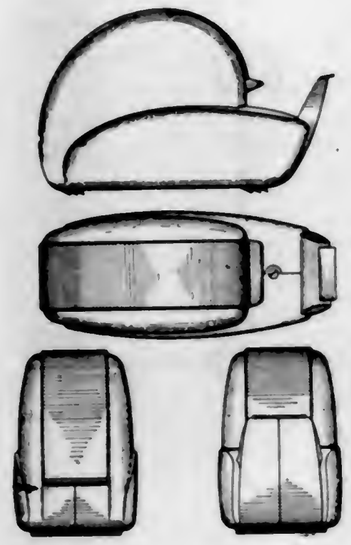
The ornamental design for an electric stove, as shown and described.

145,696
DESIGN FOR A LIGHT FIXTURE
Clyde D. McCann, Des Moines, Iowa
Application November 10, 1945, Serial No. 123,652
Term of patent 14 years
(Cl. D48—4)



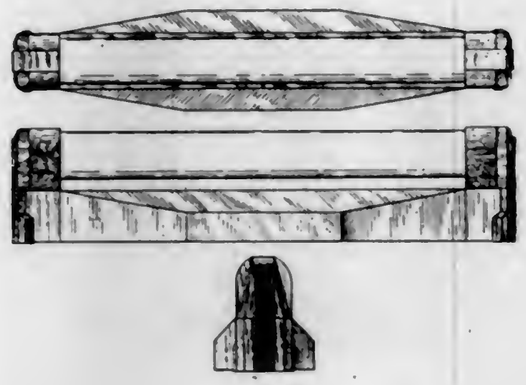
The ornamental design for a light fixture, substantially as shown and described.

145,697
DESIGN FOR A MONEY CLIP
Charles E. Mills, Cleveland, Ohio, assignor to Juno Products Company, an Ohio partnership composed of Erick Weinberger and S. Weinberger
Application June 7, 1946, Serial No. 130,503
Term of patent 3½ years
(Cl. D74—2)



The ornamental design for a money clip, substantially as shown and described.

145,698
DESIGN FOR A GIFT BOX
William B. Petzold, Pittsfield, Mass., assignor to General Electric Company, a corporation of New York
Application November 14, 1945, Serial No. 123,747
Term of patent 14 years
(Cl. D58—12.6)

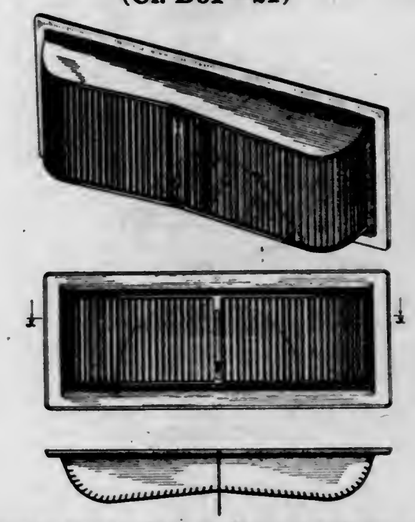


The ornamental design for a gift box, as shown.

145,699
DESIGN FOR A TAPE DISPENSER
Harry Preble, Jr., New York, N. Y., assignor to International Plastic Corporation, Morristown, N. J., a corporation of Illinois
Application January 26, 1946, Serial No. 126,019
Term of patent 14 years
(Cl. D74—1)

The ornamental design for a tape dispenser, substantially as shown.

145,700
DESIGN FOR A FLUORESCENT LIGHTING FIXTURE
Nathan M. Robboy, Cleveland Heights, Ohio
Application November 20, 1945, Serial No. 123,925
Term of patent 14 years
(Cl. D48—23)



The ornamental design for a fluorescent lighting fixture, substantially as shown.

145,701
DESIGN FOR AN ANIMAL FIGURE
William W. Rodgers, Wilmington, Del.
Application June 26, 1946, Serial No. 131,060
Term of patent 14 years
(Cl. D34—2)

The ornamental design for an animal figure, as shown.

145,702
DESIGN FOR A REGISTER OR SIMILAR ARTICLE
Morris Sanders, New York, N. Y., assignor to Minneapolis-Honeywell Regulator Company, Minneapolis, Minn., a corporation of Delaware
Application October 15, 1945, Serial No. 122,833
Term of patent 14 years
(Cl. D81—21)

The ornamental design for a register or similar article, substantially as shown.

145,703
DESIGN FOR A DRESS
Max Schneck, Long Island, N. Y., assignor to Max Schneck & Bros., Inc., New York, N. Y., a corporation of New York
Application October 17, 1945, Serial No. 122,922
Term of patent 3½ years
(Cl. D3—26)

The ornamental design for a dress, substantially as shown.

145,704
DESIGN FOR A DRESS
Max Schneck, Long Island, N. Y., assignor to Max Schneck & Bros., Inc., New York, N. Y., a corporation of New York
Application October 17, 1945, Serial No. 122,923
Term of patent 3½ years
(Cl. D3—26)

The ornamental design for a dress, substantially as shown.

145,705
DESIGN FOR A CLIP BOOKMARK
Edward Leonidas Woodley, Baird, Tex.
Application January 21, 1946, Serial No. 125,828
Term of patent 14 years
(Cl. D6—1)

The ornamental design for a clip bookmark, as shown.

145,706
DESIGN FOR A CLIP BOOKMARK
Edward Leonidas Woodley, Baird, Tex.
Application April 5, 1946, Serial No. 128,328
Term of patent 14 years
(Cl. D6—1)

The ornamental design for a clip bookmark, as shown.

LIST OF TRADE-MARK APPLICANTS

PUBLISHED FOR OPPOSITION

[Act of Feb. 20, 1905, Sec. 6, as amended Mar. 2, 1907]

Airkem, Inc., New York, N. Y. Preparations for freshening or deodorizing the air. Serial No. 498,573; Oct. 8. Class 6.

American Engineering Company, Philadelphia, Pa. Electric hoists, electric winches, electric windlasses, etc. Serial No. 499,984; Oct. 8. Class 21.

Artcraft Metal Products, Inc., West Haven, Conn. Toy sewing machines. Serial No. 506,573; Oct. 8. Class 22.

Artistic Card Company, Elmira, N. Y. Greeting cards. Serial No. 489,708; Oct. 8. Class 38.

Barone, Tony, doing business as Laboratory Products Company, Detroit, Mich. Medicines. Serial No. 494,006; Oct. 8. Class 6.

Beau Brummel Polish Corp., Brooklyn, N. Y. Shoe polish. Serial No. 494,650; Oct. 8. Class 4.

Becton, Dickinson & Co., Rutherford, N. J. Clinical thermometers. Serial No. 506,634; Oct. 8. Class 44.

Bevodel Company, The, Sacramento, Calif. Nonalcoholic, maltless beverages. Serial No. 502,941; Oct. 8. Class 45.

Biggar & Biggar, Fort Myers, Fla. Fresh vegetables. Serial No. 497,010; Oct. 8. Class 46.

Bird Electronic Corporation, The, Cleveland, Ohio. Electrical switches. Serial No. 497,990; Oct. 8. Class 21.

Bishop, J., & Company Platinum Works, Malvern, Pa. Hypodermic needles. Serial No. 505,727; Oct. 8. Class 44.

Bloomfield Company, The, Cleveland, Ohio. Women's outer apparel. Serial No. 497,065; Oct. 8. Class 39.

Boyle-Midway Inc., Jersey City, N. J. Hand sprayers. Serial Nos. 499,476–7; Oct. 8. Class 23.

Breuer Electric Mfg. Co., Chicago, Ill. Electric markers, and etchers. Serial No. 498,752; Oct. 8. Class 21.

Breuer Electric Mfg. Co., Chicago, Ill. Electric dust collectors. Serial No. 498,753; Oct. 8. Class 21.

Brunswick-Balke-Collender Company,, The, Wilmington, Del., and Chicago, Ill. Bowling balls. Serial No. 506,729; Oct. 8. Class 22.

Caldex Company, The, Sheldon, Ill. Toy gliders. Serial No. 506,798; Oct. 8. Class 22.

Cargair, Inc., Los Angeles, Calif. Refrigerators for refrigerating goods being transported. Serial No. 485,193; Oct. 8. Class 31.

Cleveland, Clark, Inc., Binghamton, N. Y. Dental plate cleaner, in powder form. Serial No. 495,012; Oct. 8. Class 4.

Clougherty Bros., assignor to Clougherty Packing Company, Vernon, Calif. Meat and meat products. Serial No. 491,232; Oct. 8. Class 46.

Clougherty Packing Company, assignee: *See*—
Clougherty Bros.

Cohen Bros. Specialties Inc., New York, N. Y. Men's outer shirts, lounging and bath robes, and sport coats. Serial No. 498,604; Oct. 8. Class 39.

Colgate-Palmolive-Peet Company, Jersey City, N. J. Household cleanser. Serial Nos. 495–588–9; Oct. 8. Class 4.

College Deb Coats: *See*—
Jerry Coat Company.

Concordade Company, Inc., Providence, R. I. Non-alcoholic, non-cereal, maltless beverages. Serial No. 502,122; Oct. 8. Class 45.

Consolidated Cosmetics, Chicago, Ill. Leather cosmetic kit bags and cases, etc. Serial No. 493,325; Oct. 8. Class 3.

Consolidated Cosmetics, Chicago, Ill. China dinnerware and china and earthenware chambers, pitchers, etc. Serial No. 500,605; Oct. 8. Class 30.

Constant, Harold E., doing business as Constant Hosiery Mills, Milwaukee, Wis. Hosiery. Serial No. 490,795; Oct. 8. Class 39.

Constant Hosiery Mills: *See*—
Constant, Harold E.

Constitution Tobacco Products Corp., New York, N. Y. Cigarettes. Serial No. 499,319; Oct. 8. Class 17.

Cosmetic Arts Laboratories: *See*—
Grossman, Eve R.

Couper, Thomas B., Jr., Glen Ridge, N. J. Phonograph sound records. Serial No. 497,848; Oct. 8. Class 36.

Daniels, C. R., Inc., Hillsdale, Baltimore, Md. Tents. Serial No. 498,507; Oct. 8. Class 50.

Davis, J. W., Company: *See*—
Davis, Joseph W.

Davis, Joseph W., doing business as J. W. Davis Company, Bloomington, Ill. Belt type conveying apparatus. Serial No. 494,821; Oct. 8. Class 23.

De Marbel (Société à Responsabilité Limitée), Neuilly Sur Seine, France. Perfumes, toilet waters, rouge, etc. Serial No. 498,986; Oct. 8. Class 6.

District of Columbia Paper Mills, Inc., Washington, D. C. Blotting paper, box cover paper, cover papers, etc. Serial No. 490,580; Oct. 8. Class 37.

District of Columbia Paper Mills, Inc., Washington, D. C. Blotting paper, box cover paper, cover papers, etc. Serial No. 493,329; Oct. 8. Class 37.

Diversified Fabrics, Inc., New York, N. Y. Rayon piece goods. Serial No. 477,262; Oct. 8. Class 42.

Dohrmann Hotel Supply Co., San Francisco, Calif. Janitorial supplies. Serial No. 487,598; Oct. 8. Class 4.

Duell, Edith B., Detroit, Mich. Cigarette cases. Serial No. 497,923; Oct. 8. Class 8.

E. N. T. Tampon Company: *See*—
Riordan, Howard C.

Eaton-Dikeman Company, The, Mount Holly Springs, Pa. Filter paper. Serial No. 495,279; Oct. 8. Class 31.

Eaton Manufacturing Company, Cleveland, Ohio. Heat, wear, corrosion and erosion resistant poppet valve mechanisms, facings and parts thereof. Serial No. 494,826; Oct. 8. Class 23.

Edo Aircraft Corporation, New York, and College Point, Long Island, N. Y. Step stools. Serial No. 506,585; Oct. 8. Class 32.

Electric Sprayit Co., The, Sheboygan, Wis. Hydraulic actuating cylinders, hydraulic operating valves, air compressors, etc. Serial No. 481,617; Oct. 8. Class 23.

Electric Steel Foundry, Portland, Oreg. Plastic metallic gaskets. Serial No. 490,939; Oct. 8. Class 35.

Endo Products, Inc., New York, N. Y. Hematinic. Serial No. 489,051; Oct. 8. Class 6.

Essick Manufacturing Company, Los Angeles, Calif. Concrete mixers. Serial No. 489,725; Oct. 8. Class 23.

Ewing, Ray, Company, The, South Pasadena, Calif. Vitamin and amino acid supplement. Serial No. 497,472; Oct. 8. Class 6.

Farm Minerals Company, Inc., The, Fishers, Ind. Supplement for feed for poultry, live stock or other animals. Serial No. 497,085; Oct. 8. Class 6.

Fluordent, Inc., New Orleans, La. Dentifrice. Serial No. 491,251; Oct. 8. Class 6.

Galloway, George M., doing business as Grand Lake Fishing Tackle, Celina, Ohio. Artificial fish baits. Serial No. 504,172; Oct. 8. Class 22.

General Aniline & Film Corporation, New York, N. Y. Photographic cameras. Serial No. 491,640; Oct. 8. Class 26.

General Ceramics and Steatite Corporation, Keasbey, N. J. Electrical apparatus in the nature of combinations of metals and ceramics. Serial No. 481,021; Oct. 8. Class 21.

Gilcor Manufacturing Company, Inc., New York, N. Y. Liquid laundry starch. Serial No. 497,789; Oct. 8. Class 6.

Gildner, Henry G., doing business as Travel-Toi Company, Detroit, Mich. Children's toilet chairs. Serial No. 497,662; Oct. 8. Class 32.

Gill, J. J., & Associates, Los Angeles, Calif. Artificial fish bait. Serial No. 504,267; Oct. 8. Class 22.

Glensder Textile Co., New York, N. Y. Ladies' and children's hats, and hat and scarf sets. Serial No. 487,253; Oct. 8. Class 39.

Gojer Laboratories, Akron, Ohio. Detergents. Serial No. 493,374; Oct. 8. Class 4.

Goldstein, Irving, Forest Hills, N. Y. Ladies', misses', and junior misses' dresses. Serial No. 499,620; Oct. 8. Class 39.

Gonyea, Maude, Hazel Park, Mich. Hair restorer. Serial No. 499,548; Oct. 8. Class 6.

Grand Lake Fishing Tackle: *See*—
Galloway, George M.

Grossman, Eve R., doing business as Cosmetic Arts Laboratories, Upper Montclair, N. Y. Nail polish, nail oil, skin cream, etc. Serial No. 494,557; Oct. 8. Class 6.

Hall, Storrs H., Southgate, Calif. Perfume. Serial No. 498,992; Oct. 8. Class 6.

Harter Corporation, Sturgis, Mich. Chairs, seats, and office stands, etc. Serial No. 506,314; Oct. 8. Class 32.

Heribert, Herbert J., New York, N. Y. Plastic composition. Serial No. 497,860; Oct. 8. Class 1.

Heribert, Herbert J., New York, N. Y. Solution to be used as a coating, finish or lacquer for textiles and for plastics. Serial No. 497,861; Oct. 8. Class 6.

Hester, George C., Glendale, doing business as Janet Hester, Hollywood, Calif. Perfumes. Serial Nos. 498,139–40; Oct. 8. Class 6.

Hester, Janet: *See*—
Hester, George C.

Hills Bros. Coffee, Inc., San Francisco, Calif. Coffee. Serial Nos. 495,800–1; Oct. 8. Class 46.

Hilltop Farm Feed Company, Minneapolis, Minn. Poultry feeds. Serial No. 478,326; Oct. 8. Class 46.

Hoak, D. R., doing business as West Coast Growers & Packers, Fresno, Calif. Raisins. Serial No. 500,304; Oct. 8. Class 46.

Hudson Products, Inc., Jersey City, N. J. Cream for holding false teeth tightly. Serial No. 499,231; Oct. 8. Class 6.
Hunt Foods, Inc., San Francisco, Calif. Canned fruits and vegetables. Serial No. 495,475; Oct. 8. Class 46.
Jana Handbags, Inc., New York, N. Y. Ladies' handbags. Serial No. 506,602; Oct. 8. Class 3.
Jefferson Chemical Company, Inc., New York, N. Y. Ethylene oxide and ethylene glycol. Serial No. 497,864; Oct. 8. Class 6.
Jerry Coat Company, doing business as College Deb Coats, New York, N. Y. Women's junior coats and suits. Serial No. 493,445; Oct. 8. Class 39.
Kaktine Company, The, Glendale, Calif. Preparation having use as a mouth wash and throat gargle. Serial No. 484,407; Oct. 8. Class 6.
Keen-Aire Research Laboratories: *See*—
Keenoy, F. P.

CLASS 11

Ink in paste form, Writing and printing. American Crayon Company. 219,746; renewed Oct. 26, 1946. O. G. Oct. 8.
Typewriter ribbons. Thurston Cutting Corporation. 212,732; renewed May 11, 1946. O. G. Oct. 8.

CLASS 12

Brick. Acme Brick Company. 219,422; renewed Oct. 19, 1946. O. G. Oct. 8.
Flooring, Rubber-tile. Republic Rubber Company. 218,429; renewed Sept. 28, 1946. O. G. Oct. 8.
Jackets for water heaters and boilers Asbestos felt. Bastian-Morley Co. 218,182; renewed Sept. 21, 1946. O. G. Oct. 8.
Linings, fire bricks, face bricks, etc., Furnace. Caroline Refractories Company. 220,447; renewed Nov. 9, 1946. O. G. Oct. 8.

CLASS 13

Fencing, Woven-wire. American Steel and Wire Company. 53,740; re-renewed June 12, 1946. O. G. Oct. 8.
Heel-plates for boots and shoes. L. Sacks. 56,506; re-renewed Oct. 2, 1946. O. G. Oct. 8.
Valves and parts thereof, Self-aligning pump. Madsen Iron Works. 424,430; Oct. 8; Serial No. 469,409; published July 16, 1946.

CLASS 14

Castings made of all non-ferrous metals, Metal. Doehler Die Casting Co. 424,546; Oct. 8.
Castings, Railway-car. National Malleable Castings Company. 55,135; re-renewed Aug. 7, 1946. O. G. Oct. 8.
Stampings from all metals and for all purposes, etc., Metal. Edwin B. Stimpson Company. 214,955; renewed July 6, 1946. O. G. Oct. 8.
Stampings from all metals and for all purposes, etc., Metal. Edwin B. Stimpson Company. 216,343; renewed Aug. 10, 1946. O. G. Oct. 8.
Steel in the form of wire, strips, billets and shapes. Carpenter Steel Company. 424,558; Oct. 8.

CLASS 15

Gasoline, kerosene, fuel oil, etc. Northern Iowa Oil Company. 220,339; renewed Nov. 9, 1946. O. G. Oct. 8.
Graphite wads sold in ribbon form. W. W. Perkins. 424,469; Oct. 8; Serial No. 487,521; published July 16, 1946.
Lubricant and cleaner, Handpiece. Dental-Specialty Manufacturing Co. 424,499; Oct. 8; Serial No. 493,433; published July 2, 1946.
Oil, Lubricating. J. L. Patrick. 424,465; Oct. 8; Serial No. 487,202; published June 25, 1946.
Oils and greases, Lubricating. Frank W. Dryden & Sons. 424,449; Oct. 8; Serial No. 484,163; published June 25, 1946.
Oils and greases, Lubricating. Panther Oil & Grease Mfg. Co. 216,371; renewed Aug. 10, 1946. O. G. Oct. 8.
Oils, Lubricating. Sonard Corporation. 424,487; Oct. 8; Serial No. 491,371; published June 25, 1946.
Oils, Lubricating. Sun Oil Company. 424,506–9; Oct. 8; Serial Nos. 494,372–5; published July 16, 1946.

CLASS 16

Cleaning and polishing compound for automobiles, etc. F. W. Evans. 424,563; Oct. 8.
Colors; artists' oils, varnishes, etc., Artists' school, and show-card. F. Weber Co. 220,190; renewed Nov. 2, 1946. O. G. Oct. 8.
Lacquer, Ready-mixed. James B. Sipe & Company. 218,650–1; renewed Sept. 28, 1946. O. G. Oct. 8.
Lacquers. Gilbert Sprucance Co. 219,333; renewed Oct. 19, 1946. O. G. Oct. 8.
Lacquers, Ready-mixed. Geo. D. Wetherill & Co., Inc. 216,724; renewed Aug. 17, 1946. O. G. Oct. 8.
Paint, Mixed and paste. James B. Sipe & Company. 218,675; renewed Sept. 28, 1946. O. G. Oct. 8.
Paints, Mixed. G. C. Hascall. 56,587; re-renewed Oct. 9, 1946. O. G. Oct. 8.
Paints, Mixed and paste. James B. Sipe & Company. 218,439; renewed Sept. 28, 1946. O. G. Oct. 8.
Paints, Ready-mixed. Geo. D. Wetherill & Co., Inc. 216,611; renewed Aug. 17, 1946. O. G. Oct. 8.

CLASS 19

Bicycles. Kauffmann Department Stores, Inc. 214,341; renewed June 22, 1946. O. G. Oct. 8.

CLASS 21

Atomizer, Electrically heated. Tanglefoot Company. 424,466; Oct. 8; Serial No. 487,218; published July 16, 1946.
Connectors, Electrical. J. D. Benfield. 424,475; Oct. 8; Serial No. 488,733; published July 16, 1946.
Cords, Extensible electrical. Kellogg Switchboard and Supply Company. 424,468; Oct. 8; Serial No. 487,422; published July 16, 1946.
Cords, Extensible electrical. Kellogg Switchboard and Supply Company. 424,530–1; Oct. 8; Serial Nos. 495,745–6; published July 16, 1946.
Electric fences. R. H. Turk. 424,467; Oct. 8; Serial No. 487,342; published July 16, 1946.
Electric motor and hydraulic coupling drives, Combined. Link-Belt Company. 424,560; Oct. 8.
Electric motors and parts thereof and electric generators and parts thereof. Master Electric Company. 424,431; Oct. 8; Serial No. 471,266; published July 16, 1946.
Electric toaster. Lexington Machinery & Development Co., Inc. 424,505; Oct. 8; Serial No. 493,971; published July 16, 1946.
Electric welding apparatus. A. O. Smith Corporation. 424,432; Oct. 8; Serial No. 471,762; published July 16, 1946.
Electrical equipment and appliances. W. W. Barr. 424,503; Oct. 8; Serial No. 493,879; published July 16, 1946.
Electrical insulating materials. H. D. Isenberg. 424,444; Oct. 8; Serial No. 483,306; published July 16, 1946.
Electrical motors, Fractional horse power. Lamb Electric Company. 424,435; Oct. 8; Serial No. 479,850; published July 16, 1946.
Eliminators, Static. United States Radium Corporation. 424,518; Oct. 8; Serial No. 495,347; published July 9, 1946.
Fencers, Electric paint conditioners, electric paint mixers, etc., Electric. Red Devil Tools. 424,479; Oct. 8; Serial No. 490,398; published July 16, 1946.
Lighting equipment, Photographic. M. Black. 424,493; Oct. 8; Serial No. 492,354; published July 16, 1946.
Lights and electric controllers therefor, etc., Traffic signal. E. A. Brass. 424,443; Oct. 8; Serial No. 483,206; published July 16, 1946.
Radio antennas, Transmitting and receiving. Shur-Antenna-Mount, Inc. 424,481; Oct. 8; Serial No. 490,709; published July 16, 1946.
Radio home receiving sets. Molded Insulation Company. 424,517; Oct. 8; Serial No. 495,322; published July 9, 1946.
Radio receiving sets, electric record players, radio manual, etc. Aviola Radio Corporation. 424,490; Oct. 8; Serial No. 492,125; published July 16, 1946.
Radio receiving sets, loud speakers, and reproducing units, etc. Electrical Research Laboratories, Inc. 212,709; renewed May 11, 1946. O. G. Oct. 8.
Radios, and radio and phonograph combinations. Cavendish Trading Corp. 424,511; Oct. 8; Serial No. 494,653; published July 16, 1946.
Scissors, Electric. Atlas Instrument Company. 424,516; Oct. 8; Serial No. 495,161; published July 9, 1946.
Signalling apparatus, Electrical supervisory, Alarm. Russell & Stoll Company, Inc. 424,459; Oct. 8; Serial No. 485,887; published July 16, 1946.

CLASS 22

Implements, apparatus, and articles used in athletic games and sports, Certain named. A. G. Spalding & Bros. 56,737–38; re-renewed Oct. 16, 1946. O. G. Oct. 8.
Rackets, Badminton and tennis. Bancroft Racket Company. 424,582; Oct. 8.
Spinners. Enterprise Manufacturing Company. 219,474; renewed Oct. 19, 1946. O. G. Oct. 8.
Supports for golf bags. Sports Products Corporation. 424,565; Oct. 8.
Toy banks, Plastic. Toy Town Corporation. 424,484; Oct. 8; Serial No. 491,180; published July 16, 1946.
Toy model aircraft. International Model Aircraft Limited. 424,436; Oct. 8; Serial No. 481,111; published July 16, 1946.
Toy plastic coin banks. S. Meyerson. 424,536; Oct. 8; Serial No. 498,017; published July 16, 1946.

CLASS 23

Air bags for tire repairing, Sectional. Firestone Tire & Rubber Company. 424,424; Oct. 8; Serial No. 453,507; published July 16, 1946.
Bearings, Engine. McQuay-Norris Manufacturing Company. 424,458; Oct. 8; Serial No. 485,876; published July 9, 1946.
Brush and dustpan, Unitary combination mechanical. Stamping Service, Inc. 424,502; Oct. 8; Serial No. 493,843; published July 16, 1946.
Cranes mounted on rubber tired automobile trucks chassis, Lifting. Insley Manufacturing Corporation. 424,575; Oct. 8.
Crushers. Jeffrey Manufacturing Company. 424,439; Oct. 8; Serial No. 481,791; published July 16, 1946.
Cylinders, Master. New York Air Brake Company. 424,519; Oct. 8; Serial No. 495,555; published July 9, 1946.
Dusting machines used in applying insecticidal powders to vegetation. A. W. Gustafson. 424,544; Oct. 8.
Elevators, escalators, endless carriers, etc. Otis Elevator Company. 219,894; renewed Oct. 26, 1946. O. G. Oct. 8.
Filters, Oil. Fram Corporation. 424,473; Oct. 8; Serial No. 488,401; published July 16, 1946.
Fire extinguishers, Portable hand. Buffalo Fire Appliance Corporation. 424,562; Oct. 8.
Gears, Precision. Beaver Gear Works, Inc. 424,438; Oct. 8; Serial No. 481,691; published Nov. 13, 1945.
Guides made of sapphire, ruby, corundum, etc., Thread. John Worley Jewel Company. 424,568; Oct. 8.
Guns, Cleaning. Southern Supply Co. 424,461; Oct. 8; Serial No. 486,506; published July 9, 1946.
Hay-carriers. F. E. Myers & Brother. 56,933; re-renewed Oct. 23, 1946. O. G. Oct. 8.
Holders for drilling, boring, reaming, etc., tools. F. Burg. 424,437; Oct. 8; Serial No. 481,313; published July 16, 1946.
Industrial and/or municipal apparatus. Permutit Company. 424,426; Oct. 8; Serial No. 459,013; published July 16, 1946.
Jacks, Hydraulic automotive. Federal Auto Products Company. 424,577; Oct. 8.
Jigs, Drilling. Oscar W. Hedstrom Corporation. 424,549; Oct. 8.
Knives, shears, kitchen knives, etc., Pen. Queen City Cutlery Company. 424,480; Oct. 8; Serial No. 490,447; published July 16, 1946.
Milking equipment. Babson Bros. Co. 424,488; Oct. 8; Serial No. 492,027; published July 16, 1946.
Pumps, Piston type force. Hasco Valve and Machine Co. 424,504; Oct. 8; Serial No. 493,957; published July 16, 1946.
Rake, Lawn. Hayden Company. 424,510; Oct. 8; Serial No. 494,502; published July 16, 1946.
Rakes, Pick-up. New Standard Corporation. 424,515; Oct. 8; Serial No. 495,089; published July 9, 1946.
Rasps and files. Stokes Bros. Manufacturing Co. 424,471; Oct. 8; Serial No. 488,288; published July 16, 1946.
Razor blades. Affiliated Retailers, Inc. 424,512–14; Oct. 8; Serial Nos. 494,998–495,000; published July 9, 1946.
Reels, Hand-operated. C. J. Bates & Son. 424,434; Oct. 8; Serial No. 474,107; published July 16, 1946.
Scissors, sewing scissors, pocket scissors, etc., Household. Rex Cutlery Corporation. 424,559; Oct. 8.
Spoons, forks, spears, etc., Molded plastic cocktail. E. S. Tupper. 424,494; Oct. 8; Serial No. 492,405; published July 16, 1946.
Taps and small cutting tools. Greenfield Tap and Die Corporation. 424,545; Oct. 8.
Tools, Diamond carrying. Industrial Abrasives, Inc. 424,554; Oct. 8.
Transmitting apparatus, Rotary motion. Kearfott Engineering Co. 424,450; Oct. 8; Serial No. 484,300; published July 16, 1946.
Vending machines. Knapway Devices, Inc. 424,500; Oct. 8; Serial No. 493,496; published July 16, 1946.
Water systems. Marshall-Wells Company. 424,441; Oct. 8; Serial No. 482,431; published July 16, 1946.
Windmills. Aermotor Company. 56,596; re-renewed Oct. 9, 1946. O. G. Oct. 8.

CLASS 26

Dispensing devices, Self-measuring oil and grease. Bennett Pumps Corporation. 218,118; renewed Sept. 21, 1946. O. G. Oct. 8.
Electric-mechanical instrument. Electronic Mechanical Products Company. 424,460; Oct. 8; Serial No. 486,298; published July 16, 1946.
Handle and guard for portable electric lamps. Daniel Woodhead Company. 219,779; renewed Oct. 26, 1946. O. G. Oct. 8.
Lenses and goggle lenses or glasses, Eyeglass. Butler Optical Company. 424,551; Oct. 8.
Lubrication equipment. Balcrank Inc. 424,451; Oct. 8; Serial No. 484,337; published July 16, 1946.
Potentiometers. G. M. Giannini & Co. Inc. 424,570; Oct. 8.
Scales, Weighing. Chicago Dietetic Supply House, Inc. 218,862; renewed Oct. 5, 1946. O. G. Oct. 8.
Screens, Protection. Society for Visual Education, Inc. 424,576; Oct. 8.
Test sets and testing equipment. Udylite Process Corporation. 220,590; renewed Nov. 9, 1946. O. G. Oct. 8.
Testing devices for vehicle wheels. Testing Apparatus, Inc. 424,427; Oct. 8; Serial No. 460,129; published May 22, 1945.

CLASS 29

Brushes. Hanlon & Goodman Co. 217,967; renewed Sept. 14, 1946. O. G. Oct. 8.
Cleaning and polishing cloths, Unimpregnated. Nathan H. Poor Company. 219,066; renewed Oct. 12, 1946. O. G. Oct. 8.

CLASS 30

Chinaware, Articles of. Sapun Ceramics, Inc. 424,573; Oct. 8.
Crockery, earthenware, and porcelain, etc. Michaels & Co., Inc. 424,489; Oct. 8; Serial No. 492,071; published June 25, 1946.

CLASS 31

Pump and filter units, Combined portable. Wallace & Tiernan Co., Inc. 424,476; Oct. 8; Serial No. 489,830; published July 16, 1946.

CLASS 32

Furniture, Certain articles of. N. D. Cass Co. 219,987; renewed Oct. 26, 1946. O. G. Oct. 8.
Furniture, Juvenile and nursery. S. M. Leach. 424,564; Oct. 8.
Racks, Filing. Remington Rand Inc. 424,452; Oct. 8; Serial No. 484,359; published Sept. 25, 1945.
Tables, card tables, corner tables, Trestle. Habitant Shops, Inc. 424,478; Oct. 8; Serial No. 490,306; published July 16, 1946.

CLASS 33

Glass, Articles made of. Revoc, Inc. 424,472; Oct. 8; Serial No. 488,374; published July 9, 1946.
Glass containers. Corning Glass Works. 424,425; Oct. 8; Serial No. 453,716; published July 16, 1946.
Glass perfume bottles, table glassware, glass beverage sets, etc. Gailstyn Company. 424,496; Oct. 8; Serial No. 492,434; published July 16, 1946.
Glassware, Hand painted table. R. L. Le May. 424,482; Oct. 8; Serial No. 490,952; published July 16, 1946.
Glasses and crystals. Watch. Hammel, Riglander & Co. 220,416; renewed Nov. 9, 1946. O. G. Oct. 8.

CLASS 34

Acetylene welding and cutting apparatus and parts thereof. Oxweld Acetylene Company. 220,133; renewed Nov. 2, 1946. O. G. Oct. 8.
Apparatus for the exchange of heat. La Mont Corporation. 213,076; renewed May 18, 1946. O. G. Oct. 8.

CLASS 35

Hose, Rubber and rubber-fabric. Republic Rubber Company. 218,479; renewed Sept. 28, 1946. O. G. Oct. 8.
Patches for pneumatic vehicle tires, Blow-out. Goodyear Tire & Rubber Company. 218,161; renewed Sept. 21, 1946. O. G. Oct. 8.
Tires and inner tubes, Pneumatic motor-vehicle. Pharis Tire and Rubber Company. 218,866; renewed Oct. 5, 1946. O. G. Oct. 8.

CLASS 36

Musical instruments, Stringed. Gibson, Inc. 219,149; renewed Oct. 12, 1946. O. G. Oct. 8.
Phonograph grooved records. Manor Record Co. 424,462; Oct. 8; Serial No. 486,796; published July 16, 1946.
Phonograph records, phonograph apparatus, and parts thereof, etc. Columbia Phonograph Company, Inc. 219,539; renewed Oct. 19, 1946. O. G. Oct. 8.
Zithers. Oscar Schmidt-International, Incorporated. 424,491; Oct. 8; Serial No. 492,157; published June 25, 1946.

CLASS 37

Envelopes, letterheads, billheads, etc., Printed mailing. J. S. Bridges. 218,755; renewed Oct. 5, 1946. O. G. Oct. 8.
Loose-leaf binders, loose-leaf blank books and parts thereof, etc. Lefax. 218,813; renewed Oct. 5, 1946. O. G. Oct. 8.
Paper and envelopes, Writing. Strombeck Press Inc. 424,429; Oct. 8; Serial No. 469,314; published July 31, 1945.
Paper, ledger paper, writing paper, and cardboard, Bond. C. M. Rice Paper Company. 218,895; renewed Oct. 5, 1946. O. G. Oct. 8.
Paper, Writing and printing. Keith Paper Company. 424,464; Oct. 8; Serial No. 487,084; published Dec. 25, 1945.

CLASS 38

Journal, Weekly. Towse Publishing Co. 57,008; re-renewed Oct. 30, 1946. O. G. Oct. 8.
Printed books, pamphlets, catalogues, etc. J. S. Bridges. 218,764; renewed Oct. 5, 1946. O. G. Oct. 8.

CLASS 39

Apparel, Knit articles of wearing. Peckham-Foreman Inc. 213,963; renewed June 8, 1946. O. G. Oct. 8.
Apparel, Wearing. C. F. Berg. 215,299; renewed July 13, 1946. O. G. Oct. 8.
Boots and shoes, Leather. Chippewa Shoe Manufacturing Company. 220,130; renewed Nov. 2, 1946. O. G. Oct. 8.
Coats, vests, pants, and overcoats, Men's. Rosenberg Bros. & Co. 218,194; renewed Sept. 21, 1946. O. G. Oct. 8.
Corselets and brassières, Ladies'. Stout Control Foundations Inc. 424,579; Oct. 8.
Gloves with or without leather facings, Knitted and woven fabric. Wells-Lamont Manufacturing Co. 219,164–5; renewed Oct. 12, 1946. O. G. Oct. 8.
Gloves, with or without leather facings, Knitted and woven fabric. Wells-Lamont Manufacturing Co. 219,876; renewed Oct. 26, 1946. O. G. Oct. 8.
Hats, dresses, coats, etc., Ladies' and misses'. Weill & Hartmann. 216,916; renewed Aug. 24, 1946. O. G. Oct. 8.
Hosiery. S. H. Kress & Co. 220,453; renewed Nov. 9, 1946. O. G. Oct. 8.
Hosiery, Ladies'. Artcraft Silk Hosiery Mills, Inc. 214,858; renewed July 6, 1946. O. G. Oct. 8.
Pants, Baby. I. B. Kleinert Rubber Company. 218,193; renewed Sept. 21, 1946. O. G. Oct. 8.
Shirts and blouses, Men's and boys' dress, negligee, and work. Radbord Bros. 219,134; renewed Oct. 12, 1946. O. G. Oct. 8.
Shirts, Sport. Enro Shirt Company, Inc. 214,199; renewed June 15, 1946. O. G. Oct. 8.
Shoes, Canvas, leather, felt, and rubber. American Wholesale Corporation (Baltimore Bargain House). 215,613; renewed July 20, 1946. O. G. Oct. 8.
Sportswear and wearing apparel, Women's and misses' spectator. Baron-Abramson, Inc. 424,580; Oct. 8.
Suits; Bathing shirts, trunks, etc., Bathing. Peckham-Foreman Inc. 213,319; renewed May 25, 1946. O. G. Oct. 8.
Trousers. Joseph H. Cohen & Sons, Vanity Cloths Inc. 219,331; renewed Oct. 19, 1946. O. G. Oct. 8.

CLASS 41

Umbrella-frames of metal. Samuel Foc & Company. 53,902; re-renewed June 12, 1946. O. G. Oct. 8.

CLASS 42

Blankets of cotton and woolen materials. Pendleton Woolen Mills. 215,591; renewed July 20, 1946. O. G. Oct. 8.
Cotton piece goods. Pomona Mills Inc. 220,380; renewed Nov. 9, 1946. O. G. Oct. 8.
Dyed and printed all wool and cotton warp piece goods and dyed and printed cotton piece goods. Pacific Mills. 55,704; re-renewed Aug. 21, 1946. O. G. Oct. 8.
Linen piece goods. Abouchar & Co. 208,704; renewed Feb. 9, 1946. O. G. Oct. 8.
Woolen piece goods. Madison Woolen Co. 220,409; renewed Nov. 9, 1946. O. G. Oct. 8.

CLASS 44

Needles, Hypodermic. Becton, Dickinson & Company. 424,583; Oct. 8.
Serviettes. Thomas Products, Inc. 212,267; renewed Apr. 27, 1946. O. G. Oct. 8.
Vaginal diaphragm inserters. Larré Laboratories. 424,537; Oct. 8; Serial No. 498,066; published July 16, 1946.
Wax. S. S. White Dental Mfg. Co. 53,258; re-renewed June 12, 1946. O. G. Oct. 8.

CLASS 45

Beverages, Nonalcoholic, noncereal, maltless. Broadway Beverage Corporation. 208,425; renewed Feb. 2, 1946. O. G. Oct. 8, 1946.
Water, Bottled. Los Angeles Ice & Cold Storage Company. 215,186; renewed July 13, 1946. O. G. Oct. 8.
Water, Carbonated table or drinking. Canada Dry Ginger Ale, Incorporated. 219,300; renewed Oct. 12, 1946. O. G. Oct. 8.
Water, Distilled. Los Angeles Ice & Cold Storage Co. 215,284; renewed July 13, 1946. O. G. Oct. 8.

CLASS 46

Asparagus, Fresh. Liberty Farms Co. 219,547; renewed Oct. 19, 1946. O. G. Oct. 8.
Bakery products, Certain. Cushman's Sons, Inc. 219,053; renewed Oct. 12, 1946. O. G. Oct. 8.
Bran, bran wafers, bran breakfast food, etc., Washed. Chicago Dietetic Supply House, Inc. 220,019; renewed Oct. 26, 1946. O. G. Oct. 8.

Bicknell, George M.

Carter, Franklyn Y.: *See*—
Dillman, Earnest J., and Carter.

Case, J. I., Company, assignee: *See*—
Leland, Alfred W.
Magee, Kenneth L.

Cavaness, James D., Arlington, Tex. Sucker rod tightener. 2,409,104; Oct. 8.

Celanese Corporation of America, assignee: *See*—
Haney, Clifford I., Martin, and Andrews.

Chaplin, Merle P., South Portland, Maine. Molded fiber edge forming apparatus. 2,408,734; Oct. 8.

Chester Manufacturing Company, assignee: *See*—
Wright, Hal F.

Chicago Eye Shield Company, assignee: *See*—
Malcom, Robert L.

Christian, David A., Batley, assignor to Siemens Brothers & Co. Limited, London, England. Electrical timing arrangement. 2,409,105; Oct. 8.

Cimaglia, Arthur C., Chicago, Ill. Toy gun. 2,408,913; Oct. 8.

Claflin, Roland S., Park Ridge, Ill. Teething device. 2,408,735; Oct. 8.

Clark, Thomas, E. V. Windsor, and L. Hart, assignors to Armstrong Siddeley Motors Limited, Coventry, England. Pressure lubrication system. 2,408,914; Oct. 8.

Codish, George, New York, N. Y. Sole for shoes, slippers, or other articles of footwear. 2,408,736; Oct. 8.

Cody, Clifford S., Springfield, Mass., assignor to Westinghouse Electric Corporation, East Pittsburgh, Pa. Air conditioning apparatus. 2,408,973; Oct. 8.

Conditioned Air Equipment Co., assignee: *See*—
Millott, Arthur T., and Graham.

Cones, Ben, Indianapolis, Ind. Piston. 2,408,915; Oct. 8.

Connelly, Robert T., Duluth, Minn. Scriber. 2,409,106; Oct. 8.

Corey, Warner R., Inkster, Mich. Warning signal 2,409,018; Oct. 8.

Cormier, Louis A., West Hempstead, assignor to Hammel. Riglander & Co. Inc., New York, N. Y. Watchcase tool. 2,408,737; Oct. 8.

Cornwall, Leo W.: *See*—
Gross, Bernard, and Cornwall.

Crabtree, John I.: *See*—
Russell, Harold D., and Crabtree.

Crabtree, John I., and G. T. Eaton, assignors to Eastman Kodak Company, Rochester, N. Y. Processing of certain nongelatin emulsions. 2,409,107; Oct. 8.

Cramer, R. W., Company, Incorporated, assignee: *See*—
Schellens, Eugene L., and Gibbs.

Crawford, William A., Mattoon, Ill., assignor to United Shoe Machinery Corporation, Flemington, N. J. Moccasin sewing machine. 2,408,738; Oct. 8.

Cree, Marion S., Washington, Pa. Template. 2,409,019; Oct. 8.

Crompton & Knowles Loom Works, assignee: *See*—
Turner, Richard G.

Cross, Robert C., Riverside, assignor to Sears, Roebuck and Co., Chicago, Ill. Boiler construction. 2,408,968; Oct. 8.

Cross, Robert C., Riverside, and G. W. Smardon, Lombard, assignors to Sears, Roebuck and Co., Chicago, Ill. Stoker boiler unit. 2,408,969; Oct. 8.

Crot, André, North Hollywood, assignor to Lockheed Aircraft Corporation, Burbank, Calif. Bit sharpener. 2,408,916; Oct. 8.

Crowe, John J., Westfield, N. J., assignor to Air Reduction Company, Incorporated, New York, N. Y. Desulphurizing iron with molten calcium carbide. 2,409,020; Oct. 8.

Crowley, Joseph P., assignor to Libbey-Owens-Ford Glass Company, Toledo, Ohio. Process of forming glass prisms. 2,409,108; Oct. 8.

Crown Cork & Seal Company, Inc., assignee: *See*—
Wilckens, Elbe A., and Magill.

Curtis Pump Company, assignee: *See*—
Curtis, Russell R.

Curtis, Russell R., assignor to Curtis Pump Company, Dayton, Ohio. Slotted throat booster pump. 2,408,918; Oct. 8.

Dale, Loring J. Pie dough former, trimmer, and crimper. 2,409,021; Oct. 8.

Davis, Arnold R., Riverside, Conn., assignor to American Cyanamid Company, New York, N. Y. Diaryl guanidine addition products. 2,409,109; Oct. 8.

Davis, Ernest, assignor to The Prosperity Company, Inc., Syracuse, N. Y. Neck band clamp mechanism. 2,409,110; Oct. 8.

Davis, Tenney L., Norwell, assignor to National Fireworks, Inc., Hanover, Mass. Pyrotechnic devices. 2,409,111; Oct. 8.

Dawes, Rodney, Royal Oak, Mich. Window construction. 2,408,739; Oct. 8.

De Asis, Paul, New York, N. Y. Animal trap. 2,408,740; Oct. 8.

Deere & Company, assignee: *See*—
Rollin, Harvey G.

Delamere Company, Inc., assignee: *See*—
Huppert, William.

Denison Engineering Company, The, assignee: *See*—
Wright, Fred J.

Detroit Lubricator Company, assignee: *See*—
Dillman, Earnest J.

De Verter, Paul L., Baytown, Tex., assignor to Standard Oil Development Company. Motor fuels. 2,409,171; Oct. 8.

Dictaphone Corporation, assignee: *See*—
Yerkovich, Simon.

Diedring, John H., Anderson, Ind., assignor to General Motors Corporation, Detroit, Mich. Safety switch. 2,409,022; Oct. 8.

Dies, Charles A. Making return bend pipe couplings. 2,409,023; Oct. 8.

Dietz, Herbert J., assignor to Eastman Kodak Company, Rochester, N. Y. Luminescent materials. 2,409,174; Oct. 8.

Dildilian, Ara T.: *See*—
Dow, James N., and Dildilian.

Dillman, Earnest J., assignor to Detroit Lubricator Company, Detroit, Mich. Automatic valve. 2,409,112; Oct. 8.

Dillman, Earnest J., and F. Y. Carter, assignors to Detroit Lubricator Company, Detroit, Mich. Refrigeration expansion valve. 2,408,919; Oct. 8.

Dodge, Adiel Y.: *See*—
Swenson, Carl E., and Dodge.

Dodge, William R., Aldan, Pa., assignor to Hajoca Corporation. Self-cleaning straining device. 2,408,741; Oct. 8.

Dornbrook, Frederick L., assignor to Wisconsin Electric Power Company, Milwaukee, Wis. Steam turbine control mechanism. 2,409,024; Oct. 8.

Dougherty, Patrick F.: *See*—
Winn, William E., and Dougherty.

Doumani, Thomas F., Long Beach, and D. A. Skinner, Compton, assignors to Union Oil Company of California, Los Angeles, Calif. Butadiene purification. 2,408,970; Oct. 8.

Dow Chemical Company, The, assignee: *See*—
Nutting, Howard S., and Horsley.

Dow, James N., Longmeadow, Mass., and A. T. Dildilian, Suffield, assignors to Bigelow-Sanford Carpet Co., Inc., Thompsonville, Conn. Pile fabric manufacture. 2,408,756; Oct. 8.

Drake, Alden M., assignor to Niles-Bement-Pond Company, West Hartford, Conn. Gauge lapping machine. 2,409,113; Oct. 8.

Drennan, Harry E., Bartlesville, Okla., assignor to Phillips Petroleum Company. Separating mercaptans. 2,408,920; Oct. 8.

Driver-Harris Company, assignee: *See*—
German, Howard M.

Duncan, Gordon W., Scotch Plains, N. J., assignor to Standard Oil Development Company. Slushing composition. 2,408,971; Oct. 8.

Dunlop, James, Ridgewood, N. J., assignor, by mesne assignments, to Westinghouse Electric Corporation, East Pittsburgh, Pa. Elevator. 2,408,757; Oct. 8.

Dunlop, James, Ridgewood, N. J., assignor, by mesne assignments, to Westinghouse Electric Corporation, East Pittsburgh, Pa. Safety apparatus for elevators. 2,408,758; Oct. 8.

Dunlop, James, Ridgewood, N. J., assignor, by mesne assignments, to Westinghouse Electric Corporation, East Pittsburgh, Pa. Deck-edge elevator. 2,408,759; Oct. 8.

Dunlop, James, Ridgewood, N. J., assignor, by mesne assignments, to Westinghouse Electric Corporation, East Pittsburgh, Pa. Elevator. 2,408,760; Oct. 8.

Dunlop, James, Ridgewood, N. J., and H. E. Hansen, Westerligh, Staten Island, N. Y., assignors, by mesne assignments, to Westinghouse Electric Corporation, East Pittsburgh, Pa. Safety device for elevators. 2,408,761; Oct. 8.

Dunlop, James, Ridgewood, and L. R. Rissler, Hohokus, N. J., assignors, by mesne assignments, to Westinghouse Electric Corporation, East Pittsburgh, Pa. Locking apparatus for elevator platforms. 2,408,762; Oct. 8.

Dunlop, James, Ridgewood, and L. R. Rissler, Hohokus, N. J., assignors, by mesne assignments, to Westinghouse Electric Corporation, East Pittsburgh, Pa. Elevator. 2,408,763; Oct. 8.

Du Pont, E. I., de Nemours & Company, assignee: *See*—
Tauch, Ernest J.
Walker, Joseph F.

Duriron Company, Inc., The, assignee: *See*—
Jacobsen, Oystein.

Eastman Kodak Company, assignee: *See*—
Crabtree, John I., and Eaton.
Dietz, Herbert J.
Kenyon, William O., and Reynolds.
Russell, Harold D., and Crabtree.
Staud, Cyril J.

Eaton, George T.: *See*—
Crabtree, John I., and Eaton.

Eaton, Thomas T., Haddon Heights, N. J., assignor to Radio Corporation of America. Radio system for velocity measurement. 2,408,742; Oct. 8.

Eberhart, Arthur H., Springfield, Mass., assignor to Westinghouse Electric Corporation, East Pittsburgh, Pa. Air conditioning apparatus. 2,408,972; Oct. 8.

Edgerton, Harold E., Belmont, Mass. High-speed flash-photography. 2,408,764; Oct. 8.

Eifel, Joseph, Chicago, Ill. Place marker for books and the like. 2,408,974; Oct. 8.

Elastic Stop Nut Corporation, assignee: *See*—
Mason, Veyne V.

Electrical Engineering and Manufacturing Corporation, assignee: *See*—
Hoover, Valno A.

Elleman, Tom, Port Washington, and R. W. Johnson, Milwaukee, Wis., assignors, by mesne assignments, to The Seng Company, Chicago, Ill. Adjustable chair seat. 2,409,114; Oct. 8.

Elliott, Albert G., Quarndon, Derby, England. Jet-propulsion apparatus for aircraft. 2,408,743; Oct. 8.

Ellis, Delbert, O. L. Taylor, Wilkinsburg, and R. T. Basnett, Edgewood, assignors to Westinghouse Electric Corporation, East Pittsburgh, Pa. Shockproof contactor. 2,409,115; Oct. 8.

Emery Industries, Inc., assignee: *See*—
Stegemeyer, Lou A.

Engel, Karl H., Teaneck, N. J., assignor to Allied Chemical & Dye Corporation, New York, N. Y. Producing esters. 2,408,744; Oct. 8.

Engel, Karl H., West Englewood, N. J., assignor, by mesne assignments, to Allied Chemical & Dye Corporation. Separation of organic bases. 2,408,975; Oct. 8.

Enterprise Railway Equipment Company, assignee: *See*—
Campbell, Argyle.

Erickson, John E., Phoenix, Ariz. Air compressor. 2,408,765; Oct. 8.

Espley, Dennis C., North Wembley, assignor to The General Electric Company Limited, London, England. Variable impedance transformer. 2,408,745; Oct. 8.

Esson, Edwin, assignor to Locke Stove Company, Kansas City, Mo. Stove for burning solid fuels and an ash container therefor. 2,408,921; Oct. 8.

Evans, Theodore W., Oakland, R. C. Morris, Berkeley, and E. C. Shokal, Oakland, assignors to Shell Development Company, San Francisco, Calif. Separation of diolefins by azeotropic distillation. 2,408,922; Oct. 8.

Evert, Ralph W., Detroit, Mich., assignor to United States Rubber Company, New York, N. Y. Apparatus for measuring tires. 2,408,746; Oct. 8.

Falk, Irving M., assignor to The Nu Pocket Method Co., Philadelphia, Pa. Pocket construction for trousers. 2,409,025; Oct. 8.

Fatland, Conrad, Chicago, Ill. Dust mop. 2,408,766; Oct. 8.

Feinstein Knitting Mills, Inc., assignee: *See*—
Feinstein, Louis N.

Feinstein, Louis, assignee, et al.: *See*—
Feinstein, Louis N.

Feinstein, Louis N., Brooklyn, assignor to S., R., and L. Feinstein, doing business as Feinstein Knitting Mills, Inc., New York, N. Y. Knitting machine and method. 2,409,026; Oct. 8.

Feinstein, Rebecca, assignee, et al.: *See*—
Feinstein, Louis N.

Feinstein, Sam, assignee, et al.: *See*—
Feinstein, Louis N.

Felardo, Alfred, Bronx, N. Y. Safety razor blade holder. 2,409,116; Oct. 8.

Fergusson, Alan R., Larchmont, N. Y. Nested serving table. 2,409,027; Oct. 8.

Fero, George G., Newton Upper Falls, Mass., assignor to United-Rexall Drug Company. Store fixture. 2,409,117; Oct. 8.

Filbrun, Everett V., Dayton, Ohio. Mechanical toy. 2,409,028; Oct. 8.

Fink, Lyman R., Schenectady, N. Y., assignor to General Electric Company. Electric valve motor control system. 2,409,029; Oct. 8.

Fisher, George A., Jr.: *See*—
Heath, Robert L., Fisher, and Holbrook.

Fleak, Glen D., Beaumont, Tex. Condiment holder. 2,409,118; Oct. 8.

Fleming, Robert B., Huntington Park, assignor to Bert M. Morris Co., Los Angeles, Calif. Pencil sharpener. 2,408,767; Oct. 8.

Fluchaire, Maurice L. A., Lyon, France; vested in the Alien Property Custodian. Producing solutions of chlorides of polyvinyl. 2,408,769; Oct. 8.

Folland, Donald F.: *See*—
Jenks, Frederic A., and Folland.

Food Machinery Corporation, assignee: *See*—
Halt, James M.
Reynolds, George A., Jr.

Forbragd, John, Garden City, S. Dak. Tire inflating and testing device. 2,408,976; Oct. 8.

Fox, Joseph E., N. A. Nelson, and W. S. Quincy, Jr., Dayton, Ohio. Quartz crystal holder. 2,408,768; Oct. 8.

Fraenckel, Victor H., and S. Hansen, Schenectady, N. Y., assignors to General Electric Company. Light-impulse system. 2,409,030; Oct. 8.

Frank, Clarence E., Fraser, assignor to Briggs Manufacturing Company, Detroit, Mich. Engine. 2,409,031; Oct. 8.

Frankenberg Bros., Inc., assignee: *See*—
Klein, Clarence F.

Frederick, Charles W., Muncie, Ind., assignor to General Motors Corporation, Detroit, Mich. Trap for chips. 2,408,923; Oct. 8.

Freed, Meyer L., Ansonia, assignor to The Seymour Manufacturing Co., Seymour, Conn. Electroplating nickel and cobalt, baths and agents therefor. 2,409,119; Oct. 8.

Freed, Meyer L., Ansonia, and O. A. Stocker, New Haven, assignors to The Seymour Manufacturing Co., Seymour, Conn. Production of bright metallic deposits. 2,409,120; Oct. 8.

Freese, Charles E., Scotia, assignor to General Electric Company, New York, N. Y. Operating mechanism. 2,409,032; Oct. 8.

French, George F., assignor to R. French, Manchester, England. Ladder webbing. 2,408,839; Oct. 8.

French, Roger, assignee: *See*—
French, G. F.

Friedman, Abraham, New York, N. Y. Removable shoulder pad. 2,408,840; Oct. 8.

Frische, Carl A., Great Neck, G. P. Bentley, Garden City, and P. Halpert, Kew Gardens, assignors to Sperry Gyroscope Company, Inc., Brooklyn, N. Y. Electrohydraulic control system. 2,408,770; Oct. 8.

Fritschle, Arthur, University City, Mo., assignor to American Smelting and Refining Company, New York, N. Y. Dumping mechanism for molds. 2,409,121; Oct. 8.

Fritzsch, Frank A., assignor to The Lodge & Shipley Machine Tool Company, Cincinnati, Ohio. Machine tool structure. 2,408,841; Oct. 8.

Fuller, Cyril, assignee: *See*—
Burry, Arthur A.

Galvin Manufacturing Corporation, assignee: *See*—
Magnuski, Henry.
Mitchell, Donald H.
Vogel, William W.

Garceau, Lovett, Holliston, Mass. Electroencephalograph device. 2,409,033; Oct. 8.

Garretson, Owen L., Bartlesville, Okla., T. A. St. Clair, Pontiac, and A. R. Olson, Detroit, Mich., assignors to Phillips Petroleum Company. Automatic cylinder filling device. 2,408,842; Oct. 8.

Gauthier, Marcel C., Montclair, N. J., assignor to Western Electric Company, Incorporated, New York, N. Y. Electrical connector. 2,408,843; Oct. 8.

Gebauer, Adam H., Short Hills, assignor to Tide Water Associated Oil Company, Bayonne, N. J. Treatment of wax-oil mixtures. 2,408,977; Oct. 8.

General Controls Co., assignee: *See*—
Ray, William A.

General Electric Company, assignee: *See*—
Bakke, Hans A.
Bany, Herman.
Fink, Lyman R.
Fraenckel, Victor H., and Hansen.
Freese, Charles E.
Gurewitsch, Anatole M.
Hermann, Benjamin R.
Sias, Frederick R., and Pearson.
Tanis, Hubert E., Jr.
Wall, Alexander C.
Warner, Donald F.

General Electric Company Limited, The, assignee: *See*—
Espley, Dennis Clark.

General Mills, Inc., assignee: *See*—
Borchardt, Lester F.

General Motors Corporation, assignee: *See*—
Diedring, John H.
Frederick, Charles W.
Griffith, Bain.
Heath, Robert L., Fisher, and Holbrook.
MacPherson, Earle S.

General Railway Signal Company, assignee: *See*—
Preston, Nell D.

German, Howard M., East Orange, assignor to Driver-Harris Company, Harrison, N. J. An austenitic chromium-nickel-iron. 2,408,771; Oct. 8.

Gernandt, Waldo G., and A. E. Walden, assignors to Briggs Manufacturing Company, Detroit, Mich. Engine. 2,409,034; Oct. 8.

Gibbs, Norman E.: *See*—
Schellens, Eugene L., and Gibbs.

Gibson Refrigerator Company, assignee: *See*—
Rosebrook, Homer E.

Gill, Emerson C., Melrose, Mass., assignor to United Shoe Machinery Corporation, Flemington, N. J. Holder and positioner for heel parts. 2,408,844; Oct. 8.

Gill, Emerson C., Melrose, Mass., assignor to United Shoe Machinery Corporation, Flemington, N. J. Fastening-inserting machine. 2,408,845; Oct. 8.

Gillings, Charles, and L. J. Murray, Liverpool, England, assignors to Automatic Electric Laboratories, Inc., Chicago, Ill. Crossbar selector switching unit. 2,409,122; Oct. 8.

Gilpin, Garth G., assignor to Standard Railway Equipment Manufacturing Company, Chicago, Ill. Railway car structure. 2,409,035; Oct. 8.

Gisvold, Ole, assignor to Regents of the University of Minnesota, Minneapolis, Minn. Plant extracts and producing same. 2,408,924; Oct. 8.

Glasser, Charles J., Chicago, Ill. Variable density filter attachment for binoculars. 2,408,772; Oct. 8.

Globe, Samuel: *See*—
Hilsenrath, Joseph, and Globe.

Goddard, Robert H., Roswell, N. Mex., assignor of one-half to The Daniel and Florence Guggenheim Foundation, New York, N. Y. Feeding device for combustion chambers. 2,409,036; Oct. 8.

Goddard, Rupert, Havre de Grace, and F. R. Weaver, Edgewood Arsenal, Md. Spray tank for dispersing fluids from aircraft. 2,408,774; Oct. 8.

Golden, Lucius D., and J. K. Gregg, Richmond, assignors to The Perfect Circle Company, Hagerstown, Ind. Antidetonation apparatus for automotive engines. 2,408,846; Oct. 8.

Goldsborough, Shirley L.: *See*—
Mehring, Arthur C., Lensner, and Goldsborough.

Goodall, William M., Oakhurst, N. J., assignor to Bell Telephone Laboratories, Incorporated, New York, N. Y. Position determining system. 2,408,773; Oct. 8.

Goodson, Barrett L.: *See*—
Montgomery, James V., Goodson, and Henry.

Goulding, John P.: *See*—
Lecher, Hans Z., and Goulding.
Lecher, Hans Z., Goulding, and Parker.

Graham, Edmund C.: *See*—
Millott, Arthur T., and Graham.

Graham, John E., Huntingdon, W. Va., assignor to The Watt Car & Wheel Company, Barnesville, Ohio. Buffer and draft gear. 2,408,925; Oct. 8.

Greenwood, Robert P., Youngstown, Ohio, assignor to Pesco Products Co. Booster pump. 2,408,775; Oct. 8.

Gregg, James K.: *See*—
Golden, Lucius D., and Gregg.

Griffith, Bain, assignor to General Motors Corporation, Detroit, Mich. Drive axle. 2,408,926; Oct. 8.

Grilli, John P.: *See*—
Mohr, Albert, Jr., and Grilli.

Griswold, Roger W., II: *See*—
Ludington, Charles T., and Griswold.

Gross, Bernard, and L. W. Cornwall, San Diego, assignors to Rohr Aircraft Corporation, Chula Vista, Calif. Spot-weld edge gauge. 2,408,847; Oct. 8.

Guggenheim, Daniel and Florence, Foundation, The, assignee: *See*—
Goddard, Robert H.

Gurewitsch, Anatole M., Schenectady, N. Y., assignor to General Electric Company. Filtering arrangement. 2,408,927; Oct. 8.

Guth, Frederick A., Denver, Ohio. Door construction. 2,409,037; Oct. 8.

Häger, Bror O., assignor to Bolidens Gruvaktiebolag, Stockholm, Sweden. Wood preservatives. 2,408,978; Oct. 8.

Hait, James M., San Gabriel, assignor to Food Machinery Corporation, San Jose, Calif. Amphibian steering mechanism. 2,408,928; Oct. 8.

Hajoca Corporation, assignee: *See*—
Dodge, William R.

Halpert, Percy: *See*—
Frische, Carl A., Bentley, and Halpert.

Hammel, Riglander & Co., Inc., assignee: *See*—
Cormier, Louis A.

Hammond Instrument Company, assignee: *See*—
Hammond, Laurens, and Hanert.

Hammond, John H., Jr., Gloucester, Mass., assignor to Radio Corporation of America. Navigational guide system. 2,408,848; Oct. 8.

Hammond, Laurens, Chicago, Ill. Steering apparatus. 2,408,929; Oct. 8.

Hammond, Laurens, Chicago, and J. M. Hanert, Wilmette, Ill.; said Hanert assignor to Hammond Instrument Company. Frequency meter. 2,408,930; Oct. 8.

Hanert, John M.: *See*—
Hammond, Laurens, and Hanert.

Haney, Clifford I., Greenwich, Conn., M. E. Martin, and T. M. Andrews, Cumberland, Md., assignors to Celanese Corporation of America. Cellulose purification. 2,408,849; Oct. 8.

Hansell, Clarence W., Port Jefferson, N. Y., assignor to Radio Corporation of America. Magnetron and circuit therefor. 2,409,038; Oct. 8.

Hansen, Hans E.: *See*—
Dunlop, James, and Hansen.

Hansen, Siegfried: *See*—
Fraenckel, Victor H., and Hansen.

Hansen, William W.: *See*—
Varian, Russell H., Hansen, and Woodyard.

Hardy, Edgar E., Anniston, Ala., and G. M. Kosolapoff, Dayton, Ohio, assignors to Monsanto Chemical Company. Halogenated compounds and making same. 2,409,039; Oct. 8.

Harral, Russell L., Jonesboro, Ark. Combination cultivator and row thinner. 2,409,123; Oct. 8.

Harris, Asa J., Balboa, C. Z. Combined sea anchor and stabilizer for boats. 2,409,040; Oct. 8.

Hart, Fred V., Lynn, and L. S. Linderoth, Jr., Marblehead, Mass., assignors, by mesne assignments, to the United States of America, as represented by the Secretary of War. Gun mounting mechanism. 2,409,041; Oct. 8.

Hart, Laurence: *See*—
Clark, Thomas, Windsor, and Hart.

Hawthorne, Wendell P.: *See*—
Woodward, Robert E., Hawthorne, and Meadow.

Heath, Robert L., G. A. Fisher, Jr., and T. R. Holbrook, Indianapolis, Ind., assignors to General Motors Corporation, Detroit, Mich. Stripping lead from bearings. 2,408,931; Oct. 8.

Heins, Harold: *See*—
Biggs, Orrick H., and Heins.

Held, Hans: *See*—
Weits, John, and Held.

Hendley, James A., assignor to The Russell Manufacturing Company, Middletown, Conn. Corded tape. 2,408,850; Oct. 8.

Henry, Robert W.: *See*—
Montgomery, James V., Goodson, and Henry.

Hermann, Benjamin R., Lanesborough, Mass., assignor to General Electric Company. Insulating guard. 2,409,042; Oct. 8.

Heuser, Ralph V., Glenbrook, Conn., assignor to American Cyanamid Company, New York, N. Y. Preparation of acrylonitrile. 2,409,124; Oct. 8.

Hillier, Harold, and T. McAlpine, Cathcart, Glasgow, assignors to G. & J. Weir Limited, Glasgow, Scotland. Pump. 2,408,851; Oct. 8.

Hilsenrath, Joseph, and S. Globe, U. S. Navy. Azimuth computer. 2,408,776; Oct. 8.

Hirsch, Sylvan R., assignor to Brunner Manufacturing Company, Utica, N. Y. Compressor unloader. 2,408,932; Oct. 8.

Hobart Manufacturing Company, The, assignee: *See*—
Meeker, David A., and Allen.

Holbrook, Newton D., Thomaston, Conn. Tripod golf bag. 2,408,777; Oct. 8.

Holbrook, Thomas R.: *See*—
Heath, Robert L., Fisher, and Holbrook.

Holcomb, Harry E.: *See*—
Powell, Edward R., and Holcomb.

Holman, Gustave: *See*—
Holman, William and G.

Holman, William and G., Sheboygan, Wis. Frame corner structure. 2,408,852; Oct. 8.

Holt, Sherman H., Tulsa, Okla. Pump plunger. 2,408,979; Oct. 8.

Hoover Company, The, assignee: *See*—
Acheson, Louis K.
Swann, Edward R.
Troxler, Charles G.

Hoover, Samuel R., Philadelphia, Pa., P. J. Allen, Robles del Rio, Calif., and J. Naghski, Philadelphia, Pa. assignors to United States of America as represented by the Secretary of Agriculture. Guayule rubber by fermentation. 2,408,853; Oct. 8.

Hoover, Vaino A., assignor to Electrical Engineering and Manufacturing Corporation, Los Angeles, Calif. Stator for electric machines. 2,408,854; Oct. 8.

Horsley, Lee H.: *See*—
Nutting, Howard S., and Horsley.

Huebner, William C., New York, N. Y. Image reverser for cameras. 2,408,855; Oct. 8.

Huffman, Hal C.: *See*—
Parker, Robert L., Jr., and Huffman.

Hunt, Rodney, Machine Company, assignee: *See*—
Belcher, Harold H.

Huppert, William, New York, N. Y., assignor to Delamere Company, Inc. Making combs from sheet stock. 2,408,778; Oct. 8.

Hussman, Carl, Chicago, Ill. Vibration absorbing support. 2,408,856; Oct. 8.

Imperial Chemical Industries Limited, assignee: *See*—
Short, Nancy.

Industrial Patents Corporation, assignee: *See*—
Black, Howard C.
Black, Howard C., and Overley.

Inhoffen, Hans H., Berlin-Wilmersdorf, Germany, assignor to Schering Corporation, Bloomfield, N. J. Hydroxylated cyclopentano polyhydrophenanthrene compounds and method of making the same. 2,409,043; Oct. 8.

Interchemical Corporation, assignee: *See*—
Selden, George.

International Standard Electric Corporation, assignee: *See*—
McLarn, Ernest S.

Iverson, John O., assignor to Universal Oil Products Company, Chicago, Ill. Hydrogen fluoride alkylation process. 2,408,933; Oct. 8.

Jacobsen, Oystein, Montgomery County, assignor to The Duriron Company, Inc., Dayton, Ohio. Shaft seal. 2,409,125; Oct. 8.

Jaeger Machine Company, The, assignee: *See*—
Bohmer, Clarence I., and Millikin.

James, Norman L., Ingersoll, Ontario, Canada. Snowplow. 2,408,857; Oct. 8.

Jenks, Frederic A., Mineola, and D. F. Folland, Hempstead, assignors to Sperry Gyroscope Company, Inc., Brooklyn, N. Y. High-frequency coaxial distributor and system. 2,408,779; Oct. 8.

Jerome, Arthur L., Edgewood, assignor to The Union Switch & Signal Company, Swissvale, Pa. Railway signaling apparatus. 2,409,044; Oct. 8.

Johns-Manville Corporation, assignee: *See*—
Powell, Edward R., and Holcomb.

Johnson, Arvin C., assignee: *See*—
Oliver, Charles C.

Johnson, Carl W., Brooklyn, and J. A. Neumair, Hollis, N. Y., assignor to American Machine & Foundry Company. Slip stitching machine. 2,409,045; Oct. 8.

Johnson, Roy W.: *See*—
Elleman, Tom, and Johnson.

Jones, Lloyd B., Hollidaysburg, Pa. Cushioning steam-actuated valves. 2,408,980; Oct. 8.

Kao, Chung-Chin, New York, N. Y. Meteorological recording method and apparatus. 2,408,780; Oct. 8.

Karelius, Albert C., Altadena, Calif. Lathing. 2,408,781; Oct. 8.

Kaufmann, John J., Jr., Greenville, S. C., assignor to Steel Heddle Manufacturing Company, Philadelphia, Pa. Loom shuttle. 2,408,981; Oct. 8.

Kayser, Julius, & Co., assignee: *See*—
Mack, Sterling C.

Keizer, Eugene O., Princeton, N. J., assignor to Radio Corporation of America. Adjustment and testing of crystal rectifiers. 2,408,858; Oct. 8.

Kellogg, M. W., Company, The, assignee: *See*—
Belchetz, Arnold.

Kells, Edward L.: *See*—
Miller, Glen W., Kells, and Larsen.

Kendall Company, The, assignee: *See*—
Whitman, Ross C.

Kennelly, Jeremiah D., Oak Park, Ill. Signal device. 2,409,046; Oct. 8.

Kenyon, William O., and D. D. Reynolds, assignors to Eastman Kodak Company, Rochester, N. Y. Synthetic nitrogenous resins and intermediates therefor. 2,409,126; Oct. 8.

Kienle, Roy H., and C. A. Amick, Bound Brook, N. Y., assignors to American Cyanamid Company, New York, N. Y. Quinonylamino-N-alkylenesulfonic acids as printing aids. 2,409,127; Oct. 8.

Kientz, Louis R. J., Paris; vested in the Alien Property Custodian. Making varnishes. 2,408,782; Oct. 8.

King-Seeley Corporation, assignee: *See*—
Ruby, Thomas M.

Kjellgren, Bengt R. F., University Heights, assignor to The Brush Beryllium Company, Cleveland, Ohio. Recovering beryllium sulphate. 2,408,934; Oct. 8.

Klein, Clarence F., assignor to Frankenberg Bros., Inc., Columbus, Ohio. Paperboard coin box. 2,409,047; Oct. 8.

Kloner, Irving I., Brooklyn, N. Y. Extensible lighting fixture. 2,408,783; Oct. 8.

Koenig, Aaron, Far Rockaway, N. Y. Finger ring construction. 2,408,982; Oct. 8.

Kollen, Myron H., Detroit, Mich., assignor to Union Oil Company of California, Los Angeles, Calif. Composition of matter suitable as a hydraulic fluid. 2,408,983; Oct. 8.

Kosolapoff, Gennady M.: *See*—
Hardy, Edgar E., and Kosolapoff.

Krasberg, Rudolf G., Chicago, Ill. Banding means. 2,409,128; Oct. 8.

Kunst, Neil J., Grand Rapids, Mich. Fire basket. 2,408,935; Oct. 8.

La Mere, Frank J., Minneapolis, Minn. Water closet. 2,409,048; Oct. 8.

Lang Joseph C., assignor to Bocji Corporation, Pittsburgh, Pa. Driver for tilt-top staples. 2,409,049; Oct. 8.

Lange, Henry, assignor to The Quincy Stove Manufacturing Company, Quincy, Ill. Gas burner. 2,409,129; Oct. 8.

Lange, Willy, Cincinnati, Ohio, assignor, by direct and mesne assignments, to Ozark Chemical Company, Tulsa, Okla. Production of anhydrous monofluorophosphoric acid. 2,408,785; Oct. 8.

Lange, Willy, and R. Livingston, Cincinnati, Ohio, assignors, by direct and mesne assignments, to Ozark Chemical Company, Tulsa, Okla. Anhydrous monofluorophosphoric acid and producing it. 2,408,784; Oct. 8.

Larsen, Delmar H.: *See*—
Miller, Glen W., Kells, and Larsen.

Lawson, William E., Sr., Rahway, N. J. Toy pistol. 2,408,984; Oct. 8.

Leake, W. E. Company, Inc., assignee: *See*—
Leake, William E., Jr.

Leake, William E., Jr., Birmingham, Ala., assignor to W. E. Leake Company, Inc. Outdoor cooking apparatus. 2,408,859; Oct. 8.

Lear, Incorporated, assignee: *See*—
Lear, William P.

Lear, William P., Piqua, Ohio, assignor, by mesne assignments, to Lear, Incorporated, Grand Rapids, Mich. Radio azimuth compensator. 2,409,130; Oct. 8.

Lear, William P., North Hollywood, Calif., assignor, by mesne assignments, to Lear, Incorporated, Grand Rapids, Mich. Siren for aircraft. 2,409,131; Oct. 8.

Lear, William P., North Hollywood, Calif., assignor, by mesne assignments, to Lear, Incorporated, Grand Rapids, Mich. Reeling mechanism. 2,409,132; Oct. 8.

Lecher, Hans Z., Plainfield, and J. P. Goulding, Neshanic Station, N. J., assignors to American Cyanamid Company, New York, N. Y. N-substituted derivatives of 5-amino-1,3-benzodioxoles. 2,409,133; Oct. 8.

Lecher, Hans Z., Plainfield, J. P. Goulding, Neshanic Station, and R. P. Parker, Somerville, N. J., assignors to American Cyanamid Company, New York, N. Y. Derivatives of 6-amino-1, 3-benzodioxan. 2,409,134; Oct. 8.

Ledwinka, Joseph, Philadelphia, Pa. Propeller drive with pitch-changing mechanism. 2,409,050; Oct. 8.

Leland, Alfred W., Rockford, Ill., assignor to J. I. Case Company, Racine, Wis. Plow. 2,408,936; Oct. 8.

Leland Stanford Junior University, The Board of Trustees of the, assignee: *See*—
Varian, Russell H., Hansen, and Woodyard.

Lendermon, Homer S., Searcy, Ark. Two-wheeled handle guide tractor. 2,408,937; Oct. 8.

Lensner, Herbert W.: *See*—
Mehring, Arthur C., Lensner, and Goldsborough.

Leonard, Merrill G., Sharon, assignor to Westinghouse Electric Corporation, East Pittsburgh, Pa. Buoyancy control system. 2,409,135; Oct. 8.

Lewis, Lloyd V., Pittsburgh, assignor to The Union Switch & Signal Company, Swissvale, Pa. Remote control system. 2,409,051; Oct. 8.

Libbey-Owen Ford Glass Company, assignee: *See*—
Crowley, Joseph P.

Lilja, Edgar D., assignor to Barber-Colman Company, Rockford, Ill. Condition control. 2,409,136; Oct. 8.

Lindblad, George L., Chicago, Ill. Facial cleaner. 2,408,860; Oct. 8.

Line Material Company, assignee: *See*—
Steinmayer, Alwin G.

Linscott, Leroy N., assignor to Alexander Smith & Sons Carpet Company, Yonkers, N. Y. Loom. 2,408,861; Oct. 8.

Lisota, Edward, Patterson, Calif. Vehicle bed unloading device. 2,408,862; Oct. 8.

Lisota, Edward, Patterson, Calif. Baled hay elevator. 2,408,863; Oct. 8.

Livingston, Ralph: *See*—
Lange, Willy, and Livingston.

Locke Stove Company, assignee: *See*—
Esson, Edwin.

Lockheed Aircraft Corporation, assignee: *See*—
Bloomfield, John J.
Crot, André.

Lodge & Shipley Machine Tool Company, The, assignee: *See*—
Fritzsch, Frank A.

Lombardi, Anthony J., Floral Park, assignor to Sperry Gyroscope Company, Inc., Brooklyn, N. Y. Tuning mechanism. 2,408,786; Oct. 8.

Longbottom, Frank J., Philadelphia, Pa. Flash synchronizer for focal-plane shutters. 2,408,864; Oct. 8.

Longley, Kermit D., Philadelphia, assignor to Quaker Chemical Products Corp., Conshohocken, Pa. Separating tall oil into fractions by treatment with levulinic acid ester. 2,409,137; Oct. 8.

Lowell, Edward O., South Pasadena, assignor, by mesne assignments, to Lowell and Grayson Manufacturing Company, Monrovia, Calif. Inserted tooth milling cutter. 2,408,787; Oct. 8.

Lowell and Grayson Manufacturing Company, assignee: *See*—
Lowell, Edward O.

Ludington, Charles T., Ardmore, Pa., and R. W. Griswold, II, Old Lyme, Conn. Airfoil. 2,408,788; Oct. 8.

Luisada, August G., New York, N. Y. Inflatable boat and making same. 2,408,789; Oct. 8.

Mack, Edward L., New York, N. Y. Razor blade and other cutting tool. 2,408,790; Oct. 8.

Mack, Sterling C., Bangor, Pa., assignor to Julius Kayser & Co., Brooklyn, N. Y. Hosiery. 2,409,138; Oct. 8.

Mackaye, Henry D., Detroit, Mich. Oil burner. 2,408,865; Oct. 8.

MacLean, James M., Detroit, Mich. Wheel. 2,409,052; Oct. 8.

MacPherson, Earle S., assignor to General Motors Corporation, Detroit, Mich. Wheel brake. 2,408,938; Oct. 8.

Madison Manufacturing Company, assignee: *See*—
Steiner, Herman L.

Magee, Kenneth L., Burlington, Iowa, assignor to J. I. Case Company, Racine, Wis. Agricultural machine. 2,408,939; Oct. 8.

Magill, Ellis M.: *See*—
Wilckens, Eibe A., and Magill.

Magnuski, Henry, assignor to Galvin Manufacturing Corporation, Chicago, Ill. Radio communication system. 2,408,791; Oct. 8.

Magnuski, Henry, assignor to Galvin Manufacturing Corporation, Chicago, Ill. Radio receiving system. 2,409,139; Oct. 8.

Mahan, John E., Bartlesville, Okla., assignor to Phillips Petroleum Company. Production of esters. 2,408,940; Oct. 8.

Malcom, Robert L., assignor to Chicago Eye Shield Company, Chicago, Ill. Industrial eyeshield. 2,409,140; Oct. 8.

Mallory, B. L., Company, The, assignee: *See*—
Mallory, Bonnie L.

Mallory, Bonnie L., Cleveland Heights, Ohio, assignor to The B. L. Mallory Company, Hazel Park, Mich. Shock absorber. 2,408,985; Oct. 8.

Mallory, Marion, Detroit, Mich. Engine governor. 2,409,053; Oct. 8.

Margolin, Meyer, Elgin, Ill. Arch support. 2,408,792; Oct. 8.

Margolis, Louis, assignor of five per cent to E. Berger, Washington, D. C. Rotary internal-combustion engine. 2,409,141; Oct. 8.

Marisic, Milton M., Woodbury, and A. C. Schmitt, Wenonah, N. J., assignors to Socony-Vacuum Oil Company, Incorporated. Gel bead. 2,408,986; Oct. 8.

Marquardt, Leonard A., Elmhurst, assignor to W. H. Miner, Inc., Chicago, Ill. Railway car truck. 2,408,866; Oct. 8.

Martin, Mervin E.: *See*—
Haney, Clifford I., Martin, and Andrews.

Marvel Equipment Corporation, assignee: *See*—
Roethel, John H.

Mason, Weyne V., Scotch Plains, assignor to Elastic Stop Nut Corporation, Union, N. J. Manufacture of nuts and the like. 2,408,793; Oct. 8.

Mathieson Alkali Works, Inc., The, assignee: *See*—
Vincent, George P.

Matte, Andrew L., Summit, N. J., assignor to Bell Telephone Laboratories, Incorporated, New York, N. Y. Carrier wave signal system. 2,408,794; Oct. 8.

Matuszak, Maryan P., Bartlesville, Okla., and G. H. Morey, Terre Haute, Ind., assignors to Phillips Petroleum Company. Catalytic process. 2,408,987; Oct. 8.

Mavity, Julian M., and W. E. Moss, assignors to Universal Oil Products Company, Chicago, Ill. Production of isoparaffins. 2,408,941; Oct. 8.

Mawen Motor Corporation, assignee: *See*—
Meyer, André J.

Mayer, Hans: *See*—
Straub, Fritz, Brassel, and Mayer.

McAlpine, Thomas: *See*—
Hillier, Harold, and McAlpine.

McBerty, Frank R., Mansfield, assignor to The North Electric Manufacturing Company, Galion, Ohio. Relay construction. 2,409,054; Oct. 8.

McCann, John J., Lowell, Mass. Making helmet ear muffs. 2,409,055; Oct. 8.

McClain, Herbert K., Wyoming, Ohio, assignor to The Procter and Gamble Company, Ivorydale, Ohio. Soap composition. 2,409,056; Oct. 8.

McCollum, Henry J. D., deceased, Chicago, Ill.; T. McCollum, executrix. Utilizing radiant heat in aircraft. 2,408,867; Oct. 8.

McCollum, Thelma, executrix: *See*—
McCollum, Henry J. D.

McCoy, Clarence E., Western Springs, Ill., assignor to Western Electric Company, Incorporated, New York, N. Y. Molding apparatus. 2,409,142; Oct. 8.

McElhinney, Eric M., and J. A. Podhajsky, Tama County, Iowa. Loader. 2,409,143; Oct. 8.

McElroy, Frank H., Jersey Shore, Pa. Centrifugal type fluid clutch. 2,408,988; Oct. 8.

McGlone, John F., San Diego, Calif. Control means for fluid pressure motors. 2,408,795; Oct. 8.

McGrath, Ellen E.: *See*—
McGrath, Robert A., Sr., and E. E.

McGrath, Robert A., Sr., and E. E., Brooklyn, N. Y. Dowel bar protector. 2,408,989; Oct. 8.

McGraw Electric Company, assignee: *See*—
Osterheld, Clark M.
Scharf, Frank W.

McLarn, Ernest S., Manhasset, assignor to International Standard Electric Corporation, New York, N. Y. Telephone instrument. 2,408,796; Oct. 8.

McPheters, Erwin R., Boise, Idaho. Ore concentrating table. 2,408,797; Oct. 8.

Meadow, Jacob R.: *See*—
Woodward, Robert E., Hawthorne, and Meadow.

Meeker, David A., Troy, and K. C. Allen, Dayton, assignors to The Hobart Manufacturing Company, Troy, Ohio. Scale. 2,408,942; Oct. 8.

Mehring, Arthur C., H. W. Lensner, East Orange, and S. L. Goldsborough, Basking Ridge, N. J., assignors to Westinghouse Electric Corporation, East Pittsburgh, Pa. Carrier-current phase-angle relaying system. 2,408,868; Oct. 8.

Meinert, Richard N., Westfield, N. J., assignor to Standard Oil Development Company. Alkylation of mixed olefins. 2,408,798; Oct. 8.

Meinke, Arthur E., Minneapolis, Minn. Piston. 2,409,057; Oct. 8.

Mekler, Lev A., assignor to Universal Oil Products Company, Chicago, Ill. Conversion of hydrocarbons. 2,408,943; Oct. 8.

Melichar, Joseph F., assignor to The Parker Appliance Company, Cleveland, Ohio. Shuttle valve. 2,408,799; Oct. 8.

Merrell, Wm. S., Company, The, assignee: *See*—
Shelton, Robert S., and Van Campen.

Metal Hydrides Incorporated, assignee: *See*—
Alexander, Peter P.

Meyer, André J., Lexington, Ky., assignor to Mawen Motor Corporation, New York, N. Y. Engine. 2,408,800; Oct. 8.

Michigan Tool Company, assignee: *See*—
Pelphrey, Harry.

Miller, Albert W., Jamaica, N. Y. "C" clamp. 2,408,801; Oct. 8.

Miller, Glen W., Glendale, E. L. Kells, Montrose, and D. H. Larsen, Los Angeles, Calif. Absorption refrigeration cycle. 2,408,802; Oct. 8.

Miller, John H., Short Hills, N. J., assignor to Weston Electrical Instrument Corporation, Newark, N. J. Exposure meter. 2,408,944; Oct. 8.

Miller Pottery Engineering Company, assignee: *See*—
Miller, William J.

Miller, William J., Swissvale, assignor to Miller Pottery Engineering Company, Swissvale, Pittsburgh, Pa. Apparatus for preparing clay for jiggering in the manufacture of potteryware. 2,408,803; Oct. 8.

Miller, William J., Swissvale, assignor to Miller Pottery Engineering Company, Swissvale, Pittsburgh, Pa. Apparatus for manufacturing jiggered potteryware. 2,408,804; Oct. 8.

Miller, William J., Swissvale, assignor to Miller Pottery Engineering Company, Swissvale, Pittsburgh, Pa. Apparatus for the manufacture of potteryware. 2,409,172; Oct. 8.

Millikin, Arnold S.: *See*—
Bohmer, Clarence I., and Millikin.

Millott, Arthur T., and E. C. Graham, assignors to Conditioned Air Equipment Co., Minneapolis, Minn. Refrigerator. 2,408,805; Oct. 8.

Mills, Gillis A., Pikesville, Md. Game. 2,409,144; Oct. 8.

Miner, W. H., Inc., assignee: *See*—
Marquardt, Leonard A.

Mitchell, Donald H., assignor to Galvin Manufacturing Corporation, Chicago, Ill. Control system for wave-signal receivers. 2,409,058; Oct. 8.

Mitchell, John E. M., Parkersburg, W. Va., assignor to Porcelain Products, Inc., Findlay, Ohio. Bushing insulator. 2,408,990; Oct. 8.

Mohr, Albert, Jr., and J. P. Grilli, Chicago, Ill. Blast furnace charging system. 2,408,945; Oct. 8.

Monsanto Chemical Company, assignee: *See*—
Hardy, Edgar E., and Kosolapoff.

Montgomery, James V., Brownwood, Tex., L. B. Goodson, Fort Schuyler, N. Y., and R. W. Henry, Bartlesville, Okla., assignors to Phillips Petroleum Company. Refining mineral oils. 2,409,059; Oct. 8.

Moore, Harold A., Riverhead, N. Y., assignor to Radio Corporation of America. Lightweight masts. 2,409,060; Oct. 8.

Morey, Glen H.: *See*—
Matuszak, Maryan P., and Morey.

Mork, George W., assignor to Bucyrus-Erie Company, South Milwaukee, Wis. Scraper. 2,408,806; Oct. 8.

Morris, Bert M., Co., assignee: *See*—
Fleming, Robert B.

Morris, Frank A., assignor to Stromberg-Carlson Company, Rochester, N. Y. Control and trigger circuit for telephone systems and the like. 2,409,145; Oct. 8.

Morris, Rupert C.: *See*—
Evans, Theodore W., Morris, and Shokal.

Morse, Erwin E.: *See*—
Alston, Paul W., and Morse.

Moss, Walter E.: *See*—
Mavity, Julian M., and Moss.

Motel, John, Cleveland, Ohio. Shutter for fishing nets. 2,409,146; Oct. 8.

Mount Sinai Hospital Research Foundation, Inc., assignee: *See*—
Sobotka, Harry.

Mullen, Thomas W., Evansville, Ind. Towel rack. 2,408,869; Oct. 8.

Mumma, George E., Winnetka, assignor to Sears, Roebuck and Company, Chicago, Ill. Warm air furnace. 2,408,991; Oct. 8.

Murdoch, Robert P., Mount Lebanon, Pa. Aircraft landing gear. 2,408,870; Oct. 8.

Murray, Lawrence J.: *See*—
Gillings, Charles, and Murray.

Naghski, Joseph: *See*—
Hoover, Samuel R., Allen, and Naghski.

Nardone, Romeo M., Teaneck, assignor to Bendix Aviation Corporation, Teterboro, N. J. Landing gear actuator. 2,408,992; Oct. 8.

Nardone, Romeo M., Teaneck, assignor to Bendix Aviation Corporation, Teterboro, N. J. Actuator unit for retractable landing gears. 2,408,993; Oct. 8.

National Automatic Tool Company, Inc., assignee: *See*—
Schafer, Robeft A., and Rodal.

National Fireworks, Inc., assignee: *See*—
Davis, Tenney L.

Nelson, Fred N., assignor to Safety Boat Company, Seattle, Wash. Floating naval base and harbor. 2,408,871; Oct. 8.

Nelson, Harold R., Detroit, Mich. Polishing wheel and cement therefor. 2,408,946; Oct. 8.

Nelson Neil A.: *See*—
Fox, Joseph E., Nelson, and Quincy.

Neuhaus, Elmer C., Chicago, and C. W. Verrill, Hinsdale, Ill., assignors to Western Electric Company, Incorporated, New York, N. Y. Apparatus for forming and assembling articles. 2,409,147; Oct. 8.

Neumair, Joseph A.: *See*—
Johnson, Carl W., and Neumair.

Newbold, Park L., Cedar Rapids, Iowa. Hog trap. 2,408,872; Oct. 8.

Nihon, Alexis, Dorval, Quebec, Canada. Picture frame or the like. 2,408,994; Oct. 8.

Niles-Bement-Pond Company, assignee: *See*—
Drake, Alden M.

Noblett-Sparks Industries, Inc., assignee: *See*—
Booth, Earl C.

Norman, George, assignor to Spalding Knitting Mills, Griffin, Ga. Knitting method and machine. 2,408,807; Oct. 8.

Norris, Richard O., Chicago, Ill., assignor to Sinclair Refining Company, New York, N. Y. Beta-amino, beta-propyl glutaronitriles and preparing them. 2,409,061; Oct. 8.

North Electric Manufacturing Company, The, assignee: *See*—
McBerty, Frank R.

Nu Pocket Method Co., The, assignee: *See*—
Falk, Irving M.

Nutting, Howard S., and L. H. Horsley, assignors to The Dow Chemical Company, Midland, Mich. Azeotropic distillation of aliphatic hydrocarbons having the formulas C_nH_{2n} and C_nH_{2n-2} from hydrocarbon mixtures comprising same. 2,408,947; Oct. 8.

Ocon, Cecilio L., and E. A. Ocon, Yonkers, N. Y.; said Cecilio L. Ocon assignor to said Ernest A. Ocon. Catalytic hydrocarbon reforming process. 2,408,948; Oct. 8.

Ocon, Ernest A.: *See*—
Ocon, Cecilio L., and E. A.

Oliver, Charles C., assignor of one-half to A. C. Johnson, New Orleans, La. Steering column. 2,409,062; Oct. 8.

Olson, Andrew R.: *See*—
Garretson, Owen L., St. Clair, and Olson.

Opheim, Norris B.: *See*—
Pigott, Jack, and Opheim.

Osplack, Joseph J., assignor to Vinco Corporation, Detroit, Mich. Spindle bearing. 2,408,995; Oct. 8.

Osterheld, Clark M., Stoughton, Wis., assignor to McGraw Electric Company, Elgin, Ill. Snap acting thermostatic switch. 2,408,873; Oct. 8.

Osterheld, Clark M., Stoughton, Wis., assignor to McGraw Electric Company, Elgin, Ill. Thermal retarder. 2,408,874; Oct. 8.

Ostline, John E., Chicago, Ill., assignor to Automatic Electric Laboratories, Inc. Telephone system. 2,409,063; Oct. 8.

Overley, Charles A.: *See*—
Black, Howard C., and Overley.

Ozark Chemical Company, assignee: *See*—
Lange, Willy.
Lange, Willy, and Livingston.

Parke, Davis & Company, assignee: *See*—
Wagner, Romeo B.

Parker Appliance Company, The, assignee: *See*—
Melichar, Joseph F.

Parker, Robert L., Jr., South Pasadena, and H. C. Huffman, Long Beach, Calif., assignors to Union Oil Company of California, Los Angeles, Calif. Catalyst rejuvenation. 2,408,996; Oct. 8.

Parker, Robert P.: *See*—
Lecher, Hans Z., Goulding, and Parker.

Parkins, Wright A., West Hartford, assignor to United Aircraft Corporation, East Hartford, Conn. Piston. 2,408,875; Oct. 8.

Parsons, Robert J., Schenectady, N. Y., assignor to Consolidated Car Heating Company, Inc., Albany, N. Y. Damper control. 2,409,064; Oct. 8.

Paulus, Charles L., and R. K. Stout, Dayton, Ohio. Automatic clutch and brake for electric motors and generators. 2,408,808; Oct. 8.

Pearson, Donald B.: *See*—
Sias, Frederick R., and Pearson.

Pelphrey, Harry, assignor to Michigan Tool Company, Detroit, Mich. Hob grinder. 2,408,949; Oct. 8.

Perfect Circle Company, The, assignee: *See*—
Golden, Lucius D., and Gregg.

Pesco Products Co., assignee: *See*—
Greenwood, Robert P.

Peterson, Carl D., and R. R. Burkhalter, Toledo, Ohio. Synchronizing clutch construction. 2,409,148; Oct. 8.

Phillips Petroleum Company, assignee: *See*—
Drennan, Harry E.
Garretson, Owen L., St. Clair, and Olson.
Mahan, John E.
Matuszak, Maryan P., and Morey.
Montgomery, James V., Goodson, and Henry.
Schulze, Walter A., and Alden.

Pierce, John R., assignor to Bell Telephone Laboratories, Incorporated, New York, N. Y. Cathode beam tube and velocity control electrode. 2,408,809; Oct. 8.

Pigott, Jack, and N. B. Opheim, Newport News, Va. Attachment for lathes. 2,408,876; Oct. 8.

Pikul, Joseph H., West Newton, Mass., assignor to The Reece Corporation. Stitch formation. 2,409,149; Oct. 8.

Pinder, Thomas, Scarborough, England. Coupling for model railway vehicles and the like. 2,408,877; Oct. 8.

Pines, Herman, and H. S. Bloch, Riverside, assignors to Universal Oil Products Company, Chicago, Ill. Treatment of hydrocarbons. 2,408,950; Oct. 8.

Plessey Company Limited, The, assignee: *See*—
Pugh, Cyril A.

Podhajsky, James A.: *See*—
McElhinney, Eric M., and Podhajsky.

Pohl, Ernest E., Elmhurst, N. Y., assignor to American Machine & Foundry Company. End labeling mechanism. 2,409,065; Oct. 8.

Pollard, Willard L., Evanston, Ill. Transmission and control therefor. 2,408,951; Oct. 8.

Porcelain Products, Inc., assignee: *See*—
Mitchell, John E. M.

Powell, Edward R., North Plainfield, N. J., and H. E. Holcomb, Stratford, Conn., assignors to Johns-Manville Corporation, New York, N. Y. Manufacture of felted products. 2,409,066; Oct. 8.

Preston, Neil D., assignor to General Railway Signal Company, Rochester, N. Y. Communication system. 2,408,878; Oct. 8.

Procter and Gamble Company, The, assignee: *See*—
McClain, Herbert K.

Prosperity Company, Inc., The, assignee: *See*—
Davis, Ernest.

Puening, Franz, Bethlehem, Pa. Method and apparatus for preparing coal for coking. 2,408,810; Oct. 8.

Pugh, Cyril A., assignor to The Plessey Company Limited, Ilford, England. Carburation apparatus for internal-combustion engines and the like. 2,408,879; Oct. 8.

Pure Oil Company, The, assignee: *See*—
Thacker, Carlisle M., and Bell.

Quaker Chemical Products Corp., assignee: *See*—
Longley, Kermit D.

Quincy Stove Manufacturing Company, The, assignee: *See*—
Lange, Henry.

Quincy, William S., Jr.: *See*—
Fox, Joseph E., Nelson, and Quincy.

Radio Corporation of America, assignee: *See*—
Bliss, Warren H.
Blitz, Daniel.
Eaton, Thomas T.
Hammond, John H., Jr.
Hansell, Clarence W.
Keizer, Eugene O.
Moore, Harold A.
Rettenmeyer, Francis X.
Thompson, Harry C.
Turner, Alfred H.

Raney, Charlie, Brownfield, Tex. Grain handling machine. 2,408,952; Oct. 8.

Rauland Corporation, The, assignee: *See*—
Szegho, Constantin S.

Ray, Joseph E., Denver, Colo. Reed sander. 2,408,953; Oct. 8.

Ray, William A., Glendale, Calif., assignor to General Controls Co. Fuel supply system. 2,408,954; Oct. 8.

Rebers, Paul A., Minneapolis, Minn. Artificial hand. 2,408,880; Oct. 8.

Reece Corporation, The, assignee: *See*—
Pikul, Joseph H.

Reed, Claude A., Omaha, Nebr. Making palatable material. 2,409,067; Oct. 8.

Reed Roller Bit Company, assignee: *See*—
Stokes, John C.

Regents of the University of Minnesota, assignee: *See*—
Gisvold, Ole.

Resk, Michel, New Rochelle, N. Y. Professional photographic camera. 2,408,811; Oct. 8.

Rettenmeyer, Francis X., Moorestown, N. J., assignor to Radio Corporation of America. Ultra high frequency ignition system. 2,408,881; Oct. 8.

Reynolds, Delbert D.: *See*—
Kenyon, William O., and Reynolds.

Reynolds, George A., Jr., Los Angeles, assignor to Food Machinery Corporation, San Jose, Calif. Amphibian steering device. 2,408,955; Oct. 8.

Rhodes, M. H., Inc., assignee: *See*—
Rhodes, Marcus H.

Rhodes, Marcus H., assignor to M. H. Rhodes, Inc., Hartford, Conn. Timing device. 2,408,997; Oct. 8.

Rhodes, Marcus H., assignor to M. H. Rhodes, Inc., Hartford, Conn. Escapement. 2,408,998; Oct. 8.

Rice, Thomas G., Huyton, near Liverpool, England, assignor to Automatic Electric Laboratories, Inc., Chicago, Ill. Electrical circuit employing nonlinear resistance material. 2,409,150; Oct. 8.

Ridbo Laboratories, Inc., assignee: *See*—
Webb, Frederick J.

Rieke, Sidney C., Mission, Tex. Waxing machine. 2,408,812; Oct. 8.

Riggs, Alger S., Washington, D. C., assignor to Sperry Gyroscope Company, Inc., Brooklyn, N. Y. Apparatus for electrical control. 2,408,813; Oct. 8.

Rissler, Lennie R.: *See*—
Dunlop, James, and Rissler.

Robbins, Leo, assignor to Roberts Manufacturing Co., New York, N. Y. Swaging machine. 2,408,882; Oct. 8.

Roberts Manufacturing Co., assignee: *See*—
Robbins, Leo.

Robertson, Anthony E., Roselle, N. J., assignor to Standard Oil Development Company. Motor fuels. 2,408,999; Oct. 8.

Rodal, Ralph B.: *See*—
Schafer, Robert A., and Rodal.

Rode, Fredrich J., Toledo, Ohio, assignor to E. W. Bliss Company, Brooklyn, N. Y. Solenoid controlled valve. 2,408,883; Oct. 8.

Roethel, John H., assignor to Marvel Equipment Corporation, Detroit, Mich. Window regulator. 2,409,068; Oct. 8.

Rogers, Donald H., Jersey City, N. J., assignor to Western Electric Company, Incorporated, New York, N. Y. Electrical regulating device. 2,409,151; Oct. 8.

Rohr Aircraft Corporation, assignee: *See*—
Gross, Bernard, and Cornwall.

Rollin, Harvey G., assignor to Deere & Company, Moline, Ill. Clutch adjusting mechanism. 2,408,884; Oct. 8.

Romain, Fred, Chester, Mont. Horn weight. 2,408,956; Oct. 8.

Romme, William S., Stamford, Conn. Necktie. 2,408,885; Oct. 8.

Rosebrook, Homer E., assignor, by mesne assignments, to Gibson Refrigerator Company, Greenville, Mich. Refrigerator. 2,409,069; Oct. 8.

Rubenstein, Albert, Washington, D. C. Crayon. 2,409,000; Oct. 8.

Ruby, Thomas M., Whitmore Lake, assignor to King-Seeley Corporation, Ann Arbor, Mich. Speed governor. 2,409,070; Oct. 8.

Rundell, Raymond R., Miami, Fla. Swinging bracket. 2,409,152; Oct. 8.

Russell, Harold D., and J. I. Crabtree, assignors to Eastman Kodak Company, Rochester, N. Y. Processing apparatus. 2,409,153; Oct. 8.

Russell Manufacturing Company, The, assignee: *See*—
Hendley, James A.

Safety Boat Company, assignee: *See*—
Nelson, Fred N.

Safety Tank Truck Corporation, assignee: *See*—
Scott, Carlyle H. and P. H.

St. Clair, Theodore A.: *See*—
Garretson, Owen L., St. Clair, and Olson.

Sanders, Sam: *See*—
Steinberger, Harry J., and Sanders.

Schafer, John V., Bronson, Mich. Fishing reel. 2,409,154; Oct. 8.

Schafer, Robert A., and R. B. Rodal, assignors to National Automatic Tool Company, Inc., Richmond, Ind. Remote control apparatus for machine tools. 2,408,957; Oct. 8.

Scharf, Frank W., San Gabriel, Calif., assignor to McGraw Electric Company, Elgin, Ill. Electric iron. 2,408,886; Oct. 8.

Schellens, Eugene L., Essex, and N. E. Gibbs, Old Lyme, assignors to The R. W. Cramer Company, Incorporated, Centerbrook, Conn. Radio transmission apparatus. 2,409,155; Oct. 8.

Schering Corporation, assignee: *See*—
Inhoffen, Hans H.

Schmitt, Arthur C.: *See*—
Marisic, Milton M., and Schmitt.

Schriner, Carl A., assignor of one-half to L. A. Snyder, Defiance, Ohio. Screw driver. 2,408,887; Oct. 8.

Schulze, Walter A., and R. C. Alden, Bartlesville, Okla., assignors to Phillips Petroleum Company. Fuel composition. 2,409,156; Oct. 8.

Schulze, Walter A., and R. C. Alden, Bartlesville, Okla., assignors to Phillips Petroleum Company. Fuel composition. 2,409,157; Oct. 8.

Scott, Carlyle H., Forest Hills, and P. H. Scott, Flushing, assignors to The Safety Tank Truck Corporation, New York, N. Y. Venting and discharge valves for tanks. 2,409,071; Oct. 8.

Scott, Paul H.: *See*—
Scott, Carlyle H. and P. H.

Seagram, Joseph E. & Sons, Inc., assignee: *See*—
Altsheler, William B.

Sears, Roebuck and Co., assignee: *See*—
Cross, Robert C.
Mumma, George E.

Selden, George, Cincinnati, Ohio, assignor to Interchemical Corporation, New York, N. Y. Temporary coating. 2,408,814; Oct. 8.

Seng Company, The, assignee: *See*—
Elleman, Tom, and Johnson.

Seward, Emory A., Evanston, Ill. Sanding block. 2,408,815; Oct. 8.

Seymour Manufacturing Co., assignee: *See*—
Freed, Meyer L.
Freed, Meyer L., and Stocker.

Shallock, Edward W., assignor to American Ore Reclamation Company, Chicago, Ill. Ignition furnace. 2,409,072; Oct. 8.

Shankland, Rodney V.: *See*—
Baillie, James C., and Shankland.

Shapiro, Maurice M., Cabin John, Md. Piezoelectric gauge and making the same. 2,408,816; Oct. 8.

Shell Development Company, assignee: *See*—
Evans, Theodore W., Morris, and Shokal.

Shelton, Robert S., Mariemont, and M. G. Van Campen, Jr., Silverton, Ohio, assignors to The Wm. S. Merrell Company, Cincinnati, Ohio. Esters of dimethylaminoethanol useful as local anesthetics. 2,409,001; Oct. 8.

Shokal, Edward C.: *See*—
Evans, Theodore W., Morris, and Shokal.

Shoop, Charles T., College Point, N. Y. Manicure device. 2,408,888; Oct. 8.

Short, Nancy, Runcorn, England, assignor to Imperial Chemical Industries Limited. Production of organic compounds. 2,408,889; Oct. 8.

Sias, Frederick R., Lynfield Center, and D. B. Pearson, Marblehead, Mass., assignor to General Electric Company. Capacitor fuel gauge. 2,409,073; Oct. 8.

Siemens Brothers & Co. Limited, assignee: *See*—
Christian, David A.

Simpson, John, Jr., and J. Williams, North Tiverton, R. I., assignor to John Simpson, Jr., North Tiverton, R. I. Apparatus for trimming commutators. 2,409,158; Oct. 8.

Sinclair Refining Company, assignee: *See*—
Norris, Richard O.

Singleton, Joseph L., Wauwatosa, Wis., assignor to Allis-Chalmers Manufacturing Company, Milwaukee, Wis. Elastic fluid conditioning apparatus. 2,409,159; Oct. 8.

Sirp, Emil, Downers Grove, Ill., assignor to Western Electric Company, Incorporated, New York, N. Y. Work support. 2,409,160; Oct. 8.

Sivertsen, Jens, Philadelphia, Pa. Bourdon tube. 2,409,161; Oct. 8.

Skinner, Davis A.: *See*—
Doumani, Thomas F., and Skinner.

Smardon, George W.: *See*—
Cross, Robert C., and Smardon.

Smith, Alexander, & Sons Carpet Company, assignee: *See*—
Linscott, Leroy N.

Smith, Edwin G., Mount Lebanon, Pa., assignor, by mesne assignments, to Union Industries, Incorporated, Grantsville, Md. Method and apparatus for supplying pulverized coal and air to furnaces. 2,409,002; Oct. 8.

Smith, William H., Evanston, Ill. Bearing servicing equipment. 2,408,958; Oct. 8.

Snow, Donald L., Hempstead, N. Y., assignor to Sperry Gyroscope Company, Inc. Electron discharge apparatus. 2,408,817; Oct. 8.

Snyder, Lester A., assignee: *See*—
Schriner, Carl A.

Snyder, Roger M., Norfolk County, Va., assignor to The Union Switch and Signal Company, Swissvale, Pa. Drawbridge interlocking. 2,409,074; Oct. 8.

Sobotka, Harry, New York, N. Y., assignor to Mount Sinai Hospital Research Foundation, Inc. Medicated surgical dressings. 2,408,818; Oct. 8.

Society of Chemical Industry in Basle, assignee: *See*—
Straub, Fritz, Brassel, and Mayer.

Socony-Vacuum Oil Company, Incorporated, assignee: *See*—
Marisic, Milton M., and Schmitt.
Woodward, Robert E., Hawthorne, and Meadow.

Soprounoff, Theodore P., New York, N. Y. Internal-combustion engine. 2,408,890; Oct. 8.

Sorensen, Edward M., Dayton, Ohio. Radio remote control system. 2,408,819; Oct. 8.

Spalding Knitting Mills, assignee: *See*—
Norman, George.

Sparks, William N.: *See*—
Baird, William J., and Sparks.

Sperry Gyroscope Company, Inc., assignee: *See*—
Frische, Carl A., Bentley, and Halpert.
Jenks, Frederic A., and Folland.
Lombardi, Anthony J.
Riggs, Alger S.
Snow, Donald L.
Stearns, Horace M.

Sprague Electric Company, assignee: *See*—
Burnham, John.

Stamm, Benjamin I. J., New York, N. Y. Water heater and boiler. 2,408,820; Oct. 8.

Standard Oil Company, assignee: *See*—
Bailie, James C., and Shankland.

Standard Oil Company, The, assignee: *See*—
Burk, Robert E.

Standard Oil Development Company, assignee: *See*—
De Vertér, Paul L.
Duncan, Gordon W.
Meinert, Richard N.
Robertson, Anthony E.
Webber, William O.

Standard Railway Equipment Manufacturing Company, assignee: *See*—
Gilpin, Garth G.
Swann, James S.
Zeidler, Kurt E.

Starck, Arthur M., Stamford, Conn. Extensible stand. 2,409,075; Oct. 8.

Staud, Cyril J., assignor to Eastman Kodak Company, Rochester, N. Y. Photographic material. 2,409,162; Oct. 8.

Stearns, Horace M., Merrick, assignor to Sperry Gyroscope Company, Inc., Brooklyn, N. Y. Automatic volume control. 2,408,821; Oct. 8.

Steel Heddle Manufacturing Company, assignee: *See*—
Kaufmann, John J., Jr.

Stegemeyer, Lou A., assignor to Emery Industries, Inc., Cincinnati, Ohio. Production of primary amines. 2,408,959; Oct. 8.

Steinberger, Harry J., and S. Sanders, Artesia, N. Mex. Swingable road sign. 2,409,076; Oct. 8.

Steiner, Herman L., assignor to Madison Manufacturing Company, Muskegon, Mich. Cutter. 2,408,891; Oct. 8.

Steinmayer, Alwin G., Milwaukee, assignor to Line Material Company, South Milwaukee, Wis. Expulsion fuse. 2,409,077; Oct. 8.

Stever, William, Philadelphia, Pa., assignor to The Budd Company, Philadelphia, Pa. Backing pad for abrasive disks. 2,409,163; Oct. 8.

Stivason, William L., Hamilton Square, N. J., assignor to Whitehead Bros. Rubber Company, Trenton, N. J. Flexible pipe coupling. 2,409,960; Oct. 8.

Stocker, Oscar A.: *See*—
Freed, Meyer L., and Stocker.

Stokes, John C., assignor to Reed Roller Bit Company, Houston, Tex. Slush tube. 2,408,892; Oct. 8.

Stout, Raymond K.: *See*—
Paulus, Charles L., and Stout.

Straub, Fritz, Kaiseraugst, near Basel, J. Brassel, and H. Mayer, assignors to the firm Society of Chemicals Industry in Basle, Basel, Switzerland. Trisazo metallizable dyestuffs. 2,408,961; Oct. 8.

Stromberg-Carlson Company, assignee: *See*—
Morris, Frank A.

Sun Oil Company, assignee: *See*—
Winn, William E., and Dougherty.

Swan, Kenneth C., and N. G. White, Iowa City, Iowa. Choline-like compounds. 2,408,893; Oct. 8.

Swann, Edward R., Floral Park, N. Y., assignor to The Hoover Company, North Canton, Ohio. Suction cleaner. 2,409,078; Oct. 8.

Swann, James S., Homewood, assignor to Standard Railway Equipment Manufacturing Company, Chicago, Ill. Railway car roof structure. 2,409,079; Oct. 8.

Swenson, Carl E., and A. Y. Dodge, Rockford, Ill. One-way clutch and bearing. 2,408,962; Oct. 8.

Swern, Daniel: *See*—
Wells, Percy A., and Swern.

Sylvania Electric Products Inc., assignee: *See*—
Biggs, Orrick H., and Heins.

Szegho, Constantin S., New York, N. Y., assignor to The Rauland Corporation, Chicago, Ill. Electrode. 2,408,894; Oct. 8.

Tanis, Hubert E., Jr., Schenectady, N. Y., assignor to General Electric Company. Electrical discharge device. 2,408,822; Oct. 8.

Tauch, Ernest J., Cleveland Heights, Ohio, assignor to E. I. du Pont de Nemours & Company, Wilmington, Del. Manufacture of sulphamic acid. 2,408,823; Oct. 8.

Taylor, Owen L.: *See*—
Ellis, Delbert, Taylor, and Basnett.

Taylor, Reginald, and G. T. Baker, Liverpool, England, assignors to Automatic Electric Laboratories Inc., Chicago, Ill. Telephone system. 2,409,164; Oct. 8.

Teleregister Corporation, The, assignee: *See*—
Bush, George L.

Teletype Corporation, assignee: *See*—
Burcky, Charles W.

Texaco Development Corporation, assignee: *See*—
Veltman, Preston L.

Thacker, Carlisle M., and Richmond T. Bell, Highland Park, assignors to The Pure Oil Company, Chicago, Ill. Preparation of alkylated cyclic hydrocarbons. 2,409,080; Oct. 8.

Thompson, Harry C., Princeton, N. J., assignor to Radio Corporation of America. Electron discharge device. 2,409,165; Oct. 8.

Thor, Clifford J. B.: *See*—
Bordenca, Carl, and Thor.

Tide Water Associated Oil Company, assignee: *See*—
Gebauer, Adam H.

Torrens, Julia R. W., Lake Jackson, Tex. Ornamental hair curler cover. 2,409,081; Oct. 8.

Tracy, John M., and H. G. Veeder, Loudonville, N. Y. Signal device. 2,409,166; Oct. 8.

Troxler, Charles G., Canton, assignor to The Hoover Company, North Canton, Ohio. Suction cleaner. 2,409,082; Oct. 8.

Turner, Alfred H., Collingswood, N. J., assignor to Radio Corporation of America. Ultra high frequency tuner. 2,408,895; Oct. 8.

Turner, Alfred H., Collingswood, N. J., assignor to Radio Corporation of America. Microwave multiband tuner. 2,408,896; Oct. 8.

Turner, Richard G., assignor to Crompton & Knowles Loom Works, Worcester, Mass. Shuttle with rubber tip. 2,409,003; Oct. 8.

Union Industries, Incorporated, assignee: *See*—
Smith, Edwin G.

Union Oil Company of California, assignee: *See*—
Doumani, Thomas F., and Skinner.
Kollen, Myron H.
Parker, Robert L., Jr., and Huffman.

Union Switch & Signal Company, The, assignee: *See*—
Jerome, Arthur L.
Lewis, Lloyd V.
Snyder, Roger M.

United Aircraft Corporation, assignee: *See*—
Parkins, Wright A.

United-Rexall Drug Company, assignee: *See*—
Fero, George G.

United Shoe Machinery Corporation, assignee: *See*—
Crawford, William A.
Gill, Emerson C.

United States Rubber Company, assignee: *See*—
Evert, Ralph W.

U. S. Slicing Machine Co., assignee: *See*—
Ahrndt, Arthur H.

Universal Oil Products Company, assignee: *See*—
Iverson, John O.
Mavity, Julian M., and Moss.
Mekler, Lev A.
Pines, Herman, and Bloch.

Valverde, Robert, New York, N. Y. Enclosure for bassinets. 2,409,083; Oct. 8.

Van Campen, Marcus G., Jr.: *See*—
Shelton, Robert S., and Van Campen.

Varela, Arthur A., Washington, D. C. Impulse generator. 2,408,824; Oct. 8.

Varian, Russell H., Wantagh, and W. W. Hansen, and J. R. Woodyard, Garden City, N. Y., assignors to The Board of Trustees of the Leland Stanford Junior University, Stanford University, Calif. Object detecting and locating system. 2,408,825; Oct. 8.

Veeder, Harold G.: *See*—
Tracy, John M., and Veeder.

Veltman, Preston L., Port Arthur, Tex., assignor to Texaco Development Corporation, Jersey City, N. J. Motor fuels. 2,409,167; Oct. 8.

Verrill, Charles W.: *See*—
Neuhaus, Elmer C., and Verrill.

Vincent, George P., Poughkeepsie, assignor to The Mathieson Alkali Works, Inc., New York, N. Y. Bleaching and sterilizing starch. 2,409,084; Oct. 8.

Vincent, George P., Briarcliff Manor, assignor to The Mathieson Alkali Works, Inc., New York, N. Y. Starch solubilization. 2,409,085; Oct. 8.

Vinco Corporation, assignee: *See*—
Osplack, Joseph J.

Visking Corporation, The, assignee: *See*—
Bordenca, Carl, and Thor.

Vogel, William W., assignor to Galvin Manufacturing Corporation, Chicago, Ill. Combined frequency modulation radio transmitter and receiver. 2,408,826; Oct. 8.

Wagner, Romeo B., State College, Pa., assignor to Parke, Davis & Company, Detroit, Mich. Steroidal compounds and obtaining the same. 2,408,827; Oct. 8.

Wagner, Romeo B., State College, Pa., assignor to Parke, Davis & Company, Detroit, Mich. Steroidal compounds and obtaining the same. 2,408,828; Oct. 8.

Wagner, Romeo B., State College, Pa., assignor to Parke, Davis & Company, Detroit, Mich. Steroidal compounds and obtaining the same. 2,408,829; Oct. 8.

Wagner, Romeo B., State College, Pa., assignor to Parke, Davis & Company, Detroit, Mich. Steroidal compounds and obtaining the same. 2,408,830; Oct. 8.

Wagner, Romeo B., State College, Pa., assignor to Parke, Davis & Company, Detroit, Mich. Steroidal compounds and obtaining the same. 2,408,831; Oct. 8.

Wagner, Romeo B., State College, Pa., assignor to Parke, Davis & Company, Detroit, Mich. Pseudokryptogenin and its diacetate. 2,408,832; Oct. 8.

Wagner, Romeo B., State College, Pa., assignor to Parke, Davis & Company, Detroit, Mich. Steroidal compounds and obtaining the same. 2,408,833; Oct. 8.

Wagner, Romeo B., State College, Pa., assignor to Parke, Davis & Company, Detroit, Mich. Steroidal compounds and obtaining the same. 2,408,834; Oct. 8.

Wagner, Romeo B., State College, Pa., assignor to Parke, Davis & Company, Detroit, Mich. Steroidal compounds and obtaining the same. 2,408,835; Oct. 8.

Walden, Alfred E.: *See*—
Gernandt, Waldo G., and Walden.

Walker, Joseph F., Lewiston, N. Y., assignor to E. I. du Pont de Nemours & Company, Wilmington, Del. Reaction products of nitriles and aldehydes. 2,409,086; Oct. 8.

Walker, Nevilles E., Portland, Oreg. Distant control. 2,409,168; Oct. 8.

Walker, O. S., Company, Inc., assignee: *See*—
Carson, George J.

Wall, Alexander, Indianapolis, Ind., assignor to General Electric Company. Multicircuit connector. 2,409,004; Oct. 8.

War, United States of America as represented by the Secretary of, assignee: *See*—
Hart, Fred V., and Linderoth.

Warner, Donald F., Swampscott, Mass., assignor to General Electric Company. Barometric fuel valve. 2,408,836; Oct. 8.

Watt Car & Wheel Company, The, assignee: *See*—
Graham, John E.

Weaver, Fleming R.: *See*—
Goddard, Rupert, and Weaver.

Webb, Frederick J., Passaic, assignor to Ridbo Laboratories, Inc., Paterson, N. J. Process for preparing stable rosin esters. 2,409,173; Oct. 8.

Webber, William O., Baytown, Tex., assignor to Standard Oil Development Company. Treating emulsions. 2,409,005; Oct. 8.

Weinberger, Jan V., Truro, Nova Scotia, Canada. Woven cloth. 2,409,087; Oct. 8.

Weir, G. & J., Limited, assignee: *See*—
Hillier, Harold, and McAlpine.

Weits, John, Baldwin, Long Island, and Hans Held, Flushing, N. Y. Device for washing and conditioning air and gases. 2,409,088; Oct. 8.

Wells, Percy A., Abington, and D. Swern, Melrose Park, Pa., assignors to the United States of America, as represented by the Secretary of Agriculture. Derivatives of isoascorbic acid. 2,408,897; Oct. 8.

Westcamp, Leslie L., North Sacramento, Calif. Aircraft landing wheel rotator. 2,408,963; Oct. 8.

Western Electric Company, Incorporated, assignee: *See*—
Gauthier, Marcel C.
McCoy, Clarence E.
Neuhaus, Elmer C., and Verrill.
Rogers, Donald H.
Sirp, Emil.

Westinghouse Electric Corporation, assignee: *See*—
Cody, Clifford S.
Dunlop, James.
Eberhart, Arthur H.
Ellis, Delbert, Taylor, and Basnett.
Leonard, Merrill G.
Mehring, Arthur C., Lensner, and Goldsborough.
Whittaker, Charles C.

Weston Electrical Instrument Corporation, assignee: *See*—
Miller, John H.

White, Norman G.: *See*—
Swan, Kenneth C., and White.

Whitehead Bros. Rubber Company, assignee: *See*—
Stivason, William L.

Whitman, Ross C., Walpole, assignor to The Kendall Company, Boston, Mass. Directionally stiff woven fabric and method. 2,409,089; Oct. 8.

Whittaker, Charles C., Pittsburgh, Pa., assignor to Westinghouse Electric Corporation, East Pittsburgh, Pa. Switching means. 2,408,837; Oct. 8.

Whittaker, Charles C., assignor to Westinghouse Electric Corporation, East Pittsburgh, Pa. Control system for exhausting ballast from torpedoes. 2,409,169; Oct. 8.

Wilckens, Elbe A., and E. M. Magill, assignors to Crown Cork & Seal Company, Inc., Baltimore, Md. Conveyer loading mechanism. 2,408,838; Oct. 8.

Williams, James: *See*—
Simpson, John, Jr., and Williams.

Williams, Russell J.: *See*—
Brady, Charles V., and Williams.

Wilmsen, Joseph, Rushland, Pa. Chenille making machine. 2,408,898; Oct. 8.

Windsor, Edward V.: *See*—
Clark, Thomas, Windsor, and Hart.

Winn, William E., Dallas, Tex., and P. F. Dougherty, Chester, Pa., assignor to Sun Oil Company, Philadelphia, Pa. Logging wells. 2,408,964; Oct. 8.

Winn, William E., Dallas, Tex., and P. F. Dougherty, Chester, Pa., assignor to Sun Oil Company, Philadelphia, Pa. Logging wells. 2,408,965; Oct. 8.

Wisconsin Electric Power Company, assignee: *See*—
Dornbrook, Frederick L.

Woodward, Robert E., Westville, W. P. Hawthorne, Wenonah, N. J., and J. R. Meadow, Memphis, Tenn., assignors to Socony-Vacuum Oil Company, Incorporated. Ethylene alkylation. 2,409,090; Oct. 8.

Woodyard, John R.: *See*—
Varian, Russell H., Hansen, and Woodyard.

Wright, Fred J., assignor to The Denison Engineering Company, Columbus, Ohio. Hydraulic apparatus. 2,409,091; Oct. 8.

Wright, Hal F., assignor to Chester Manufacturing Company, Lisbon, Ohio. Take-up for roller bearings. 2,408,899; Oct. 8.

Yerkovich, Simon, Fairfield, Conn., assignor to Dictaphone Corporation, New York, N. Y. Phonograph. 2,409,006; Oct. 8.

Yolo, Joseph, Yakima, Wash. Splice frog for temporarily joining motion-picture film sections. 2,409,092; Oct. 8.

Young, George W., Bloomfield, N. J. Bank protector. 2,409,007; Oct. 8.

Young, Leonard A., Detroit, Mich. Making garment hangers. 2,409,170; Oct. 8.

Zaccaria, Joseph M., assignee: *See*—
Bocchicchio, Alfeo.

Zeidler, Kurt E., assignor to Standard Railway Equipment Manufacturing Company, Chicago, Ill. Car coupler centering device. 2,409,093; Oct. 8.

LIST OF REISSUE INVENTIONS

FOR WHICH

PATENTS WERE ISSUED ON THE 8TH DAY OF OCTOBER, 1946

NOTE.—Arranged in accordance with the first significant character or word of the name (in accordance with city and telephone directory practice).

Form aligner. W. Hyre. Re. 22,799; Oct. 8.

Hydrocarbons, Catalytic dehydrogenation of. K. K Kearby. Re. 22,800; Oct. 8.

Letter sign, Interchangeable. J. R. Starnes. Re. 22,801; Oct. 8.

LIST OF PLANT INVENTIONS

Rose plant. H. C. Swim. 712; Oct. 8.

LIST OF DESIGN INVENTIONS

Animal figure. W. W. Rodgers. 145,701; Oct. 8.
Bookmark, Clip. E. L. Woodley. 145,705–6; Oct. 8.
Box, Gift. W. B. Petzold. 145,698; Oct. 8.
Cabinet, Lubricating equipment. A. M. Fitzpatrick, Jr. 145,690–2; Oct. 8.
Clip, Money. C. E. Mills. 145,697; Oct. 8.
Costumer, Youth's. J. W. Floyd. 145,693; Oct. 8.
Dispenser, Tape. H. Preble, Jr. 145,699; Oct. 8.
Dress. M. Schneck. 145,703–4; Oct. 8.
Fixture, Fluorescent lighting. N. M. Robboy. 145,700; Oct. 8.
Fixture, Light. C. D. McCann. 145,696; Oct. 8.
Handle for kitchen utensils or similar article. J. H. Chandler. 145,687; Oct. 8.
Register or similar article. M. Sanders. 145,702; Oct. 8.
Shoe. J. K. Eagan. 145,688; Oct. 8.
Stove, Electric. R. Heer. 145,695; Oct. 8.
Tool or similar article, Kitchen. J. H. Chandler and A. J. Eggleston. 145,685–6; Oct. 8.
Tool or similar article, Kitchen. A. J. Eggleston. 145,689; Oct. 8.
Toy, Pull. J. A. Healey. 145,694; Oct. 8.

LIST OF INVENTIONS

FOR WHICH

PATENTS WERE ISSUED ON THE 8TH DAY OF OCTOBER, 1946

NOTE.—Arranged in accordance with the first significant character or word of the name (in accordance with city and telephone directory practice).

Acid and producing it, Anhydrous monofluorophosphoric. W. Lange and R. Livingston. 2,408,784; Oct. 8.
Acid, Manufacture of sulphamic. E. J. Tauch. 2,408,823; Oct. 8.
Acid, Production of anhydrous monofluophosphoric. W. Lange. 2,408,785; Oct. 8.
Acrylonitrile, Preparation of. R. V. Heuser. 2,409,124; Oct. 8.
Actuator, Landing gear. R. M. Nardone. 2,408,992; Oct. 8.
Actuator unit for retractable landing gears. R. M. Nardone. 2,408,993; Oct. 8.
Adjustable chair seat. T. Elleman and R. W. Johnson. 2,409,114; Oct. 8.
Adjusting mechanism, Clutch. H. G. Rollin. 2,408,884; Oct. 8.
Adjustment and testing of crystal rectifiers. E. O. Keizer. 2,408,858; Oct. 8.
Agricultural machine. K. L. Magee. 2,408,939; Oct. 8.
Air conditioning apparatus. C. S. Cody. 2,408,973; Oct. 8.
Air conditioning apparatus. A. H. Eberhart. 2,408,972; Oct. 8.
Aircraft landing gear. R. P. Murdoch. 2,408,870; Oct. 8.
Airfoil. T. C. Ludington and R. W. Griswold. 2,408,788; Oct. 8.
Alkoxy acetals, Making. C. Bordenca and C. J. B. Thor. 2,409,015; Oct. 8.
Alkylated cyclic hydrocarbons, Preparation of. C. M. Thacker and R. T. Bell. 2,409,080; Oct. 8.
Alloy: *See*—
  Austenitic chromium-nickel-iron alloy.
Amines, Production of primary. L. A. Stegemeyer. 2,408,959; Oct. 8.
Amphibian steering mechanism. J. M. Hait. 2,408,928; Oct. 8.
Anchor and stabilizer for boats, Combined sea. A. J. Harris. 2,409,040; Oct. 8.
Animal trap. P. De Asis. 2,408,740; Oct. 8.
Antidetonation apparatus for automotive engines. L. D. Golden and J. K. Gregg. 2,408,846; Oct. 8.
Antirachitic material, Producing. L. F. Borchardt. 2,408,908; Oct. 8.
Apparatus for electrical control. A. S. Riggs. 2,408,813; Oct. 8.
Apparatus for elevator platforms, Locking. J. Dunlop and L. R. Rissler. 2,408,762; Oct. 8.
Apparatus for elevators, Safety. J. Dunlop. 2,408,758; Oct. 8.
Apparatus for forming and assembling articles. E. C. Neuhaus and C. W. Verrill. 2,409,147; Oct. 8.
Apparatus for forming cam surfaces upon cylindrical cam bodies. A. Anderson. 2,408,722; Oct. 8.
Apparatus for manufacturing jiggered potteryware. W. J. Miller. 2,408,804; Oct. 8.
Apparatus for measuring tires. R. W. Evert. 2,408,746; Oct. 8.
Apparatus for preparing clay for jiggering in the manufacture of potteryware. W. J. Miller. 2,408,803; Oct. 8.
Apparatus for the manufacture of potteryware. W. J. Miller. 2,409,172; Oct. 8.
Apparatus for trimming commutators. J. Simpson, Jr., and J. Williams. 2,409,158; Oct. 8.
Arch support. M. Margolin. 2,408,792; Oct. 8.
Attachment for audio receivers. B. A. Alger. 2,408,720; Oct. 8.
Attachment for binoculars, Variable density filter. C. J. Glasser. 2,408,772; Oct. 8.
Attachment for lathes. J. Pigott and N. B. Opheim. 2,408,876; Oct. 8.
Austenitic chromium-nickle-iron alloy. H. M. German. 2,408,771; Oct. 8.
Automatic valve. E. J. Dillman. 2,409,112; Oct. 8.
Automatic volume control. H. M. Stearns. 2,408,821; Oct. 8.
Automobile luggage carrier. J. C. A. Cameron. 2,409,103; Oct. 8.
Axle, Drive. B. Griffith. 2,408,926; Oct. 8.
Azeotropic distillation of aliphatic hydrocarbons having the formulas C_nH_{2n} and C_nH_{2n-2} from hydrocarbon mixtures comprising same. H. S. Nutting and L. H. Horsley. 2,408,947; Oct. 8.
Backing pad for abrasive disks. W. Stever. 2,408,163; Oct. 8.
Bag: *See*—
  Tripod golf bag.
Bag structure and manufacture. C. V. Brady and R. J. Williams. 2,409,100; Oct. 8.
Ballast block. C. C. Ahles. 2,409,094; Oct. 8.
Banding means. R. G. Krasberg. 2,409,128; Oct. 8.
Bank protector. G. W. Young. 2,409,007; Oct. 8.
Barometric fuel valve. D. F. Warner. 2,408,836; Oct. 8.
Base and harbor, Floating naval. F. N. Nelson. 2,408,871; Oct. 8.
Bead, Gel. M. M. Marisic and A. C. Schmitt. 2,408,986; Oct. 8.
Bearing: *See*—
  Spindle bearing.
Beryllium sulphate, Recovering. B. R. F. Kjellgren. 2,408,934; Oct. 8.
Beta-amino, beta-propyl glutaronitriles and preparing them. R. O. Norris. 2,409,061; Oct. 8.
Bleaching and sterilizing starch. G. P. Vincent. 2,409,084; Oct. 8.
Block: *See*—
  Ballast block.
  Sanding block.
Boat and making same, Inflatable. A. G. Luisada. 2,408,789; Oct. 8.
Boiler: *See*—
  Water heater and boiler.
Boiler construction. R. C. Cross. 2,408,968; Oct. 8.
Boiler unit, Stoker. R. C. Cross and G. W. Smardon. 2,408,969; Oct. 8.
Booster pump. R. P. Greenwood. 2,408,775; Oct. 8.
Bourdon tube. J. Sivertsen. 2,409,161; Oct. 8.
Box: *See*—
  Paperboard coin box.
Bracket: *See*—
  Swinging bracket.
Brake: *See*—
  Wheel brake.
Brake cooler. J. J. Bloomfield. 2,409,099; Oct. 8.
Buffer and draft gear. J. E. Graham. 2,408,925; Oct. 8.
Burner: *See*—
  Gas burner.
  Oil burner.
  Retort type oil burner.
Butadiene purification. T. F. Doumani and D. A. Skinner. 2,408,970; Oct. 8.
C clamp. A. W. Miller. 2,408,801; Oct. 8.
Camera, Professional photographic. M. Resk. 2,408,811; Oct. 8.
Capacitor fuel gauge. F. R. Sias and D. B. Pearson. 2,409,073; Oct. 8.
Car structure, Railway. G. G. Gilpin. 2,409,035; Oct. 8.
Carburation apparatus for internal-combustion engines and the like. C. A. Pugh. 2,408,879; Oct. 8.
Carburetor. G. M. Bicknell. 2,408,726; Oct. 8.
Carrier: *See*—
  Automobile luggage carrier
Catalytic hydrocarbon reforming process. C. L. and E. A. Ocon. 2,408,948; Oct. 8.
Catalytic process. M. P. Matuszak and G. H. Morey. 2,408,987; Oct. 8.
Catalyst rejuvenation. R. L. Parker, Jr., and H. C. Huffman. 2,408,996; Oct. 8.
Cathode beam tube and velocity controlled electrode. J. R. Pierce. 2,408,809; Oct. 8.
Cellulose purification. C. I. Haney, M. E. Martin, and T. M. Andrews. 2,408,849; Oct. 8.
Centrifugal type fluid clutch. F. H. McElroy. 2,408,988; Oct. 8.
Charging system, Blast furnace. A. Mohr, Jr., and J. P. Grilli. 2,408,945; Oct. 8.
Chenille making machine. J. Wilmsen. 2,408,898; Oct. 8.
Chlorides of polyvinyl, Producing solutions of. M. L. A. Fluchaire. 2,408,769; Oct. 8.
Choline-like compounds. K. C. Swan and N. G. White. 2,408,893; Oct. 8.
Circular loom. C. A. Caldes. 2,408,732; Oct. 8.
Clamp: *See*—
  C clamp.
Cleaner: *See*—
  Facial cleaner.
  Suction cleaner.
Closet, Water. F. J. La Mere. 2,409,048; Oct. 8.
Cloth, Woven. J. V. Weinberger. 2,409,087; Oct. 8.
Clutch: *See*—
  Centrifugal type fluid clutch.
Clutch and brake for electric motors and generators, Automatic. C. L. Paulus and R. K. Stout. 2,408,808; Oct. 8.
Coal and air to furnaces, Method and apparatus for supplying pulverized. E. G. Smith. 2,409,002; Oct. 8.
Coal for coking, Method and apparatus for preparing. F. Puening. 2,408,810; Oct. 8.
Coal mining apparatus. C. E. Brown. 2,408,967; Oct. 8.
Coating, Temporary. G. Selden. 2,408,814; Oct. 8.

Coaxial distributor and system, High-frequency. F. A. Jenks and D. F. Folland. 2,408,779; Oct. 8.
Color stabilization. H. C. Black. 2,408,904; Oct. 8.
Column, Steering. C. C. Oliver. 2,409,062; Oct. 8.
Combs from sheet stock, Making. W. Huppert. 2,408,778; Oct. 8.
Communication system. N. D. Preston. 2,408,878; Oct. 8.
Composition of matter suitable as a hydraulic fluid. M. H. Kollen. 2,408,983; Oct. 8.
Compressor, Air. J. E. Erickson. 2,408,765; Oct. 8.
Computer, Azimuth. J. Hilsenrath and S. Globe. 2,408,776; Oct. 8.
Condenser: *See*—
Electrical condenser.
Condiment holder. G. D. Fleak. 2,409,118; Oct. 8.
Condition control. E. D. Lilja. 2,409,136; Oct. 8.
Connector: *See*—
Electrical connector. Multicircuit connector.
Container for pencil leads and the like. G. L. Beckstrom. 2,408,902; Oct. 8.
Container or shipping case having a removable cover to be locked and sealed. J. Burger. 2,408,731; Oct. 8.
Control and trigger circuit for telephone systems and the like. F. A. Morris. 2,409,145; Oct. 8.
Control apparatus for machine tools, Remote. R. A. Schafer and R. B. Rodal. 2,408,957; Oct. 8.
Control equipment, Automatic. H. Bany. 2,409,010; Oct. 8.
Control mechanism, Steam turbine. F. L. Dornbrook. 2,409,024; Oct. 8.
Control system, Buoyancy. M. G. Leonard. 2,409,135; Oct. 8.
Control system, Electrohydraulic. C. A. Frische, G. P. Bentley, and P. Halpert. 2,408,770; Oct. 8.
Control system for exhausting ballast from torpedoes. C. C. Whittaker. 2,409,169; Oct. 8.
Control system for wave-signal receivers. D. H. Mitchell. 2,409,058; Oct. 8.
Conveyer loading mechanism. E. A. Wilckens and E. M. Magill. 2,408,838; Oct. 8.
Cooking apparatus, Outdoor. W. E. Leake, Jr. 2,408,859; Oct. 8.
Cooler: *See*—
Brake cooler.
Corner structure, Frame. W. and G. Holman. 2,408,852; Oct. 8.
Coupler centering device, Car. K. E. Zeidler. 2,409,093; Oct. 8.
Coupling: *See*—
Flexible pipe coupling.
Coupling for model railway vehicles and the like. T. Pinder. 2,408,877; Oct. 8.
Couplings, Making return bend pipe. C. A. Dies. 2,409,023; Oct. 8.
Cover: *See*—
Ornamental hair curler cover.
Crayon. A. Rubenstein. 2,409,000; Oct. 8.
Crossbar selector switching unit. C. Gillings and L. J. Murray. 2,409,122; Oct. 8.
Cultivator and row thinner, Combination. R. L. Harral. 2,409,123; Oct. 8.
Cutter: *See*—
Inserted tooth milling cutter.
Cutter. H. L. Steiner. 2,408,891; Oct. 8.
Cutting machine. J. W. Brackett. 2,408,729; Oct. 8.
Damper control. R. J. Parsons. 2,409,064; Oct. 8.
Derivatives of 6-amino-1,3-benzodioxan. H. Z. Lecher, J. P. Goulding, and R. P. Parker. 2,409,134; Oct. 8.
Desulphurizing iron with molten calcium carbide. J. J. Crowe. 2,409,020; Oct. 8.
Device for washing and conditioning air and gases. J. Weits. 2,409,088; Oct. 8.
Diaryl guanidine addition products. A. R. Davis. 2,409,109; Oct. 8.
Diolefins by azeotropic distillation, Separation of. T. W. Evans, R. C. Morris, and E. C. Shokal. 2,408,922; Oct. 8.
Dispensing device for scales, Scoop. A. Bocchicchio. 2,408,906; Oct. 8.
Distant control. N. E. Walker. 2,409,168; Oct. 8.
Door construction. F. A. Guth. 2,409,037; Oct. 8.
Dowel bar protector. R. A., Sr., and E. E. McGrath. 2,408,989; Oct. 8.
Drawbridge interlocking. R. M. Snyder. 2,409,074; Oct. 8.
Drive with magnetic lock, One-way. H. A. Bakke. 2,409,009; Oct. 8.
Driver for tilt-top staples. J. C. Lang. 2,409,049; Oct. 8.
Ear muffs, Making helmet. J. J. McCann. 2,409,055; Oct. 8.
Edge forming apparatus, Molded fibre. M. P. Chaplin. 2,408,734; Oct. 8.
Elastic fluid conditioning apparatus. J. L. Singleton. 2,409,159; Oct. 8.
Electric iron. F. W. Scharf. 2,408,886; Oct. 8.
Electric switch sensitive to small operating movements. A. Arnot. 2,408,901; Oct. 8.
Electrical circuit employing non-linear resistance material. T. G. Rice. 2,409,150; Oct. 8.
Electrical condenser. J. Burnham. 2,408,910; Oct. 8.
Electrical connector. M. C. Gauthier. 2,408,843; Oct. 8.
Electrical discharge device. H. E. Tanis, Jr. 2,408,822; Oct. 8.
Electrical regulating device. D. H. Rogers. 2,409,151; Oct. 8.
Electrode. C. S. Szegho. 2,408,894; Oct. 8.
Electroencephalograph device. L. Garceau. 2,409,033; Oct. 8.
Electrolytic polishing. C. Batcheller. 2,409,097; Oct. 8.
Electron discharge apparatus. D. L. Snow. 2,408,817; Oct. 8.
Electron discharge device. H. C. Thompson. 2,409,165; Oct. 8.
Elevator. J. Dunlop. 2,408,757; Oct. 8.
Elevator. J. Dunlop. 2,408,760; Oct. 8.
Elevator. J. Dunlop and L. R. Rissler. 2,408,763; Oct. 8.
Elevator, Baled hay. E. Lisota. 2,408,863; Oct. 8.
Elevator, Deck-edge. J. Dunlop. 2,408,759; Oct. 8.
Emulsions, Processing of certain nongelatin. J. I. Crabtree and G. T. Eaton. 2,409,107; Oct. 8.
Emulsions, Treating. W. O. Webber. 2,409,005; Oct. 8.
Enclosure for bassinets. R. Valverde. 2,409,083; Oct. 8.
Engine: *See*—
Rotary internal-combustion engine.
Engine. C. E. Frank. 2,409,031; Oct. 8.
Engine. W. G. Gernandt and A. E. Walden. 2,409,034; Oct. 8.
Engine. A. J. Meyer. 2,408,800; Oct. 8.
Escapement. M. H. Rhodes. 2,408,998; Oct. 8.
Esters of dimethylaminoethanol useful as local anesthetics. R. S. Shelton and M. G. Van Campen, Jr. 2,409,001; Oct. 8.
Esters, Producing. K. H. Engel. 2,408,744; Oct. 8.
Esters, Production of. J. E. Mahan. 2,408,940; Oct. 8.
Ethylene alkylation. R. E. Woodward, W. P. Hawthorne, and J. R. Meadow. 2,409,090; Oct. 8.
Exposure meter. J. H. Miller. 2,408,944; Oct. 8.
Extensible stand. A. M. Starck. 2,409,075; Oct. 8.
Eyeshield, Industrial. R. L. Malcom. 2,409,140; Oct. 8.
Fabric articles, Washing and drying. F. H. Berg. 2,408,749; Oct. 8.
Facial cleaner. G. L. Lindblad. 2,408,860; Oct. 8.
Fastening-inserting machine. E. C. Gill. 2,408,845; Oct. 8.
Feeding device for combustion chambers. R. H. Goddard. 2,409,036; Oct. 8.
Felted products, Manufacture of. E. R. Powell and H. E. Holcomb. 2,409,066; Oct. 8.
Filling device, Automatic cylinder. O. L. Garretson, T. A. St. Clair, and A. R. Olson. 2,408,842; Oct. 8.
Filtering arrangement. A. M. Gurewitsch. 2,408,927; Oct. 8.
Finger or hand attachment. V. D. Brittingham. 2,409,101; Oct. 8.
Finger ring construction. A. Koenig. 2,408,982; Oct. 8.
Fire basket. N. J. Kunst. 2,408,935; Oct. 8.
Fishing reel. J. V. Schafer. 2,409,154; Oct. 8.
Fitting. W. C. Buttner. 2,408,912; Oct. 8.
Fixture, Store. G. G. Fero. 2,409,117; Oct. 8.
Flash-photography, High-speed. H. E. Edgerton. 2,408,764; Oct. 8.
Flexible pipe coupling. W. L. Stivason. 2,408,960; Oct. 8.
Fluid pressure motors, Control. J. F. McGlone. 2,408,795; Oct. 8.
Frequency meter. L. Hammond and J. M. Hanert. 2,408,930; Oct. 8.
Fuel composition. W. A. Schulze and R. C. Alden. 2,409,156–7; Oct. 8.
Fuels, Motor. P. L. De Verter. 2,409,171; Oct. 8.
Fuels, Motor. A. E. Robertson. 2,408,999; Oct. 8.
Fuels, Motor. P. L. Veltman. 2,409,167; Oct. 8.
Furnace: *See*—
Ignition furnace. Warm air furnace.
Furniture, Metal. E. C. Booth. 2,408,907; Oct. 8.
Fuse, Expulsion. A. G. Steinmayer. 2,409,077; Oct. 8.
Game. G. A. Mills. 2,409,144; Oct. 8.
Garment hangers, Making. L. A. Young. 2,409,170; Oct. 8.
Gas burner. H. Lange. 2,409,129; Oct. 8.
Gauge: *See*—
Capacitor fuel gauge. Spot-weld edge gauge.
Gauge lapping machine. A. M. Drake. 2,409,113; Oct. 8.
Gear: *See*—
Aircraft landing gear. Buffer and draft gear.
Generator: *See*—
Impulse generator.
Ultra high frequency generator.
Glass prisms, Forming. J. P. Crowley. 2,409,108; Oct. 8.
Glycerides, Preparation of synthetic. H. C. Black and C. A. Overley. 2,408,905; Oct. 8.
Governor, Engine. M. Mallory. 2,409,053; Oct. 8.
Governor, Speed. T. M. Ruby. 2,409,070; Oct. 8.
Grinder, Hob. H. Pelphrey. 2,408,949; Oct. 8.
Guard, Insulating. B. R. Hermann. 2,409,042; Oct. 8.
Guide system, Navigational. J. H. Hammond, Jr. 2,408,848; Oct. 8.

Guiding means. C. W. Burcky. 2,409,102; Oct. 8.
Halogenated compounds and making same. E. E. Hardy and C. M. Kosolapoff. 2,409,039; Oct. 8.
Hand, Artificial. P. A. Rebers. 2,408,880; Oct. 8.
Handling machine, Grain. C. Raney. 2,408,952; Oct. 8.
Hatch for railway cars, Roof. A. Campbell. 2,408,733; Oct. 8.
Hog trap. P. L. Newbold. 2,408,872; Oct. 8.
Holder: *See*—
Condiment holder. Quartz crystal holder.
Magnetic swivel work holder.
Holder and positioner for heel parts. E. C. Gill. 2,408,844; Oct. 8.
Hosiery. S. C. Mack. 2,409,138; Oct. 8.
Hydraulic apparatus. F. J. Wright. 2,409,091; Oct. 8.
Hydrocarbon conversion. A. Belchetz. 2,408,725; Oct. 8.
Hydrocarbons, Conversion of. L. A. Mekler. 2,408,943; Oct. 8.
Hydrocarbons, Preparation of branched chain. R. E. Burk. 2,408,752; Oct. 8.
Hydrocarbons, Treatment of. R. E. Burk. 2,408,753; Oct. 8.
Hydrocarbons, Treatment of. H. Pines and H. S. Bloch. 2,408,950; Oct. 8.
Hydrogen fluoride alkylation process. J. O. Iverson. 2,408,933; Oct. 8.
Hydroxylated cyclopentano polyhydrophenanthrene compounds and making the same. H. H. Inhoffen. 2,409,043; Oct. 8.
Ignition furnace. E. W. Shallock. 2,409,072; Oct. 8.
Ignition system, Ultra high frequency. F. X. Rettenmeyer. 2,408,881; Oct. 8.
Impulse generator. A. A. Varela. 2,408,824; Oct. 8.
Indicator for concrete mixers, Mix-consistency. C. I. Bohmer and A. S. Millikin. 2,409,014; Oct. 8.
Inserted tooth milling cutter. E. O. Lowell. 2,408,787; Oct. 8.
Insulator, Bushing. J. E. M. Mitchell. 2,408,990; Oct. 8.
Internal-combustion engine. T. P. Soprounoff. 2,408,890; Oct. 8.
Iron: *See*—
Electric iron.
Temperature indicating electric iron.
Isoascorbic acid, Derivatives of. P. A. Wells and D. Swern. 2,408,897; Oct. 8.
Isoparaffins, Production of. J. M. Mavity and W. E. Moss. 2,408,941; Oct. 8.
Jet-propulsion apparatus for aircraft. A. G. Elliott. 2,408,743; Oct. 8.
Knitting machine and method. L. N. Feinstein. 2,409,026; Oct. 8.
Knitting method and machine. G. Norman. 2,408,807; Oct. 8.
Labelling mechanism, End. E. E. Pohl. 2,409,065; Oct. 8.
Latching mechanism. H. D. Cahill. 2,408,755; Oct. 8.
Lathing. A. C. Karelius. 2,408,781; Oct. 8.
Lead from bearings, Stripping. R. L. Heath, G. A. Fisher, Jr., and T. R. Holbrook. 2,408,931; Oct. 8.
Light-impulse system. V. H. Fraenckel and S. Hansen. 2,409,030; Oct. 8.
Lighting fixture, Extensible. I. I. Kloner. 2,408,783; Oct. 8.
Liquid-recirculating device, Pneumatically-operated. W. B. Altsheler. 2,408,721; Oct. 8.
Lithium hydride, Production of. P. P. Alexander. 2,408,748; Oct. 8.
Loader. E. M. McElhinney and J. A. Podhajsky. 2,409,143; Oct. 8.
Loom: *See*—
Circular loom.
Loom. L. N. Linscott. 2,408,861; Oct. 8.
Luminescent materials. H. J. Dietz. 2,409,174; Oct. 8.
Magnetic swivel work holder. G. J. Carson. 2,409,017; Oct. 8.
Magnetron and circuit therefor. C. W. Hansell. 2,409,038; Oct. 8.
Manicure device. C. T. Shoop. 2,408,888; Oct. 8.
Marker for books and the like, Place. J. Eifel. 2,408,974; Oct. 8.
Masts, Lightweight. H. A. Moore. 2,409,060; Oct. 8.
Measurement, Circuit time constant. D. Blitz. 2,408,727; Oct. 8.
Meat tendering machine. A. H. Ahrndt. 2,408,747; Oct. 8.
Mechanism for molds, Dumping. A. Fritschle. 2,409,121; Oct. 8.
Mercaptans, Separating. H. E. Drennan. 2,408,920; Oct. 8.
Metallic deposits, Production of bright. M. L. Freed and O. A. Stocker. 2,409,120; Oct. 8.
Meteorological recording method and apparatus. Chung-Chin Kao. 2,408,780; Oct. 8.
Meter: *See*—
Exposure meter. Frequency meter.
Mill: *See*—
Pulling mill.
Molding apparatus. C. E. McCoy. 2,409,142; Oct. 8.
Mop, Dust. C. Fatland. 2,408,766; Oct. 8.
Motor control system, Electric valve. L. R. Fink. 2,409,029; Oct. 8.
Mounting mechanism, Gun. F. V. Hart and L. S. Linderoth, Jr. 2,409,041; Oct. 8.
Multicircuit connector. A. Wall. 2,409,004; Oct. 8.
N-substituted derivatives of 5-amino-1,3-benzodioxoles. H. Z. Lecher and J. P. Goulding. 2,409,133; Oct. 8.
Neck band clamp mechanism. E. Davis. 2,409,110; Oct. 8.
Necktie. W. S. Romme. 2,408,885; Oct. 8.
Nested serving table. A. R. Fergusson. 2,409,027; Oct. 8.
Nickel and cobalt, baths and agents therefor, Electroplating. M. L. Freed. 2,409,119; Oct. 8.
Nitrogenous resins and intermediates therefor, Synthetic. W. O. Kenyon and D. D. Reynolds. 2,409,126; Oct. 8.
Nuts and the like, Manufacture of. V. V. Mason. 2,408,793; Oct. 8.
Object detecting and locating system. R. H. Varian, W. W. Hansen and J. R. Woodyard. 2,408,825; Oct. 8.
Oil burner. H. D. Mackaye. 2,408,865; Oct. 8.
Oils, Refining mineral. J. V. Montgomery, L. B. Goodson, and R. W. Henry. 2,409,059; Oct. 8.
Olefins, Alkylation of mixed. R. N. Meinert. 2,408,798; Oct. 8.
One-way clutch and bearing. C. E. Swenson and A. Y. Dodge. 2,408,962; Oct. 8.
Operating mechanism. C. E. Freese. 2,409,032; Oct. 8.
Ore concentrating table. E. R. McPheters. 2,408,797; Oct. 8.
Organic bases, Separation of. K. H. Engel. 2,408,975; Oct. 8.
Organic compounds, Production of. N. Short. 2,408,889; Oct. 8.
Ornamental hair curler cover. J. R. W. Torrens. 2,409,081; Oct. 8.
Pad: *See*—
Removable shoulder pad.
Palatable material, Making. C. A. Reed. 2,409,067; Oct. 8.
Paperboard coin box. C. F. Klein. 2,409,047; Oct. 8.
Phonograph. S. Yerkovich. 2,409,006; Oct. 8.
Photoelectric transmitting typewriter apparatus. G. L. Bush. 2,408,754; Oct. 8.
Photographic material. C. J. Staud. 2,409,162; Oct. 8.
Picture frame or the like. A. Nihon. 2,408,994; Oct. 8.
Pie dough former, trimmer, and crimper. L. J. Dale. 2,409,021; Oct. 8.
Piezoelectric gauge and making the same. M. M. Shapiro. 2,408,816; Oct. 8.
Pile fabric manufacture. J. N. Dow and A. T. Dildilian. 2,408,756; Oct. 8.
Piston. B. Cones. 2,408,915; Oct. 8.
Piston. A. E. Meinke. 2,409,057; Oct. 8.
Piston. W. A. Parkins. 2,408,875; Oct. 8.
Plant extracts and producing same O. Gisvold. 2,408,924; Oct. 8.
Plastic forming apparatus. W. J. Baird and W. N. Sparks. 2,409,096; Oct. 8.
Plastic molding machine. A. A. Burry. 2,408,911; Oct. 8.
Plow. A. W. Leland. 2,408,936; Oct. 8.
Plunger, Pump. S. H. Holt. 2,408,979; Oct. 8.
Pocket construction for trousers. I. M. Falk. 2,409,025; Oct. 8.
Pocket for hearing aids, Carrying. M. H. Brede. 2,408,966; Oct. 8.
Position determining system. W. M. Goodall. 2,408,773; Oct. 8.
Pressure lubrication system. T. Clark, E. V. Windsor, and L. Hart. 2,408,914; Oct. 8.
Processing apparatus. H. D. Russell and J. I. Crabtree. 2,409,153; Oct. 8.
Propeller drive with pitch-changing mechanism. J. Ledwinka. 2,409,050; Oct. 8.
Protector: *See*—
Bank protector. Dowel bar protector.
Pseudokryptogenin and its diacetate. R. B. Wagner. 2,408,832; Oct. 8.
Pulling mill. H. H. Belcher. 2,409,011; Oct. 8.
Pump: *See*—
Booster pump.
Slotted throat booster pump.
Pump. H. Hillier and T. McAlpine. 2,408,851; Oct. 8.
Purse, Change. H. Breiter and H. Brandon. 2,408,751; Oct. 8.
Pyrotechnic devices. T. L. Davis. 2,409,111; Oct. 8.
Quartz crystal holder. J. E. Fox, N. A. Nelson, and W. S. Quincy. 2,408,768; Oct. 8.
Quinonylamino-N-alkylenesulfonic acids as printing aids. R. H. Kienle and C. A. Amick. 2,409,127; Oct. 8.
Radiant heat in aircraft, Utilizing. H. J. D. McCollum. 2,408,867; Oct. 8.
Radio azimuth compensator. W. P. Lear. 2,409,130; Oct. 8.
Radio communication system. H. Magnuski. 2,408,791; Oct. 8.
Radio receiving system. W. H. Bliss. 2,409,012; Oct. 8.
Radio receiving system. H. Magnuski. 2,409,139; Oct. 8.
Radio remote control system. E. M. Sorensen. 2,408,819; Oct. 8.

Radio system for velocity measurement. T. T. Eaton. 2,408,742; Oct. 8.
Radio transmission apparatus. E. L. Schellens and N. E. Gibbs. 2,409,155; Oct. 8.
Radio transmitter and receiver, Combined frequency modulation. W. W. Vogel. 2,408,826; Oct. 8.
Razor blade and other cutting tool. E. L. Mack. 2,408,790; Oct. 8.
Razor blade holder, Safety. A. Felardo. 2,409,116; Oct. 8.
Reaction products of nitriles and aldehydes. J. F. Walker. 2,409,086; Oct. 8.
Reel: *See*—
Fishing reel.
Reeling mechanism. W. P. Lear. 2,409,132; Oct. 8.
Refrigeration cycle, Absorption. G. W. Miller, E. L. Kells, and D. H. Larsen. 2,408,802; Oct. 8.
Refrigeration expansion valve. E. J. Dillman and F. Y. Carter. 2,408,919; Oct. 8.
Refrigerator. A. T. Millott and E. C. Graham. 2,408,805; Oct. 8.
Refrigerator. H. E. Rosebrook. 2,409,069; Oct. 8.
Regulating device for friction-cone clutches. E. Bodmer. 2,409,013; Oct. 8.
Regulator: *See*—
Window regulator.
Relay construction. F. R. McBerty. 2,409,054; Oct. 8.
Relaying system, Carrier-current phase-angle. A. C Mehring, H. W. Lensner, and S. L. Goldsborough. 2,408,868; Oct. 8.
Remote control system. L. V. Lewis. 2,409,051; Oct. 8.
Removable shoulder pad. A. Friedman. 2,408,840; Oct. 8.
Retarder, Thermal. C. M. Osterheld. 2,408,874; Oct. 8.
Retort type oil burner. E. J. Ashby. 2,409,095; Oct. 8.
Reverser for cameras, Image. W. C. Huebner. 2,408,855; Oct. 8.
Rod and reel assembly, Fishing. J. M. Benson. 2,409,098; Oct. 8.
Roof structure, Railway car. J. S. Swann. 2,409,079; Oct. 8.
Rotary internal-combustion engine. L. Margolis. 2,409,141; Oct. 8.
Rotator, Aircraft landing wheel. L. L. Westcamp. 2,408,963; Oct. 8.
Rubber by fermentation, Guayule. S. R. Hoover, P. J. Allen, and J. Naghski. 2,408,853; Oct. 8.
Safety device for elevators. J. Dunlop and H. E. Hansen. 2,408,761; Oct. 8.
Safety switch. J. H. Diedring. 2,409,022; Oct. 8.
Sander, Reed. J. E. Ray. 2,408,953; Oct. 8.
Sanding block. E. A. Seward. 2,408,815; Oct. 8.
Scale. D. A. Meeker and K. C. Allen. 2,408,942; Oct. 8.
Scraper. G. W. Mork. 2,408,806; Oct. 8.
Screw driver. C. A. Schriner. 2,408,887; Oct. 8.
Scriber. R. T. Connelly. 2,409,106; Oct. 8.
Seal, Annular fluid. O. Brummer. 2,408,909; Oct. 8.
Seat: *See*—
Adjustable chair seat.
Separating tall oil into fractions by treatment with levulinic acid ester. K. D. Longley. 2,409,137; Oct. 8.
Servicing equipment, Bearing. W. H. Smith. 2,408,958; Oct. 8.
Sewing machine, Moccasin. W. A. Crawford. 2,408,738; Oct. 8.
Shaft seal. O. Jacobsen. 2,409,125; Oct. 8.
Sharpener, Bit. A. Crot. 2,408,916; Oct. 8.
Sharpener, Pencil. R. B. Fleming. 2,408,767; Oct. 8.
Shock absorber. B. L. Mallory. 2,408,985; Oct. 8.
Shock-proof contactor. D. Ellis, O. L. Taylor, and R. T. Basnett. 2,409,115; Oct. 8.
Shutter for fishing nets. J. Motel. 2,409,146; Oct. 8.
Shuttle, Loom. J. J. Kaufmann, Jr. 2,408,981; Oct. 8.
Shuttle valve. J. F. Mellichar. 2,408,799; Oct. 8.
Shuttle with rubber tip. R. G. Turner. 2,409,003; Oct. 8.
Sign: *See*—
Swingable road sign.
Signal: *See*—
Warning signal.
Signal device. J. D. Kennelly. 2,409,046; Oct. 8.

Trisazo metallizable dyestuffs. F Straub, J. Brassel, and H. Mayer. 2,408,961; Oct. 8.
Truck, Railway car. L. A. Marquardt. 2,408,866; Oct. 8.
Tube: *See*—
Bourdon tube.
Tuner, Microwave multiband. A. H. Turner. 2,408,896; Oct. 8.
Tuner, Ultra high frequency. A. H. Turner. 2,408,895; Oct. 8.

CLASSIFICATION OF PATENTS

ISSUED OCTOBER 8, 1946

In view of the fact that the issue is being checked weekly by the Classification Division, the class and subclass in this list are correct as of this date. Where there is a discrepancy between the classification given in the patent head and the classification in this list, the classification of this list governs.

NOTE.—First number=class, second number=subclass, third number=patent number

1—	32: 2,408,844	51—	308: 2,408,946	114—	43.5: 2,408,871	172—	239: 2,408,813	209—	458: 2,408,797	257—	9: 2,409,159

U. S. GOVERNMENT PRINTING OFFICE: 1946

Tuning mechanism. A. J. Lombardi. 2,408,786; Oct. 8.
Ultra high frequency generator. O. H. Biggs and H. Heins. 2,408,903; Oct. 8.
Undergarment. L. G. and H. G. Arpin. 2,408,723; Oct. 8.
Unloader, Compressor. S. Hirsch. 2,408,932; Oct. 8.
Unloading device, Vehicle bed. E. Lisota. 2,408,862; Oct. 8.
Valve: *See*—
Automatic valve. Shuttle valve.
Barometric fuel valve..
Refrigeration expansion valve.
Valves for tanks, Venting and discharge. C. H. and P. H. Scott. 2,409,071; Oct. 8.
Varnishes, Making. L. R. J. Kientz. 2,408,782; Oct. 8.
Vibration absorbing support. C. Hussman. 2,408,856; Oct. 8.
Warm air furnace. G. E. Mumma. 2,408,991; Oct. 8.
Warning signal. W. R. Corey. 2,409,018; Oct. 8.
Watchcase tool. L. A. Cormier. 2,408,737; Oct. 8.
Water heater and boiler. B. I. J. Stamm. 2,408,820; Oct. 8.
Wave signal system, Carrier. A. L. Matte. 2,408,794; Oct. 8.
Wax-oil mixtures, Treatment of. A. H. Gebauer. 2,408,977; Oct. 8.
Waxing machine. S. C. Rieke. 2,408,812; Oct. 8.
Webbing, Ladder. G. F. French. 2,408,839; Oct. 8.
Weight, Horn. F. Romain. 2,408,956; Oct. 8.
Wells, Logging. W. E. Winn and P. F. Dougherty. 2,408,964–5; Oct. 8.
Wheel. J. M. MacLean. 2,409,052; Oct. 8.
Wheel and cement therefor, Polishing. H. R. Nelson. 2,408,946; Oct. 8.
Wheel brake. E. S. MacPherson. 2,408,938; Oct. 8.
Window construction. R. Dawes. 2,408,739; Oct. 8.
Window regulator. J. H. Roethel. 2,409,068; Oct. 8.
Wood preservatives. B. O. Häger. 2,408,978; Oct. 8.
Work support. E. Sirp. 2,409,160; Oct. 8.

THE

OFFICIAL GAZETTE

OF THE

United States Patent Office

Vol. 591—No. 3 TUESDAY, OCTOBER 15, 1946 Price—$16 per year

The OFFICIAL GAZETTE is mailed under the direction of the Superintendent of Documents, Government Printing Office, to whom all subscriptions should be made payable and all communications respecting the Gazette should be addressed. Issued weekly. Subscriptions, $16.00 per annum, including annual index, $18.75; single numbers, 25 cents each.

PRINTED COPIES OF PATENTS are furnished by the Patent Office at 25 cents each; copies of TRADE-MARKS and DESIGNS at 10 cents each. Address orders to the Commissioner of Patents, Washington 25, D. C.

CIRCULARS OF GENERAL INFORMATION concerning PATENTS or TRADE-MARKS will be sent without cost on request to the Commissioner of Patents, Washington 25, D. C.

Order No. 5000

U. S. PATENT OFFICE, *Washington 25, D. C., Sept. 25, 1946.*

The membership of the Committee on Enrollment and Disbarment, established by Order No. 3280 on July 9, 1934, is hereby reconstituted as follows:

Leslie Frazer, *Chairman*
Mark Taylor
C. W. Moore
Clerk, Chief Clerk of the Patent Office.

CASPER W. OOMS,
Commissioner.

Disclaimer

2,370,206.—*Elmer H. Taylor,* Newburyport, Mass. CIRCUIT BREAKER. Patent dated Feb. 27, 1945. Disclaimer filed Sept. 12, 1946, by the assignee, *The Chase-Shawmut Company.*

Hereby enters this disclaimer to claims 11 and 12 in said specification.

Notice of Cancellation

U. S. PATENT OFFICE, *Richmond, Va., Sept. 12, 1946.*

William Albert Fitzsimmons, his assigns or legal representatives, take notice:

A petition for cancellation having been filed in this Office by Anna-Jean Yuill, 1 N. La Salle St., Chicago, Ill., to effect the cancellation of trade-mark registration of William Albert Fitzsimmons, 226 W. 11th St., Newport, Ky., No. 263,008, dated October 29, 1929, and the notice of such proceeding sent by registered mail to the said Fitzsimmons at the said address having been returned by the post office undeliverable, notice is hereby given that unless said Fitzsimmons, his assigns or legal representatives, shall enter an appearance therein within thirty days from the first publication of this order the cancellation will be proceeded with as in the case of default. This notice will be published in the OFFICIAL GAZETTE for three consecutive weeks.

LESLIE FRAZER,
First Assistant Commissioner.

Important Information

In ordering manuscript copies much time will be saved if the order states specifically what is desired, viz:

Application as originally filed. (Petition, specification, oath, and drawings, as received.) Application as amended. (Petition, specification, oath, and drawings with amendments entered.)

Application as allowed. (Petition, specification, oath, and drawings as passed by the Examiner for issue.)

Original application. (Facsimile petition, specification, oath, and drawings at present time.)

Specification as originally filed. (As received in Office.)

Specification as amended. (With amendments entered.)

Specification as allowed. (As passed by the Examiner for issue.)

Original specification. (Facsimile at present time.)

File-wrapper. (File-wrapper only.)

File-wrapper and contents. (File-wrapper, contents of record, including photoprints of any tracings or of prints within file-wrapper. In patented cases, printed copy of the specification and drawings of the patent is furnished.)

File-wrapper contents, and drawings. (File-wrapper and all of the contents of record, including photoprints of any tracings, exhibits, or prints within the file-wrapper. In pending cases, photoprints of the pending drawings only, omitting any canceled. If patented, copy of the specification and drawings of the patent being furnished, photoprints are not made of the original drawings unless specially ordered. If canceled drawings are wanted, they must also be specially ordered.)

Assignment. (Give the liber and page of the record as well as the name of the inventor.)

Printed publications in possession of the Office. (Give title and date of publication, also page and exact portion to be copied.)

Orders for copies of any other records not mentioned above must state specifically the exact paper to be copied.

Condition of Applications Under Examination at Close of Business September 27, 1946

(Total number of applications awaiting action, excluding Trade-Mark Division, 125,153; Trade-Mark Division, 10,474. Oldest new case, February 28, 1945; oldest amended, April 3, 1945.)
(The dates given are 1945 except where † indicates 1946.)

DECISIONS IN PATENT AND TRADE-MARK CASES

U. S. Court of Customs and Patent Appeals

IN RE ORRIN WESTON PINEO, DECEASED, AMERICAN CYANAMID COMPANY, ASSIGNEE

No. 5,191. Decided June 11, 1946

[— F.(2d) —; 70 USPQ 230]

PATENTABILITY—OLD COMBINATION.

On affirmance of the rejection of appellant's claims as drawn to the old combination of drive mechanism with spectrophotometer mechanism, *Held* that "the Examiner and the Board were correct in holding that even though the drive mechanism element was new and in itself involved invention this fact alone would not avoid the settled doctrine that if invention rests in an element of a combination an applicant is not entitled to a combination claim involving that element unless the element coacts with the other elements in such a way as to bring about a new, unexpected and beneficial result flowing from such new combination."

APPEAL from the Patent Office. Affirmed.

Mr. Robert Ames Norton (*Mr. Edmund H. Parry, Jr.* of counsel) for Orrin Weston Pineo, Deceased, American Cyanamid Company, Assignee.

Mr. W. W. Cochran (*Mr. E. L. Reynolds* of counsel) for the Commissioner of Patents.

BLAND, *J.:*

The application for a patent involved in this appeal was filed by Orrin Weston Pineo. The application was assigned to the American Cyanamid Company. The said Pineo is deceased.

The claims in the instant application, numbered 6, 7, 8 and 9, relate to improvements in flickering beam spectrophotometers.

Upon appeal from the decision of the Primary Examiner, the Board of Appeals of the United States Patent Office affirmed the action of the Examiner in finally rejecting all of the claims, and it is from the decision of the Board that appellant has here appealed.

Claim 6, which is regarded as illustrative, reads:

6. In a recording spectrophotometer having a movable photometering element linked to a unit of a recording device and operated by a motor in response to light passing through the photometering element and a variable transmission in the linkage between the photometering element and recording unit, the improvement which comprises a cam follower in operative relationship with the photometering element, a rotatable shaft adapted to be shifted laterally, a plurality of cams fixed on the shaft whereby a lateral movement of the cam shaft will bring a selected cam into engagement with the cam follower and means adapted to actuate said recording unit in response to angular rotation of the cam shaft.

In rejecting the four involved claims, the Examiner cited as a reference the deceased Pineo's own patent, No. 2,218,357, October 15, 1940. The Examiner rejected all four claims upon the ground that they were drawn to an old combination, and, in a statement which is so unusually full and clear on the particular issue with which we are here concerned that we feel justified in quoting from it at some length, said:

In the present application, a spectrophotometer of the same general construction as that in the Pineo patent is shown in outline. The specific improvement is in the drive mechanism between the motor 8 and prism 6 (corresponding to motor 14 and prism 16 of the Pineo patent). In this construction, the motor 8 drives shaft 25 which carries a series of cams 26 * * *. To rotate the prism, a push rod 16 is connected to the prism * * * and engages one of the cams. Thus rotation of the cam pushes the rod 16 and rotates the prism 6, the ratio of movement of the shaft 25 and prism 6 depending on the shape of the cam.

The cam shaft 25 may be adjusted longitudinally by knob 50 to selectively position different cams 26 in engagement with the rod 16, a solid portion 40 forming a bearing for the end of the rod when the cams are shifted. Thus when it is desired to shift from one cam to the next, the shaft 25 is turned manually until the portion 40 is in engagement with the rod 16 and the cams 26 are shifted until the selected one is positioned to actuate rod 16.

The claims have been rejected as drawn to an old combination of the variable ratio drive with a spectrophotometer mechanism, as the cooperation of the drive mechanism with the light transmitting apparatus does not differ from the disclosure of Pineo. In drafting these claims, applicant has attempted to avoid the form of combination claims. But as the claims are readable in their entirety only on the complete spectrophotometer mechanism and would require such mechanism for infringement, it is clear that in reality the combination is claimed. See *In re Harris* 510 O. G. 776; 107 F.(2d) 623, wherein the Court of Customs and Patent Appeals held claims of similar form to be drawn to an old combination.

Also, it is clear that applicant considers that the claims are to the combination, as he states that "He created an entirely new spectrophotometer." (Amendment of July 17, 1943.) And in the letter of August 9, 1943, is the statement that "applicant further modified his claims and pointed out that he was not merely claiming an improvement in one element of an old spectrophotometer but, in fact, an entirely new machine."

* * * * * * *

Since the patentability of combination claims is independent of the novelty of the several elements, it may be assumed for purposes of consideration of the combination that the elements themselves are old. The claims may then be tested by determining whether the association of such old elements would be inventive.

Applying this test to the present claims, it may be assumed that the particular variable ratio drive mechanism is old. The light transmitting mechanism is admittedly old, in fact, such mechanism is not even illustrated. But the sole operation of the variable drive mechanism in this combination is to rotate the prism according to the selected function desirable. That is, to drive the prism through a selected cam. This operation is also that of the Pineo patent. Substitution of the drive mechanism shown for that of Pineo may provide a simple and more convenient arrangement for shifting from one drive ratio to another. However, such simplicity and convenience is due solely to the operation of the drive mechanism. Its cooperation with the prism is the same as in the Pineo patent. Therefore such substitution of the present form of drive mechanism for that shown in Pineo does not involve invention and the association of elements shown is not patentable.

When appeal was taken to the Board, it not only affirmed the Examiner's rejection on the ground of old combination but went further and, in its first opinion, expressed the view that all of the elements of the combination in the claim were old and that the Examiner, as they viewed his opinion, had so held. Upon request for reconsideration, the Board reversed itself as to the second ground of rejection and withdrew the same, but affirmed the Examiner's rejection on the ground of old combination.

The law is so well-settled on this question that it would not be helpful here to belabor the issue. It seems clear to us that the Examiner and the Board were correct in holding that even though the drive mechanism element was new and in itself involved invention this fact alone would not avoid the settled doctrine that if invention rests in an element of a combination an applicant is not entitled to a combination claim involving that element unless the element coacts with the other elements in such a way as to bring about a new, un-

expected and beneficial result flowing from such new combination.

There is not any new coaction between the element here stressed by appellant and the other parts of the combination defined in the claims. The new element functions in the old way and even though it may make for an improved machine, the invention, if any, rests clearly in the new element and should have been so defined.

The only improvement that appellant has made, irrespective of whether it is inventive or not, is in the cam mechanism and in nothing else. The following authorities are cited by the Solicitor for the Patent Office, and we think they are pertinent: *Lincoln Engineering Co.* v. *Stewart Warner Corporation*, 303 U. S. 545, 490 O. G. 3; *In re Cook*, 30 C. C. P. A. (Patents) 935, 134 F.(2d) 494, 57 USPQ 120, 552 O. G. 560; *In re Plummer*, 30 C. C. P. A. (Patents) 701, 130 F.(2d) 758, 55 USPQ 130, 545 O. G. 14; *In re Powers*, 29 C. C. P. A. (Patents) 914, 126 F.(2d) 493, 53 USPQ 27, 541 O. G. 459; and *In re Land*, 27 C. C. P. A. (Patents) 863, 109 F.(2d) 246, 44 USPQ 348, 516 O. G. 813.

In *Lincoln Engineering Co.* v. *Stewart Warner Corporation*, supra, the Court stated:

> The improvement of one part of an old combination gives no right to claim that improvement in combination with other old parts which perform no new function in the combination.

In a comparatively recent case decided by this court, *In re Plummer*, supra, it was stated:

> The fact that some elements of a claimed combination are novel and possibly patentable as individual elements does not render the combination containing them patentable in the absence of novel cooperative relation in the combination itself.

Many other authorities might be cited to the same effect, but the law is so well-settled, as is evidenced by the decisions of many courts, particularly during the last decade, that we would not be justified in unduly extending this opinion by further discussing them.

The decision of the Board affirming the action of the Examiner in rejecting the appealed claims upon the ground of old combination is affirmed.

Affirmed.

GARRETT, *P. J.*, sat during the arguments of this case, but because of illness took no part in its consideration or in the decision.

U. S. Court of Customs and Patent Appeals

IN RE LAKE

No. 5,209. Decided June 11, 1946

[— F.(2d) —; 70 USPQ 241]

1. PATENTABILITY—INVENTION.
   "We think the patentee Field's disclosure of the use of acetone as an azeotrope former to separate cyclohexane from an aromatic compound (benzene) would clearly suggest to one skilled in the art that the use of acetone in the azeotropic distillation of a more complex reformed gasoline fraction containing olefins might be effective, and that to try out such a process and discover that it was successful would not involve invention."

2. SAME—SEPARATION OF HYDROCARBONS.
   Claims to a process of separating paraffins and olefins from aromatics in a catalytically reformed gasoline fraction *Held* unpatentable over the prior art.

APPEAL from the Patent Office. Affirmed.

Mr. Sol Shappirio for Lake.

Mr. W. W. Cochran (*Mr. E. L. Reynolds* of counsel) for the Commissioner of Patents.

HATFIELD, *J.:*

This is an appeal from the decision of the Board of Appeals of the United States Patent Office affirming the decision of the Primary Examiner rejecting the claims (Nos. 18 and 19) in appellant's application for a patent for an alleged invention relating to a process of separating, by distillation, hydrocarbons, specifically, paraffins and olefins from aromatics in a catalytically reformed gasoline fraction.

Claim 18 is sufficiently illustrative of the appealed claims, the only difference being that it is broader in that it calls for the separation of paraffin and olefin hydrocarbons from aromatic hydrocarbons, whereas claim 19 is limited to the separation of paraffins and olefins from benzene, one of the aromatic hydrocarbons.

> 18. A process for the treatment of a catalytically reformed gasoline fraction boiling over a range of about 150 and 200° F. to separate paraffins and olefins from aromatics which comprises distilling said fraction boiling between about 150 and 200° F. in the presence of a sufficient amount of acetone to vaporize the paraffins and olefins present with the acetone thereby leaving the aromatics in the residue substantially separated from the other hydrocarbons in the fraction.

The references are: McKittrick, 2,162,963, June 20, 1939; Haltermann (British), 513,566, published November 16, 1939; Field, 2,212,810, August 27, 1940.

It appears from the record that it is difficult to separate hydrocarbons having "small differences in boiling points," and that appellant uses a sufficient amount of acetone which volatilizes the paraffins and olefins with the acetone, leaving the aromatics as a residue.

The claims were rejected by the Primary Examiner on the patent to Field in view of the patents to McKittrick and Haltermann, the Examiner stating that the patent to Field discloses azeotropic distillation of a hydrocarbon fraction having a boiling point of 176° F. with a sufficient amount of acetone (the azeotrope former) to vaporize the paraffin (cyclohexane) present with the acetone, leaving as a residue the aromatic hydrocarbon—benzene. The Examiner also stated that it did not require invention to separate aromatics, specifically benzene (called for by claim 19) from a gasoline fraction by a similar process; that the reference patents to McKittrick and Haltermann disclose the separation of aromatics from petroleum fractions, such as gasoline, "in the presence of an azeotrope former"; that a catalytically formed gasoline is not vitally different from other gasolines which contain olefins and benzene; and that "The gasoline fractions from sources in this country will be substantially free from benzene and olefins unless catalytically reformed. The presence of olefins will necessitate that the oil be more closely fractionated, but McKittrick shows that the olefins and aromatics can be fractionated by azeotropic distillation."

In its decision affirming the decision of the Primary Examiner, the Board of Appeals stated that the addition of large quantities of acetone to the mixture of catalytically reformed gasoline forms an azeotropic mixture of paraffins and olefins having a different boiling point from that of the aromatic hydrocarbons, and that in the distillation process the paraffins and olefins volatilize with the acetone, leaving a residue which is practically a pure aromatic hydrocarbon. The Board called attention to the fact that, as stated by the Primary Examiner, the patent to Field discloses azeotropic distillation of cyclohexane from benzene by the use of an azeotrope former (acetone), and stated that as cyclohexane is usually regarded as an aliphatic compound, it would not involve invention, especially in view of the disclosure in the patent to Haltermann, to use a similar process in azeotropic distillation of a catalytically reformed gasoline fraction, as called for by the appended claims.

The Board was of opinion that the patent to McKittrick was not an especially pertinent reference. Accordingly, we need not discuss it here.

The reference patent to Haltermann discloses a process for the recovery of aromatic hydrocarbons from mixtures of aliphatic, hydroaromatic, and aromatic hydrocarbons by the use of "methanol, ethanol, furfurol, pyridine bases and the like." The patentee states that the hdrocarbons in petroleum tars "and synthetic hydrocarbon mixtures in most cases constitute mixtures of aromatic, hydroaromatic and aliphatic hydrocarbons," and that the aromatic hydrocarbons are the most valuable products of the group. (The aromatic hydrocarbon referred to in the patent is benzene.) The patentee does not state that he uses acetone as an azeotrope former. He states, however, that the "methanol, ethanol, furfurol, pyridine bases and the like" have a "greater dissolving power for the aromatic hydrocarbons than for the hydroaromatic and aliphatic hydrocarbons."

Counsel for appellant concedes in his brief that "acetone is a better solvent for aromatics than it is for aliphatics."

(It may be said at this point that the patentee Haltermann does not mention the presence of olefins in his gasoline fractions. So, the most that the patentee discloses is that it is old to separate the aromatic from the hydroaromatic and aliphatic hydrocarbons by the use of azeotrope formers, although the patentee does not use acetone, the azeotrope former called for by the appealed claims.)

The difference between the disclosure in the Field patent and that alleged in appellant's application is that appellant's process is applied to a catalytically reformed gasoline fraction which includes olefins, whereas the patentee Field discloses the process of removing cyclohexane from an aromatic hydrocarbon (benzene) by the use of an azeotropic former (acetone).

That cyclohexane has the behavior of an aliphatic hydrocarbon, cannot be questioned. See Wertheim "Textbook of Organic Chemistry," page 394.

Counsel for appellant contends that neither the Field patent nor the patent to Haltermann shows the azeotropic distillation of a complex gasoline fraction containing olefins, and that, therefore, neither of those patents suggests the use of acetone in the azeotropic distillation of gasoline containing olefin hydrocarbons for the purpose of isolating aromatic hydrocarbons.

It is true that neither of those reference patents specifically refers to the presence of olefin hydrocarbons. However, it is not contended here by counsel for appellant that olefin hydrocarbons are not aliphatic hydrocarbons.

Aliphatic compounds include "unsaturated compounds, as the ethylene and acetylene series." The olefin hydrocarbon is a "member of the series of unsaturated hydrocarbons of which ethylene is a type." See Webster's New International Dictionary, 1932.

The patentee Field clearly discloses the separation of cyclohexane, which has the behavior of an aliphatic hydrocarbon, from an aromatic compound (benzene) by distillation in the presence of an azeotrope former (acetone).

[1] We think the patentee Field's disclosure of the use of acetone as an azeotrope former to separate cyclohexane from an aromatic compound (benzene) would clearly suggest to one skilled in the art that the use of acetone in the azeotropic distillation of a more complex reformed gasoline fraction containing olefins might be effective, and that to try out such a process and discover that it was successful would not involve invention.

We have given careful consideration to the arguments presented here by counsel for appellant, but are of opinion that the tribunals of the Patent Office reached the right conclusion.

[2] The decision of the Board of Appeals is affirmed.

Affirmed.

GARRETT, *P. J.*, sat during the arguments of this case, but because of illness took no part in its consideration or in the decision.

U. S. Court of Customs and Patent Appeals

IN RE WEST DISINFECTING COMPANY

No. 5,183. Decided June 11, 1946

[— F. (2d) —; 70 USPQ 216]

1. TRADE-MARKS—GOODS OF THE SAME DESCRIPTIVE PROPERTIES.
   The cleaning preparation for rugs, carpets, upholstery and the like, to which appellant applies the mark "Rugfoam," *Held* to be goods of the same descriptive properties as "a concentrated upholstery and rug shampoo having incidental moth-preventative properties," to which the registered trade-mark "Fabrikfoam" is applied.

2. SAME—CONFUSING SIMILARITY.

Held that the marks "Rugfoam" and "Fabrikfoam" differ in appearance and sound, but are practically identical in significance; and that their concurrent use on goods of the same descriptive properties would be likely to cause the confusion, mistake and deceit which the statute prohibits.

APPEAL from the Patent Office. Affirmed.

Messrs. Clarence A. O'Brien & Harvey B. Jacobson (*Mr. C. Ludwell Hyde* and *Mr. Edward Burch* of counsel) for West Disinfecting Company.

Mr. W. W. Cochran (*Mr. Pasquale J. Federico* of counsel) for the Commissioner of Patents.

JACKSON, *J.*:

This is an appeal from a decision of the Commissioner of Patents, 64 USPQ 489, affirming that of the Examiner of Trade-Marks denying registration of "Rugfoam" as a trade-mark applied to a cleaning preparation for rugs, carpets, upholstery and the like. Appellant alleged use of its mark on said goods since June 1941.

The Examiner refused registration of the mark on the ground that it was confusingly similar to the trade-mark "Fabrikfoam," registered March 5, 1935, for use in connection with "a concentrated upholstery and rug shampoo having incidental moth-preventative properties." As a further ground of rejection the Examiner held the mark unregistrable as being descriptive.

Upon appeal the Commissioner affirmed the decision of the Examiner as to the first ground of rejection, but reversed it as to the second ground, holding that the involved terms were highly suggestive but that the expression "Rugfoam" was not descriptive.

The only question to be here decided is whether or not the respective marks are so similar in appearance or significance as to be likely to cause confusion or mistake in the mind of the public or to deceive purchasers when used in connection with the respective goods.

[1][2] It is apparent that the terms "Rugfoam" and "Fabrikfoam" differ in appearance and sound. However, the inference to be drawn from the meaning of both expressions is that both indicate a cleaning preparation for rugs and the like and fabrics and the like. But rugs, generally speaking, are fabrics and nothing more, as was pointed out in the decision of the Commissioner. Therefore we must hold the goods to which the respective marks are applied to possess the same descriptive properties, and since the two terms are practically identical in significance we are of opinion that their concurrent use on the respective goods would be likely to cause the confusion, mistake and deceit which the statute prohibits.

The decision of the Commissioner is affirmed.

Affirmed.

GARRETT, *P. J.*, sat during the arguments of this case, but because of illness took no part in its consideration or in the decision.

Changes in Classification

Order No. 4092, August 28, 1946, directs:

IN THE MANUAL OF CLASSIFICATION:

ABOLISH CLASS

83—MILLS (Division 25).

ABOLISH SUBCLASS

In *class 74, Machine Elements and Mechanisms* (Division 12):

Control lever and linkage systems
Elements
Handles
Shaft connections
549 Yieldable

CHANGE SUBCLASS TITLE

In *class 81, Tools* (Division 29), subclass 15.3 should read:

Repair tools for resilient tires
15.3 Holders for spread tire casings

ESTABLISH SUBCLASSES

In *class 18, Plastics* (Division 15):

2.4 Liquid comminuting and solidifying apparatus
2.5 With fluid blast or stream
2.6 With rotary projection means
2.7 Gravity type
Processes
47.2 Liquid comminuting and solidifying
47.3 With fluid blast or stream

In *class 146, Vegetable and Meat Cutters and Comminutors* (Division 25):

to follow subclass 221

Processes
221.5 Grain hulling by solid work treating agent
221.6 With application of loose abrasive
221.7 With heating, cooling, fluid, or chemical treatment
221.8 Moistening or reaction fluid applied prior to or coincident with hulling action
221.9 With additional subsequent heating, cooling, or fluid applying

to follow subclass 42

250 Grain hullers and scourers; abrasion or impact type
251 Automatic control
252 With loose abradant supplying means
253 With means to project grain into contact with independent hulling surface
254 With grain orienting means
255 With fluid applying means
256 Liquid applying means
257 With means to recirculate gas to material or means to return grain for retreatment
258 Gas borne material applied to perforate hulling zone enclosure
259 Plural hulling zones
260 Material applied to perforate surfaces in plural zones
261 With additional diverse gas applying
262 With means to apply gas both subsequent and prior to hulling operation
263 Gas moving means comprises, or is attached to moving hulling member
264 Gas passes through perforate or sectional rotary inner hulling member
265 Coaxial rotary hulling member and gas moving means
266 Means to apply gas between or within plural hulling zones
267 With additional diverse gas applying
268 Means to apply gas prior to hulling operation
269 Means to apply gas subsequent to hulling operation
270 Plural gas applying means on same material
271 Plural hulling zones
272 With subsequent screen separator
273 Gas moving means comprises, or is attached to, moving hulling member
274 Coaxial rotary hulling member and gas moving means
275 Hulling surface, enclosure or container provided with openings for discharge of material
276 Moving perforate surface
277 Perforate drum-type surface having longitudinal non-perforate hulling portions
278 With non-smooth surface characteristics
279 Cooperating inner member and cylindrical or conical perforate surface
280 With separating means
281 Annular screen surrounding hulling zone or screen integral with moving hulling member
282 With feeding or discharging mechanism or control means
283 Intermittently operated or vibrating feed or discharge means non-rigidly interconnected with moving hulling member
284 Feed or discharge device integral or coaxial with moving hulling member
285 Discharge control valve
286 Combined
287 Plural hulling zones
288 Coaxial or unitary rotary hulling members
289 Circumferential or tangential flow of grain
290 Axial material flow through partitioned hulling drum
291 Endless belt hulling surface
292 Rotary grain moving or hulling member
293 Circumferential or tangential flow of grain
294 With independent grain handling supporting or treating member
295 Rotary cylindrical or conical drum cooperating with independent inner member
296 Plural cooperating rotary members
297 Adjustable or yieldably mounted member
298 Adjustable or yieldable stationary member
299 Hulling surface deformable by contact with grain
300 Stationary cylindrical or conical drum with rotary inner member
301 With intermeshing surface characteristics
302 Horizontal axis
303 With intermeshing surface characteristics
304 Reciprocating hulling member (including oscillating)
305 Hulling elements
306 Radial hulling face
307 Annular internal hulling face
308 Sectional or separable surface elements

In *class 167, Medicines, Poisons, and Cosmetics:*

Medicines (Division 43)
51.5 Sulfa compound containing
Animal extracts
74.5 Urine
74.6 Liver or kidney

In *class 250, Radiant Energy:*

1.50 Reflected and/or otherwise returned wave systems (e. g. object detection, radar) (Division 51)
1.52 Combined with diverse type radiant energy systems
1.54 Utilizing returned signal for control purposes
1.56 Determining velocity of an object
1.58 Combined with determining of direction and/or distance
1.60 Determining distance and direction
1.62 Pulse type
1.64 Determining distance
1.66 Pulse type
1.68 Frequency modulated wave
1.70 Triangulation type
1.72 Determining direction
1.74 Image production
1.76 Reflectors, absorbers, and countermeasures

In *class 254, Pushing and Pulling Implements* (Division 61):

50.1 Resilient tire casing spreaders
50.2 Spreader and tire casing relatively movable or rotatably mounted
50.3 Fluid pressure operated
50.4 With tire casing support

CHANGES IN "CLASSES ARRANGED BY EXAMINING DIVISIONS"

Under Division 10, cancel the matter pertaining thereto and substitute:

250—RADIANT ENERGY, subclasses 14, 16, 21–27, 28–32, 36–40 (See Divisions 51 and 54 for other subclasses).

179—TELEPHONY, subclass 171.5 (See Divisions 16 and 65 for other subclasses).

Under Division 16, in the reference to 179, Telephony, change "51" to *10*.

Under Division 25, cancel:

83—MILLS

Under Division 51, cancel the references to 250, Radiant Energy, and 179, Telephony, and substitute:

250—RADIANT ENERGY, subclasses 1–13, 15, 17–20, 33, 41 (See Divisions 10 and 54 for other subclasses).

Under Division 54, in the reference to 250, Radiant Energy, change the parenthetical phrase to read:

(*See Divisions 10 and 51 for other subclasses*).

Under Division 65, in the reference to 179, Telephony, change "16" and "51" to *10* and *16*.

CHANGES IN "CLASSES ALPHABETICALLY ARRANGED"

On page 10 (1944) cancel:

83—MILLS . . . 25

On page 11 (1942) in the reference to 250, Radiant Energy, before ". . . 51," insert *10,*.
and in the reference to 179, Telephony, cancel "51," and insert *10,*.

CHANGES IN "CLASSES NUMERICALLY ARRANGED"

Cancel:

83—MILLS . . . 25

In the reference to 179, Telephony, cancel "51," and insert *10,*.

In the reference to 250, Radiant Energy, before ". . . 51," insert *10,*.

MISCELLANEOUS CHANGES

On page 256 (1945) in the class title, singularize "Portables".

On page 287 (1945) subclass 64 should be indented under subclass 63.

PRINCIPAL DISPOSITION OF ART FROM ABOLISHED SUBCLASSES

Abolished		Disposition	
Class	Subclass	Class	Subclass
74	549	64	27, 28+

IN THE DEFINITIONS:

8, Bleaching and Dyeing; Fluid Treatment and Chemical Modification of Textiles and Fibers (Division 43)

in subclass 101, under "Search Class", cancel the reference to class 83, Mills.

15, Brushing, Scrubbing and General Cleaning (Division 27)

in the main class definition, in (1) Note, under "Search Class" in the reference to class 146, Vegetable and Meat Cutters and Comminutors, insert prior to the word "comminuting," *peeling, hulling,*;

in (3) Note, under "Search Class" cancel the reference to class 83, Mills;

and in the reference to class 146, Vegetable and Meat Cutters and Comminutors, add:

See particularly subclass 221.5 for processes of hulling grain involving the use of brushes, wipers, etc., and subclass 250+ for apparatus employing such means for grain hulling and see the notes thereto for a statement of the line.

in subclass 3.10, under "Search Class" add:

146—VEGETABLE AND MEAT CUTTERS AND COMMINUTORS, subclass 250+ for grain hulling and cleaning apparatus, and see the notes thereto for the line.

in subclass 256.5 under "Search Class" cancel the reference to class 83, Mills.

18, Plastics (Division 15)

in the main class definition after fourth paragraph add the following:

This class has been made the generic class for the subject matter for the following subclasses and those indented thereunder, regardless of material worked on:

2.4+	**Liquid comminuting and solidifying apparatus**
	Processes
47.2+	Liquid comminuting and solidifying

establish the following subclass definitions:

2.4. Apparatus for forming particles or bodies in which a liquid or melted material is comminuted, and the subdivided particles are solidified without being in contact with a mold or other surface which would impart a shape or form to the particle.

(1) Note.—Apparatus coming within the definition of this and indented subclasses are classified herein regardless of the material treated.

(2) Note.—Apparatus which includes means for agglomerating the particles formed by comminuting a liquid in order to make a molded or shaped object is not classified in this or indented subclasses but is classified in the appropriate class providing for the molding or shaping apparatus.

(3) Note.—Patents claiming both an apparatus for comminuting and solidifying a liquid and the product so produced are classified in the class providing for the product and cross referenced to this or an indented subclass.

Search this class, subclass—

8—for devices for "spinning" non-metallic filaments through a nozzle or spinnerette.

12+—for extruding devices for non-metallic elastic materials.

47.2+—for processes carried out by apparatus classified in this and indented subclasses.

Search Class—

19—TEXTILES, FIBER PREPARATION, subclass 155+ for apparatus for forming webs from mineral wool or other fibers.

22—METAL FOUNDING, subclass 57+, for casting metal in a mold or on a shaping surface.

29—METAL WORKING, subclass 1.22, for apparatus and method for making bullets or shot, usually involving a plurality of metal working operations, and subclass 4.5, for the production of metal shreds by a cutting operation.

49—GLASS, subclasses 1 and 17, for apparatus for melting and blowing of slag or mineral wool combined with coating the wool during the forming step, apparatus including glass furnace structure, and for producing glass filaments by drawing.

91—COATING, subclasses 12.2 and 44+, for apparatus for spraying material for the purpose of coating a base and for spraying apparatus disclosed and claimed broadly.

154—LAMINATED FABRIC AND ANALOGOUS MANUFACTURES, subclass 27, for apparatus for forming insulation by making bats of mineral wool, etc., employing an adhesive binder.

204—CHEMISTRY, ELECTRICAL AND WAVE ENERGY, subclass 298, for coating or forming by cathode sputtering.

207—PLASTIC METAL WORKING, for apparatus for extruding metal.

241—SOLID MATERIAL COMMINUTION OR DISINTEGRATION, subclasses 31 to 301, for apparatus for comminuting solid material, even though combined with a prior comminuting and solidification of a melted material.

2.5. Apparatus under subclass 2.4 in which the liquid or melted material is subjected to the action of a blast or moving stream of an extraneous fluid which effects or aids in the subdivision and/or solidification of the comminuted material.

Search this class, subclass—

47.3—for the corresponding methods.

Search Class—

91—COATING, subclass 12.2, for metal spraying devices for coating, or for metal spraying devices broadly using a fluid blast or current.

2.6. Apparatus under subclass 2.4 which includes a projection means which rotates during operation.

2.7. Apparatus under subclass 2.4 including means for passing the liquid or melted material through a comminuting and/or solidifying medium under the influence of gravity only.

(1) Note.—This subclass includes, for example, "shot towers" in which the liquid is dropped through the air or other fluid in order to comminute and/or solidify the particles.

47.2. Processes of forming particles or bodies in which a liquid or melted material is comminuted and the subdivided particles are solidified without being in contact with a mold or other surface which would impart a shape or form to the particle.

(1) Note.—Processes within the definition of this and indented subclass are classified herein regardless of the material treated.

(2) Note.—Processes including agglomerating the particles formed by comminuting a liquid in order to make a molded or shaped object are not classified in this or indented subclass but are classified in the appropriate class providing for the molding or shaping operation.

(3) Note.—Patents claiming both a process of comminuting a liquid and the product of such process are classified in the appropriate class providing for the product and cross referenced to this or indented subclass.

Search this class, subclass—

2.4+—for the corresponding apparatus.

54—for processes of forming filaments of non-metallic plastic material by extrusion or "spinning" through a nozzle or spinnerette.

Search Class—

22—METAL FOUNDING, subclass 200+ for processes of casting metal in a mold or on a shaping surface.

29—METAL WORKING, subclass 1.22 for apparatus and methods for making bullets or shot, usually involving a plurality of metal working operations and subclass 4.5 for the production of metal shreds by a cutting operation.

49—GLASS, subclass 77.5 for processes of forming mineral fiber combined with the coating of the fibers during forming, or including a specific glass or slag melting step.

117—COATING; PROCESSES AND MISCELLANEOUS PRODUCTS, subclass 106+ for processes of spraying material for the purpose of coating, or when disclosed and claimed broadly.

154—LAMINATED FABRIC AND ANALOGOUS MANUFACTURES, subclasses 28 and 101 for processes of making webs or bats from mineral wool or other fibers in which an adhesive binder is employed.

204—CHEMISTRY, ELECTRICAL AND WAVE ENERGY, subclass 192, for processes of coating or forming by cathode sputtering.

207—PLASTIC METAL WORKING, subclass 10, for processes of die expressing metal.

241—SOLID MATERIAL COMMINUTION OR DISINTEGRATION, subclasses 1 to 30 for processes of comminuting and disintegrating solid materials.

47.3. Processes under subclass 47.2 in which the liquid or melted material is subjected to the action of a blast or moving stream of an extraneous fluid which effects or aids in the subdivision and/or solidification of the comminuted material.

Search this class, subclass—

2.5—for the corresponding apparatus.

19, Textiles, Fiber Preparation (Division 21)

in subclass 41, under "Search Class" cancel the reference to class 83, Mills, and substitute:

146—VEGETABLE AND MEAT CUTTERS AND COMMINUTORS, subclasses 221.5+ and 250+ for related processes and apparatus for delinting cottonseed.

21, Preserving, Disinfecting and Sterilizing (Division 44)

in the main class definition, under "VIII" add in numerical order:

146—VEGETABLE AND MEAT CUTTERS AND COMMINUTORS.

and under "XI", add in numerical order:

146—VEGETABLE AND MEAT CUTTERS AND COMMINUTORS, subclass 250+ for grain cleaning apparatus involving the removal of smut and other organisms by substantial rubbing, abrading, etc.

259—AGITATING, appropriate subclasses for mere mixers for combining disinfecting or sterilizing material with the material to be treated.

23, Chemistry (Division 59)

in subclass 313 cancel (2) Note and add:

Search Class—

18—PLASTICS, subclasses 2.4 and 47.2 for apparatus and process of comminuting and solidifying respectively.

25, Plastic Block and Earthenware Apparatus (Division 33)

in subclass 11 under "Search Class" add in numerical order:

18—PLASTICS, subclass 12+ for die expressing apparatus for plastic material in general.

29, Metal Working (Divisions 13, 14)

in subclass 1.2 in the note change "47" to *92.5*;

in subclass 1.22 under "Search Classes" cancel the reference to class 83, Mills, and add in numerical order:

18—PLASTICS, subclasses 2.4+ and 47.2+.

in subclass 4.5, under "Search Classes" cancel the reference to class 83, Mills, and add in numerical order:

18—PLASTICS, subclasses 2.4+ and 47.2+.

in subclass 155.41, under "Search Class" in the reference to class 18, Plastics, add the following:

"Subclasses 2.4+ and 47.2 provide for the formation of strands and filaments by blowing, centrifugal action etc., in which they are formed without contact with a mold or other shaping surface."

cancel the reference to class 83, Mills.

in subclass 155.56, in (4) Note in the reference to class 18, Plastics, add the following *before* the last sentence thereof:

"Subclasses 2.4+ and 47.2+ provide for apparatus and process for producing particles, etc., by disintegrating a liquid or melted material followed by solidification of the disintegrated material."

also cancel the reference to class 83, Mills;

and under "Search Class" cancel the reference to class 83, Mills.

30, Cutlery (Division 53)

in subclass 3, cancel the notes and substitute:

(2) Note.—Can openers combined with other cutlery implements provided for in this class will be found in subclass 142+, and openers combined with other things, in subclass 123+.

(5) Note.—Can openers having only can cutting means which deform or bend the material of the can during the cutting operation are in this subclass or indented subclasses. Such devices combined with additional means for performing a bending operation are in class 7, COMPOUND TOOLS, subclass 14.2. Such added means may be the configuration of the cutter or other portion of the device which is brought into play after the cutting operation to impose its configuration upon the material.

Search this class, subclass—

2—for openers for paper receptacles.

123+—see (2) Note above.

142+—see (2) Note above.

Search Class—

7—COMPOUND TOOLS, subclasses 14.2 and 14.25, for hand manipulable can openers combined with other hand manipulable tools, and see (5) Note above.

81—TOOLS, subclasses 3.10 to 3.49, inclusive, for receptacle closure removers in general.

220—METALLIC RECEPTACLES, subclass 47+, for metal can opening devices made up as part of the receptacle, or functioning as, or carried by, a closure for the opening formed thereby.

222—DISPENSING, subclasses 5 and 80+, for devices of the type here classified having dispensing characteristics as a part thereof.

34, Drying and Gas or Vapor Contact with Solids (Division 49)

in the main class definition, in (2) Note, in the reference to class 99, Foods and Beverages, cancel the words "for cooling," and add at the end of the reference:

Processes for treating food by gas or vapor contact for moistening are in class 99, but corresponding apparatus for such purposes is provided for in this class (34).

in the reference to class 146, Vegetable and Meat Cutters and Comminutors, add:

See particularly subclasses 221.7+, 227+ and 255+ for processes and apparatus embodying fluid applying for the purposes of that class (146) or in combination with additional steps or means there provided for.

in (3) Note, cancel the reference to class 83, Mills;

in subclass 58, in (3) Note, cancel the reference to class 83, Mills;

in subclass 108, in (8) Note, cancel the reference to class 83, Mills, and add in numerical order:

146—VEGETABLE AND MEAT CUTTERS AND COMMINUTORS, subclasses 276, 292 and 295 for rotary drum grain scourers.

in subclass 171, add

Search Class—

259—AGITATING, subclass 180 for such gravity flow type agitators per se.

43, Fishing, Trapping, and Vermin Destroying (Division 2)

in subclass 144, add the following:

(4) Note.—See class 146, VEGETABLE AND MEAT CUTTERS AND COMMINUTORS, subclass 229, for processes involving applying flame to food material for the purposes of that class.

44, Fuel and Igniting Devices (Division 64)

in subclass 34, in (5) Note, after subclass 10, add: *and subclasses 96 and 97 for absorbent type burners.*

47, Plant Husbandry (Division 1)

in the main class definition, under "Search Classes" add in numerical order:

91—COATING, for apparatus for coating earth products.

99—FOODS AND BEVERAGES, appropriate subclasses for products, processes, and apparatus relating to the preservation and preparation of foods and beverages, including earth products.

134—CLEANING AND LIQUID CONTACT WITH SOLIDS, appropriate subclasses and the notes thereto for apparatus for applying liquid to solid earth products.

146—VEGETABLE AND MEAT CUTTERS AND COMMINUTORS, appropriate subclasses for processes and apparatus relating to the peeling, hulling, comminution, slicing, etc., of vegetable materials.

259—AGITATING, for apparatus for mixing material with earth products.

in subclass 58, add:

(1) Note.—This subclass provides the generic place for processes for preparing seeds for planting. Corresponding apparatus is classified in other classes on the basis of the function or structure of the apparatus involved, in such classes as 34, 91, 134, 146 and 259. See the main class definition of this class (47) for notes to these classes.

Search Class—

34—DRYING AND GAS OR VAPOR CONTACT WITH SOLIDS, see (1) Note above.

91—COATING, see (1) Note above.

99—FOODS AND BEVERAGES, for processes of preparing vegetable material for consumption as food and also miscellaneous food preparation apparatus.

134—CLEANING AND LIQUID CONTACT WITH SOLIDS, see (1) Note above.

146—VEGETABLE AND MEAT CUTTERS AND COMMINUTORS, subclasses 220 to 242, for processes of treating vegetable material including steps of the type there provided for, e. g., husking, peeling, slicing, comminuting, etc.

167—MEDICINES, POISONS AND COSMETICS, subclass 38, for seed disinfecting compositions and seed disinfecting processes distinguished solely by the composition used.

259—AGITATING, see (1) Note.

49, Glass (Division 5)

in subclass 77.5 under "Search Classes" cancel the reference to class 83, Mills, and substitute:

18—PLASTICS, subclasses 2.4+ and 47.2+ for apparatus and processes of comminuting slag and solidifying the comminuted slag. Processes involving comminuting a liquid and solidification combined with coating the comminuted particles during formation are classified in this subclass (77.5).

51, Abrading (Division 58)

In the main class definition, under "Search Class" add in numerical order:

146—VEGETABLE AND MEAT CUTTERS AND COMMINUTORS, appropriate subclasses, particularly subclasses 221.5+, 250+, and 49+ for processes and apparatus for abrading vegetable material for the purposes of that class, usually hulling or peeling. See the notes to the above mentioned subclasses for the line.

In subclass 135, add:

Search Class—

146—VEGETABLE AND MEAT CUTTERS AND COMMINUTORS, subclass 291 for endless belt abrading grain hullers.

In subclass 163, under "Search Class" add in numerical order:

146—VEGETABLE AND MEAT CUTTERS AND COMMINUTORS, subclasses 250+ and 49+ for hulling or peeling apparatus including abrasion by tumbling but in which the material is contacted by an abrading tool.

In subclass 164, under "Search Class" add in numerical order:

146—VEGETABLE AND MEAT CUTTERS AND COMMINUTORS, subclasses 276, 292, 295 and 49+ for rotary drum vegetable abraders for hulling and peeling.

In subclass 281, under "Search Class", add in numerical order:

146—VEGETABLE AND MEAT CUTTERS AND COMMINUTORS, appropriate subclasses, particularly subclasses 221.5+, 226 and 241, for processes of abrading vegetable materials for the purposes of that class.

In subclass 282, under "Search Class", add in numerical order:

146—VEGETABLE AND MEAT CUTTERS AND COMMINUTORS, subclasses 221.6 and 226 for corresponding processes for peeling or hulling vegetable material.

In subclass 293, under "Search Class", cancel the reference to class 83, Mills.

56, Harvesters (Division 5)

In subclass 10 add:

Search this class, subclass—

328—for motor operated fruit and nut gatherers.

64, Machine Elements, Shafting and Flexible Shaft Couplings (Division 45)

In subclass 27, under (1) Note, after "subclass 574." add:

and where a control lever and linkage system has resilient connection therein, see this same class (74) subclass 470.

In subclass 28, under "Search Class" in the reference to class 74, Machine Elements and Mechanisms, cancel:

—subclass 549, for handles with yieldable shaft connections; and—

68, Textiles, Fluid Treating Apparatus (Divisions 2, 27)

In subclass 184, cancel notes 2 and 3 and substitute:

Search this class, subclass—

18—for similar machines used with filters.
51—for combined liquid pumping and squeezing machines.
131+—for machines using agitators of the impulsing type.
207—for machines for effecting a flow of liquid due to the injection into the tank of a vapor or liquid.

71, Chemistry, Fertilizers (Division 59)

In subclass 64, in (2) Note, cancel "83, Mills, subclass 91" and substitute: *18, Plastics, subclass 47.2+,*

73, Measuring and Testing (Division 36)

In the main class definition, under (3) Note in the reference to G. Radiant Energy: under class 250, Radiant Energy, add in numerical order:

1.50—for miscellaneous apparatus and methods which involve the use of a reflected and/or otherwise returned wave (radar) system for detecting an object, or to measure the distance, direction and/or velocity of an object.

under H. Speed Measuring: cancel the reference to class 250, Radiant Energy, and substitute:

250—RADIANT ENERGY, appropriate subclasses, for those utilizing transmitted radiant energy, see subclass 1.50 for those utilizing reflected or otherwise returned wave (radar) energy.

74, Machine Elements and Mechanisms (Divisions 12 and 45)

Abolish subclass 549.

81, Tools (Division 29)

In subclass 15.3 cancel the definition and note and substitute:

15.3. Devices under subclass 15.2 comprising means for holding tire casings in deformed position for inspection, repairs or other purposes.

(1) Note.—The devices classified herein are mere holders and are provided with no means adapting them to use in applying force to spread the tire beads, such spreaders being provided for in class 254, PUSHING AND PULLING IMPLEMENTS, subclasses 50.1+ or are referred to in the notes.

(2) Note.—The devices classified in this subclass are implements adapted to be supported by the casing and afford no support for the tire. Apparatus for a similar use, but provided with means to support the tire, are in class 154, LAMINATED FABRIC AND ANALOGOUS MANUFACTURES, subclass 9.

Search Class—

154—LAMINATED FABRIC AND ANALOGOUS MANUFACTURES, subclass 9, see (2) Note above.
254—PUSHING AND PULLING IMPLEMENTS, subclass 50.1+, see (1) Note above.

In subclass 52.4, under "Search Class", cancel the reference to class 74, Machine Elements and Mechanisms.

91, Coating (Division 46)

In the main class definition, add the following:

(13) Note.—See class 259, AGITATING, appropriate subclasses for agitating apparatus which may be disclosed as involving a coating function but comprising merely means to agitate particulate base material with particulate or liquid coating material. Class 259 does not provide for additional operations such as separation of the coated base from the coating material or vice versa, such combinations being classified in this class (91) or other class appropriate thereto.

In subclass 7, add the following:

Search Class—

259—AGITATING, appropriate subclasses and see (13) note to the main class definition of this class (91).

In subclass 52, under "(2) Search Classes", add in numerical order:

259—AGITATING, appropriate subclasses, and see (13) note to the main class definition of this class (91).

92, Paper Making and Fiber Liberation (Division 56)

In subclass 7, under "(2) Search Classes", cancel the reference to class 83, Mills, and add in numerical order:

146—VEGETABLE AND MEAT CUTTERS AND COMMINUTORS, subclass 227+ for processes for removing fibrous integuments from vegetable material by fluid application.

In subclass 27, under "Search Class", cancel the reference to class 83, Mills, and add in numerical order:

146—VEGETABLE AND MEAT CUTTERS AND COMMINUTORS, subclasses 279 and 300+.

In subclass 29, under "Search Classes", cancel the reference to class 83, Mills.

In subclass 33, under "(2) Search Classes", cancel the reference to class 83, Mills.

99, Foods and Beverages (Divisions 1, 63)

In the main class definition, cancel (8) Note, and in (13) Note, after "cutting," insert: *hulling, peeling,*

In subclass 80, under "Search Class", add in numerical order:

34—DRYING AND GAS OR VAPOR CONTACT WITH SOLIDS, for drying or gas or vapor treatment of grain and see the statement of the line in the main class definition of class 34.
47—PLANT HUSBANDRY, subclass 58 for processes of treating seed for planting.
146—VEGETABLE AND MEAT CUTTERS AND COMMINUTORS, subclasses 220 to 242, particularly subclass 221.5+, for processes of treating cereal grains for the purposes of that class, i. e., hulling, scouring, etc.

In subclass 237, cancel (2) Note, and add the following:

Search Class—

34—DRYING AND GAS OR VAPOR CONTACT WITH SOLIDS, for apparatus for drying or applying gas or vapor to grain for various purposes and see the statement of the line in the main class definition of class 34.
134—CLEANING AND LIQUID CONTACT WITH SOLIDS, and the notes thereto for apparatus for cleaning or applying liquid to grain for other purposes and see the main class definition of that class for the line.
146—VEGETABLE AND MEAT CUTTERS AND COMMINUTORS, for apparatus for grain hulling, scouring, slicing, etc., as provided for by the definitions of that class.
241—SOLID MATERIAL COMMINUTION OR DISINTEGRATION, for apparatus for comminuting grain.

106, Compositions, Coating or Plastic (Divisions 38 and 64)

In subclass 50, under (3) Note, cancel "83, Mills, subclass 91" and substitute: *18, Plastics, subclass 47.2+*

110, Furnaces (Division 19)

In subclass 180, under "(2) Search Classes" add:

263—HEATING, subclass 44, for furnace cooling there provided for.

126, Stoves and Furnaces (Division 19)

In subclass 369, under "(3) Search Classes", cancel the reference to class 83, Mills.

127, Sugar, Starch and Carbohydrates (Division 43)

In subclass 67, under "Search Class", add in numerical order:

146—VEGETABLE AND MEAT CUTTERS AND COMMINUTORS, appropriate subclasses, particularly subclass 221.5+, for processes of removing husks from grain.

In subclass 68, under "(2) Search Classes", cancel the reference to class 83, Mills, and add in numerical order:

99—FOODS AND BEVERAGES, and the notes thereto. This is the generic class for the treatment of grain by fluids for processing into food.

134, Cleaning and Liquid Contact with Solids (Division 27)

In the main class definition, under "Notes" in (1) under "Search Class", cancel the reference to class 83, Mills, and add in numerical order:

47—PLANT HUSBANDRY, subclass 58, for processes of preparing vegetable seed for planting, including liquid application.

and in the reference to class 146, Vegetable and Meat Cutters and Comminutors, add at the end of the reference:

However, class 146, subclass 250+, provides for devices in which grain is subjected to an appreciable abrading or rubbing for the disclosed purpose of cleaning. See (3) Note to the definition of subclass 250 of class 146.

under "Notes" in (4) under "Search Class", in the reference to class 209, Classifying, Separating and Assorting Solids, add at the end of the reference:

Processes and apparatus in which the liquid used to promote separation of the solids into grades is disclosed and/or claimed as also treating the solids for purposes in addition to separation is not provided for in class 134 but in class 209 or other appropriate class.

and in the reference to class 259, Agitating, add at the end of the reference:

Liquid contacting agitators combined with other devices not provided for as combinations in class 259 (see the class definition of that class), e. g., means to separate the contact liquid from the treated solid, are provided for in this class (134) or other appropriate class according to the lines therebetween.

In subclass 7, under "Search Class", add in numerical order:

146—VEGETABLE AND MEAT CUTTERS AND COMMINUTORS, subclasses 221.6 and 252 for processes and apparatus of the type there provided for including the use of a particulate solid work treating agent.

146, Vegetable and Meat Cutters and Comminutors (Division 25)

In the main class definition, paragraph 1, after the word "meats," insert: *the removal of husks from grain,* under "Notes" under (1) in the reference to class 99, Foods and Beverages, section "(c)", at the end of the reference add: *However, see (3) Note in the definition of subclass 250 of this class (146).*

under "Notes" under (3), add the following in numerical order:

47—PLANT HUSBANDRY, appropriate subclasses, particularly subclass 58 for processes and apparatus for testing and treating seed grain in preparation for planting.

and cancel the reference to class 51, and substitute:

51—ABRADING, for abrading processes and apparatus of general application. Processes of abrading meat and vegetables for the purposes of this class (hulling, disintegrating, etc.), are provided for in the appropriate process subclasses of class 146. Class 146 provides for abrading apparatus in such subclasses as 250+ and 49+, but see (2) Note to the subclass definition of subclass 250 for a further statement of the line.

In subclass 8, cancel the note and add:

Search this class, subclass—

7—for devices of similar character operating on coconuts.
32—for devices for removing the skins from nuts.
250+—for similar devices for removing the husks from grain.

In subclass 9, add:

Search this class, subclass—

225—for corresponding processes.
253—for similar devices operating on grain.

Search Class—

241—SOLID MATERIAL COMMINUTION OR DISINTEGRATION, subclasses 5, 39+, and 275 for similar comminutors.

In subclass 13, cancel the note, and add:

Search Class—

81—TOOLS, for vises, tongs and pipe wrenches.
241—SOLID MATERIAL COMMINUTION OR DISINTEGRATION, subclass 168+, for hand supported and operated comminutors.

In subclass 32, cancel the note, and add:

Search this class, subclass—

49+—for abrading type peelers and parers for other vegetable material.
250+—for similar apparatus for removing the husks from grain.

In subclass 49, add the following:

Search this class, subclass—

32—for abrading type nut skinners.
250+—for abrading type grain huskers.

Search Class—

51—ABRADING, for abrading processes and apparatus of general application.

In subclass 76, insert:

Search this class, subclass—

222—for corresponding processes.
280+—for grain huskers combined with separating means.

establish the following subclass definitions:

221.5. Processes under the class definition in which naturally occurring integuments are removed from grain kernels or parts thereof by subjecting the grain to the mechanical action of a solid agent.

(1) Note.—Hulling processes employing mere agitation of the grain for the purpose of (1) effecting mutual attrition of the grains on each other, (2) for better presentation of the grain surfaces to the action of a fluid, or (3) for some other purpose, are not considered treatment by a solid agent for this group, but will be found in other appropriate subclasses of this class or will be referred to in the notes thereof.

(2) Note.—The term "grain" is considered to include those small seeds to which the term is ordinarily applied, i. e., wheat, corn, oats, barley, coffee beans, cottonseed, etc., and to exclude larger vegetables such as nuts, beets, etc.

(3) Note.—Processes of cleaning extraneous matter from grain, in contradistinction to naturally occurring parts of the grain, are not found here but in the appropriate subclasses of class 99 or other appropriate classes.

Search this class, subclass—
222 to **229, 232+, 235**—for grain hulling processes not involving the use of a solid work treating agent.
230+—for corresponding processes applied to vegetable material other than grain.
250+—for corresponding grain hulling apparatus.

Search Class—
99—FOODS AND BEVERAGES, see (3) Note above.
241—SOLID MATERIAL COMMINUTION OR DISINTEGRATION, appropriate subclasses, particularly subclass 7 for processes of comminuting grain and processes including both hulling and comminution. Since the hulling operation classified here (146) will, in most cases, divide the hull portion into a number of pieces, only those processes which effect the breaking of the grain body (endosperm) into a plurality of pieces are to be considered combined hulling-comminution processes for class 241.

221.6. Processes under subclass 221.5 in which loose abrasive material is employed as the solid work treating agent.

Search this class, subclass—
252—for corresponding apparatus.

Search Class—
51—ABRADING, subclass 282, and the notes thereto for such processes in general.
241—SOLID MATERIAL COMMINUTION OR DISINTEGRATION, subclass 22, for comminuting processes including applying solids to the material.

221.7. Processes under subclass 221.5 involving (1) heating, (2) cooling, or (3) the application of chemicals or fluids to the grain or any combination of (1), (2) and (3).

Search this class, subclass—
230+—for similar processes applied to material other than grain.
255+—for hulling apparatus involving fluid applying means.

221.8. Processes under subclass 221.7 in which a fluid is applied to the grain prior to or coincident with the hulling operation for the purpose of moistening the grain or carrying out a chemical reaction with some part thereof.

Search this class, subclass—
231—for such processes applied to material other than grain.
268+—for hulling apparatus provided with means to apply a fluid to the grain prior to hulling.

221.9. Processes under subclass 221.8 in which the grain is subjected to a heating, cooling and/or fluid applying treatment in addition to the moistening or chemical treatment.

Search this class, subclass—
261+, 267, 268 and **270**—for hulling apparatus involving plural fluid applying.

in subclass 222, under "Search this class, subclass", add in numerical order:

76—for corresponding apparatus combinations.
221.5+—for grain hulling processes including separation steps.
280+—for grain hulling apparatus provided with separating means.

in subclass 224, add the following:

Search this class, subclass—
254—for grain orienting means in hulling combinations.

in subclass 226, under "Search Class", add in numerical order:

51—ABRADING, subclass 282, for processes of abrading by tumbling in general. Corresponding processes of abrading meat and vegetables by mere tumbling for the purposes of this class are provided for in this subclass (226).

in subclass 227, under "Search this class, subclass", add in numerical order:

221.7+—for grain hulling processes including the use of the additional steps provided for in this subclass. This subclass (227) and those indented hereunder provide for grain hulling processes of the type defined above, which do not include the use of a solid work treating agent.

in subclass 230, under "Search this class, subclass", add in numerical order:

50—for abrading type peelers having liquid applying means.
221.5+—for grain hulling processes including the use of a solid work treating agent.
255+—for grain hulling apparatus employing a solid work treating agent combined with fluid applying means.

in subclass 241, under "Search this class, subclass", add in numerical order:

221.5+—for grain hulling processes.

establish the following subclass definitions:

250. Apparatus under the class definition for removing material (either naturally occurring skins or husks or adhering impurities) from the surface of grain or grain parts by a scouring, abrading, or impact action by an abrading surface or other type surface.

(1) Note.—The term "grain" is interpreted to include those small seeds to which the term is ordinarily applied, e. g., wheat, corn, oats, barley, coffee beans, cottonseed, etc. and to exclude larger vegetables such as potatoes, beets, etc. the treatment of which is provided for in other appropriate subclasses of this class or other classes.

(2) Note.—The above limitation to action by "an abrading surface or other type surface" is intended to exclude from this group mere tumbling devices (i. e., rotary drums or other moving receptacles which present no abrasive or other material removing surface to the grain) for effecting mutual abrasion only between the grains for hulling or cleaning, such devices being classified in the appropriate subclasses of classes 51, 259 or other appropriate classes in accordance with the line between those classes. However, receptacles, whether moving or stationary, when provided with relatively movable grain contacting members which move the grain in the receptacle for the disclosed purpose of removing the husk or adhering impurities (see (3) Note), are provided for in this class even though the action on the grain is limited to mere mutual abrasion. Combinations, which include both mere mutual abrasion by tumbling in a moving receptacle and the use of an abrading or other material removing surface, are provided for in this and the indented subclasses.

(3) Note.—Most of the devices classified in this or the indented subclasses are for the disclosed purpose of removing husks, skins, or other naturally occurring integuments from grains. However, because of the similarity of their structure to hullers some devices disclosed as mere cleaners (to remove adhering impurities) are included when the cleaner is of such a nature as to subject the grain to an appreciable rubbing, abrasion or impact action by a solid work treating surface or agent. Devices disclosed as mere cleaners and not involving appreciable abrasion or impact action will be found in the generic cleaning class 134, CLEANING AND LIQUID CONTACT WITH SOLIDS, or some other cleaning class according to the notes appended to the main class definition of class 134.

Search this class, subclass—
8+—for power operated devices for removing husks and shells from nuts.
32—for devices for removing skins from nuts.
49+—for abrader type vegetable peelers in general.
221.5+—for corresponding grain hulling processes.

Search Class—
15—BRUSHING, SCRUBBING, AND GENERAL CLEANING, subclass 3.10+, for grain cleaners employing the instrumentalities provided for in that class, e. g., brushes and wipers. See subclass 299 of this class (146) for hullers employing brushes or wipers.
51—ABRADING, see (2) Note above.
134—CLEANING AND LIQUID CONTACT WITH SOLIDS, see (3) Note above.
241—SOLID MATERIAL COMMINUTION OR DISINTEGRATION, for grain comminuting devices having structure similar to the devices classified herein and for combinations of grain hullers of the type classified here, with comminutors (see subclasses 7 and 101 of that class). Since most of the hullers classified here inherently divide the husk or adhering impurities into a number of pieces in the process of removal from the grain, only such devices disclosed as effecting the division of the grain body (endosperm) into a plurality of parts should be considered comminutors or comminutor-huller combinations for class 241.
259—AGITATING, see (2) Note above.

251. Apparatus under subclass 250 provided with means to sense a condition, which means causes the operation of a control device.

(1) Note.—Hulling members, valve bodies and like members, which are contacted and moved directly by the material, are excluded and will be found classified in an appropriate subclass below.

Search this class, subclass—
282+—for non-automatic feed control devices.
297+—for yieldably mounted hulling members.

Search Class—
34—DRYING AND GAS OR VAPOR CONTACT WITH SOLIDS, subclass 43+, and the notes thereto for automatic control of apparatus for applying gas to solids.
192—CLUTCHES AND POWER-STOP CONTROL, subclass 116.5+, for automatically controlled stop mechanisms of general application.
222—DISPENSING, subclass 52+ and the notes thereto for dispensers having automatic controls.
241—SOLID MATERIAL COMMINUTION OR DISINTEGRATION, subclass 33+, for automatically controlled comminutor organizations.

252. Apparatus under subclass 250 provided with means to feed loose abrasive material or articles into contact with the grain.

Search this class, subclass—
221.6—for corresponding processes.

Search Class—
51—ABRADING, subclasses 8+, 163+, 263+, and 282 for abrading processes and apparatus in general employing loose abrasives.
259—AGITATING, appropriate subclasses for mere agitators for abrasive and grain. See (2) Note in the definition of subclass 250.

253. Apparatus under subclass 250, provided with means to project the grain through space into contact with a hulling surface which does not form part of the projecting instrumentality.

(1) Note.—The projecting of the grain may be accomplished by gravity, centrifugal force, fluid current, or other means.

Search this class, subclass—
9—for centrifugal impact nut crackers.
225—for processes employing centrifugal force on vegetable material other than grain.

Search Class—
241—SOLID MATERIAL COMMINUTION OR DISINTEGRATION, subclasses 5, 39+ and 275 for corresponding comminuting processes and apparatus.

254. Apparatus under subclass 250, provided with means which moves the individual grains to, or maintains the grains in, a desired position relative to a hulling member during at least a portion of the hulling operation.

Search this class, subclass—
224—for corresponding processes applied to vegetable material other than grain.

Search Class—
193—CONVEYORS, CHUTES, SKIDS, GUIDES AND WAYS, subclass 43, for gravity guides with orienting means.
198—CONVEYORS, POWER DRIVEN, subclass 33, for power driven conveyors having orienting means.
